The Phanariots and their wide influence in the Ottoman empire were viewed – even during their lifetime – from differing perspectives. In popular sentiment they were often identified with the Ottoman rulers and were criticized for having served principally their own interests in wealth, power, and prestige, and indirectly those of the Ottomans. As such, they were portrayed as oppressors of the Greek people (e.g. in the satirical poem *Rossanglogallos* at the beginning of the 19th century, which was directed against all the ruling elites of pre-independence Greece). They were also thought to have complete control of the Orthodox Church. From the middle of the 18th century there was an attempt to marginalize the Phanariots, initiated by an emerging Greek social class, led principally by merchants, who during the Greek Enlightenment sought positions of power and influence within society. There were also other critiques of Phanariot policies at a more sophisticated level, e.g. by Adamantios Korais. The most devastating attack on the Phanariot aristocracy was that by the physician Marc-Philippe Zallony in 1824, who depicted them as intriguers, ambitious, greedy, and totally neglectful of

the Greek population of the Ottoman empire. It is no wonder then that the designation "Phanariot" was sometimes used pejoratively to indicate a love for intrigue and rapacity. It is true that the Phanariots in the principalities were influenced by the feudal traditions of the previous Romanian landowners, a fact that changed the early bourgeois character of their social class and transformed them into a feudal aristocracy. Aside from these, the Phanariots were accused by Romanian historians and others of neglecting the individuality of the Romanian lands and of serving Greek interests by the imposition of Hellenism. Thus, they failed to identify with the aspirations of the Romanian people. Yet, it is also argued that the intellectual endeavours of the Phanariots exerted a major impact upon other Balkan peoples generally (e.g. the Romanians), since the Hellenization process in southeastern Europe was of utmost importance for the cultural development of these regions. Moreover, to spread the Greek language and education at that time in the greater Balkan area was not the same as the promotion of a Greek national identity.

Despite these negative assessments of the Phanariots and their social class, it cannot be denied that their rise to high positions in the Ottoman administration did not serve Ottoman interests alone, but had beneficial repercussions for the Greek population too. It should not be forgotten that court machinations and illicit give-and-take were the principal means of survival within the corrupt Ottoman system. The Phanariots were no exception to this prevailing tradition. And indirectly, they played a significant role in the articulation of political and intellectual aspects of Greek life. In the Phanariots the subject Greek people acquired an influential political entity that functioned both as a shelter for the development of letters and as a source of considerable prestige. Nor should it be forgotten that many Phanariots were executed by the Ottomans in retaliation for their activities and those of other Greek subjects. This proves that the Ottoman authorities considered the Phanariots as being close to the Greek people and their cause. As mentioned above, the Phanariots envisaged a restoration of the Byzantine empire with its centre in Constantinople. But this does not mean that the Phanariots were entirely against the Greek War of Independence. After all, it was Alexandros Ypsilantis (1792–1828) who started the unsuccessful Greek uprising in the principalities in 1821. Several other Phanariots (e.g. Dimitrios Ypsilantis, 1792–1832; Alexandros Mavrokordatos, 1791–1865) played a significant role later in the Greek War of Independence. The outbreak of this war led to a massacre of many Phanariots in Constantinople and brought an end to their power. Of those that survived, some remained in Turkey, some settled in Greece and Romania, while others emigrated to the West.

All in all, the Phanariots, aside from their caste system and their various ambitions, did act as catalysts for significant developments in the Ottoman empire vis-à-vis the Greek Orthodox population, and it was through their mediation that the first substantial encounter of the Greek world under Ottoman rule with western Europe before the Greek Enlightenment took place. Generally, they showed a bipolarity in their overall orientations and activities, oscillating between preserving traditions and introducing innovations in various fields. Their many critics and their undeniable flaws notwithstanding, the Phanariots represented a distinguished chapter in the history of post-Byzantine Hellenism that left an indelible mark upon eastern Europe.

Summary

The Phanariots, originally Greek Christian residents of the Phanar district in Constantinople, formed a social, economic, and political elite under Ottoman rule. From the 17th century on they held important positions in the Ottoman administration, notably as interpreters to the Sublime Porte and as princes of the Danubian principalities of Moldavia and Wallachia. They played a significant role in the survival of Hellenism both politically and culturally.

Phidias

Athenian artist of the 5th century BC

Phidias, son of Charmides, was Athens' most prominent artist in the period between the start of the radical democracy and the beginning of the Peloponnesian War (*c.*462–431 BC). He was probably born around 490 BC. He was reputedly a pupil of Hegias and Hageladas of Argos (who also were supposed to be the teachers of Myron and Polyclitus), who introduced him to the new technique of bronze casting.

His earliest works can be dated only approximatively: they are a group of bronze statues in the sanctuary of Delphi, showing the victorious Athenian general Miltiades surrounded by gods and heroes (Pausanias, 10. 10. 1); an over-lifesize statue of *Athena Areia* (with a height of more than 3 m), whose clothes were of gold and flesh of marble, for a newly built temple at Plataea (Pausanias, 9. 4. 1; Plutarch, *Aristides*, 20; probably recognizable in the so-called Athena "Medici" type); and a giant bronze statue (about 9 m) of *Athena Promachos* ("front-fighter") on the Acropolis of Athens (Pausanias, 1. 28. 2). All these monuments were commissioned by the Athenian state as memorials of the victories at Marathon (490 BC), Plataea, and Salamis (480/79 BC); today it is widely believed that they were constructed around 460 BC, when because of its foreign policy situation (tensions with Sparta and Thebes) Athens was very much inclined to point to its leading role in the Persian Wars.

These works must already have won Phidias great fame by the middle of the 5th century BC; he apparently had connections with influential people in the city (above all Pericles) who decided what was to be built at Athens and by which artist. So when in 448 BC the city decided to rebuild the Parthenon with a huge statue of Athena Parthenos, Phidias was again commissioned to create this statue. More controversial is the question of how big a role Phidias really played in the building of the Parthenon itself and how many of its pediments, metopes, and friezes were really made by him: Plutarch (*Pericles*, 13) calls him "overseer" (*episkopos*) and credits him with a near-omnipotent role as leader and organizer; this, however, does not fit very well with our knowledge of democratic Athens, where many people had a surprisingly large say even in matters of art. On the other hand, the coherent conception of the building's exterior sculpture and its many connections with Athena Parthenos indicate that Phidias must have been at least a very influential supplier of ideas.

Phidias' fame rested chiefly on his *Athena Parthenos* and his *Olympian Zeus* (see below). Both were made of gold and ivory laid over a wooden core and additionally decorated with other precious materials. The *Athena* was 12 m high and her garments consisted of more than a ton of gold (consuming a sizeable part of the state treasury of Athens); her extended right hand held a Nike (goddess of victory), her left a spear and a shield embellished on the outside with an Amazonomachy, on the inside with a Gigantomachy; furthermore, a snake (the symbol of the mythical Athenian king Erechtheus) was curled up inside the shield. Lapiths and Centaurs adorned Athena's sandals, and her pedestal displayed the birth of Pandora in relief. At the centre of her aegis a Gorgon was displayed, and the triple crest of her helmet sported a sphinx and two Pegasi, its cheek-pieces griffins. The statue was finished in 438 BC, the exterior sculpture of the Parthenon in 432 BC. During this time Phidias had several other, minor public commissions: the statue of *Athena Lemnia*, also on the Acropolis; the so-called *Mattei Amazon* for a contest in Ephesus; and a cult statue of *Aphrodite Ourania* ("the heavenly") for Elis near Olympia.

Plutarch (*Pericles*, 31f.) reports that Pericles' enemies prosecuted Phidias for allegedly embezzling ivory from *Athena Parthenos* and for blasphemy (because he allegedly included his and Pericles' portrait on the *Parthenos*' shield); but the evidence for this trial (about 434 BC) is very contradictory, and Phidias' death in prison is almost surely a later fiction, for his workshop at Olympia, which has been found (with tools, terracotta moulds, and even a cup bearing his name), must be dated to the 430s BC. The *Olympian Zeus* (Strabo, 8. 353f.; Pausanias, 5. 10. 2ff.) was even bigger than the *Parthenos*: enthroned, he held a Nike in his right hand and a sceptre in his left; the throne itself was richly embellished with Graces, Seasons, Nikai, Sphinxes, the slaughter of the children of the Theban queen Niobe, and an Amazonomachy; Phidias' brother or nephew Panaenus decorated the screens between the legs of the statue with paintings of *Hellas and Salamis*, some of the *Labours of Heracles*, *Hippodamia and Sterope*, and *Achilles and Penthesilea*. Another Amazonomachy could be seen on Zeus' footstool, and the statue's pedestal showed the birth of Aphrodite. At some point in the 420s BC Phidias disappears from our sources; according to some, he was killed by the people of Elis, but there is no real evidence for this.

Reliable sources for Phidias' life are few; brief mentions by Aristophanes (*Peace*, 605–18) and Plato (*Meno*, 91d; *Protagoras*, 311c) provide the only contemporary written testimony; more informative, but not always reliable, is Plutarch's *Life of Pericles* (late 1st century AD). In his *Olympic Discourse* of AD 97 Dio Chrysostom stages an imaginary defence of the *Olympian Zeus* by Phidias himself against those who doubt

Phidias: copy of the statue of Athena (the Minerva with Collar) by Phidias, Louvre, Paris

that the majesty of a god can be rendered in human form; and in the 3rd century AD the Neoplatonist philosopher Plotinus pays an even more handsome tribute to this statue, which became one of the seven wonders of the world: he says (*Ennead*, 5. 8. 1) that Phidias did not make it from any earthly model, but that his imagination grasped what Zeus would look like if he wanted to make himself visible.

We do not really know what happened to Phidias' works in later antiquity. By the end of the 5th century AD most of them had probably already been destroyed; what at this time still survived of valuable artwork was in most cases transferred either to Rome or to Constantinople (the Neoplatonist Marinus (*Vita Procli*, 30) records that *Athena Parthenos* was taken out of the Parthenon during the lifetime of his teacher Proclus, but says nothing about the further fate of the statue). Probably the last mention of a work of Phidias may be found in the account of Niketas Choniates (*c.*1155–1217) that a statue of Athena (possibly the Promachos from the Acropolis) was destroyed by a raging mob who believed that her outstretched hand had lured foreign enemies into the city of Constantinople.

Biography

Born *c.*490 BC the son of Charmides, Phidias was the most famous artist of 5th-century Athens. He was said to have been a pupil of Hegias and Hageladas of Argos. His fame rested largely on his statues of Athena Promachos for the Parthenon and of Zeus for Olympia. The extent of his role as overseer of the Parthenon as a whole is uncertain. He died probably in the 420s BC.

Philhellenes

The term "philhellene" was first used in ancient Greece with regard to allies of the Greeks or to foreign rulers who imitated Greek ways. With the revival of interest in Greek culture and civilization during the Renaissance the term began to be used of any admirer of the ancient Greeks.

However, the established sense of philhellenism focuses on a multi-faceted yet specific 19th-century historical phenomenon, the manifold support by foreigners for the struggle of the Greeks for independence, particularly during the war years 1821–30. Philhellenism in this sense is sometimes defined in vague or contradictory terms; despite some good monographs on the subject, there is still room for an in-depth analysis and new interpretations.

Philhellenism should be seen in the context of 19th-century European cultural and political trends, notably Clacissism, Romanticism, and above all liberalism and radicalism. An all-embracing analysis of the phenomenon must take account of all the forms in which support for the Greek struggle for liberation and the establishment of a modern Greek state expressed itself.

Philhellenes: memorial to the philhellenes in the church of the Transfiguration, Nauplia. Nauplia played a major part in the War of Independence.

Up to the late 18th century interest in Greece was confined to an admiration for classicism by members of the educated middle and upper classes of western Europe. There was a steady stream of foreign travellers visiting the very lands where Greek civilization was born and flourished, and their numbers increased considerably in the early years of the 19th century. On their return home many of them published their impressions from the Levant, but – significantly and in contrast with earlier accounts – the new emphasis was not only on the material remains of ancient Greek civilization but also on the modern inhabitants of the region, who were now presented as having a direct link with the celebrated figures of antiquity. Manifestations of continuity with the Classical past were eagerly sought and publicized; the degenerate state of the contemporary Greeks was attributed to their harsh fate under the domination of infidels, while their aspirations for independence found a sympathetic response. The wave of sympathy was inflamed by the romantic movement and its widely circulating literary products with an oriental theme, the most influential being those by Byron (*Childe Harold's Pilgrimage* and *The Giaour*) and Chataubriand (*Les Martyres* and *Itinéraire de Paris à Jerusalem*).

Coming as it did soon after the national/liberal insurrections in other parts of Europe, the outbreak of the Greek revolution was viewed with great hostility by the European powers which, ever since the Congress of Vienna (1815) had been striving to maintain the status quo and not challenge the legitimacy of sovereigns. Predictably, this negative reaction on the part of a repressive establishment united the opposing forces in a common front supporting the Greek cause. They came from all walks of life: there were liberal and radical university students, Classical scholars and intellectuals; decommissioned soldiers of the now underactive European armies, persecuted Bonapartists, political refugees from repressive regimes, and former fighters of the failed risings in Spain, Portugal, and Italy; Christian philanthropists, social reformers, and even plain adventurers, dropouts, and speculators.

A great number of the philhellenes who would take active part in the conflict headed for Greece in the first year of the war. They generally had unrealistic expectations of the situation in the field and of the role they were destined to play themselves. Many were soon to be disillusioned by the almost total absence of planning and organization, the lack of pay, and the shortage of supplies. They could not understand or participate effectively in the traditional method of warfare practised in the region, which was based on undisciplined irregulars and had little use for regular soldiery of the European type. The harsh conditions, the war atrocities, and

the infighting for dominance among the Greek factions compounded their disappointment. Although westernized leaders of the Greeks made repeated attempts to organize a regular corps of foreign volunteers, such corps were shortlived and made little impact on military developments. After the decimation of a philhellenic battalion at the Battle of Peta (September 1822) the first phase of philhellenic activity in the field virtually came to an end.

Nevertheless, the movement continued and philhellenic committees were founded by philhellenes and Greeks of the diaspora in many European and American cities. Their aims were to promote the Greek cause with publications and appeals, to make collections, and organize military and humanitarian aid. Meanwhile the stream of new volunteers arriving in Greece was never interrupted, but it increased dramatically following the revival of philhellenic feeling in 1825, in the aftermath of Byron's death at Missolonghi and the subsequent heroic struggle and dramatic fall of the town of Missolonghi itself. In the meantime, the staying power of the insurgents had made the European governments reconsider the status quo in the eastern Mediterranean, where there was an increasing antagonism between Russia, France, and Britain, as each of the three wanted to expand its influence and trading interests in the region. This resulted in an uneasy triple alliance which, following the Battle of Navarino (1827), negotiated the establishment of the modern Greek state.

The number of people who helped the Greek cause systematically, many of them without ever having set foot in Greece, is impossible to estimate, but it is thought that around 1200 foreign volunteers participated in the war. These last came from all over Europe, but mostly from Germany, followed by France, Italy, and Britain, with a strong presence of Irish and Scots. Smaller numbers came from Switzerland, Poland, the Low Countries, and the United States; there were also Scandinavians and Spaniards. Some of the foreign professional officers – for example, Karl Normann, Charles Fabvier, Richard Church, Frank Abney Hastings, and Thomas Gordon – assumed roles of military leadership and participated in major battles, but on balance the military contribution of foreign volunteers was not a decisive factor in the outcome of the war. Their symbolic contribution to the Greek cause far outstripped their practical help.

While in most cases of philhellenism it is difficult to disentangle genuine affection for the Greeks and a sincere solidarity with their cause from other considerations, this is not the case with politicians of that period who pursued policies favourable to the Greek cause (a notable example is George Canning); therefore, they should not strictly be ranked among the philhellenes. However, in the category of philhellenes belong, along with the soldiers, a great number of others who supported the Greeks in many different ways. There were prominent figures who gave financial, moral, and ideological support, such as Charles James Napier and Frederick North (later Earl of Guildford) or Samuel Gridley Howe, who not only offered his services as a doctor during the war, but also toured America to collect donations for the Greek cause and organized relief for the war refugees. There were academics who became the guiding force in Greek committees, such as Professor Thiersch. There were theorists such as Jeremy Bentham, who prepared a draft for the Greek constitution, and reformers such as Leicester Stanhope, who promoted liberal and educational reforms in Greece. There were businessmen and philanthropists, such as Jean-Gabriel Eynard, who worked indefatigably, using his international contacts, personal funds, and organizational skills for the regeneration of Greece, both before, during, and after the liberation. Many of these people have left histories of the war, or first-hand accounts of their efforts and experiences in Greece (e.g. Maxime Raybaud, Howe, Gordon, George Finlay, or William Humphreys).

Most of the survivors who had come to Greece as volunteers did not stay in the country for long and, with few exceptions, left after the liberation. However, the philhellenic movement did not die with the end of the War of Independence. Ardent philhellenes, such as King Ludwig I of Bavaria, continued to show an active interest in the country. In the years to come philhellenic sentiments, generating humanitarian relief and even military aid, likewise kept surfacing during insurrections in the unliberated parts of Greece throughout the 19th century. As late as 1896–97 there was a philhellenic legion composed of Polish and German volunteers.

Philip II 383/82–336 BC

King of Macedonia

The famous historian Theopompus said of Philip II that "Europe had never produced such a man at all as Philip, the son of Amyntas." Yet the same sentence can also be translated "Europe had never endured such a man at all as Philip, the son of Amyntas." The enigma reflects the mixed views of both Theopompus and other Greeks of the 4th century BC. Moreover, the conundrum persists today. Philip's dubious reputation stems from the hostility shown towards him by many of the ancient writers who treated his life and deeds. His mortal enemy was the eloquent Demosthenes, whose portrait

of him entirely in black has had the greatest impact on the historical imagination from antiquity to the present.

Philip was born in either 383 or 382 BC to Amyntas, king of Macedonia, and Eurydice, a princess of Lyncus. The northern connection proved vastly important to him, for the Illyrians in the northwest, the Paeonians in the north, and the Thracians in the northeast posed continual threats to Macedonia. The Greeks too exploited Macedonian weakness whenever possible. Philip spent three of his early years as a hostage in Thebes during the hegemony. There he learned much from Epaminondas and Pelopidas about Greek life. In 359 BC he returned home, and at the age of 24 ascended the throne.

At the outset Philip defeated the invading Paeonians and Illyrians, and coped with Athens, which supported the pretensions of Argaeus to the throne. This was the first of many Athenian acts of aggression against Philip. Success freed him for intervention in Thessaly at the request of the noble Aleuadae family. This friendly connection served him well by protecting his southern border and later allowing him direct entry into the mainstream of Greek affairs. Hence, by 358 BC Philip had confronted all his enemies by a combination of might and diplomacy.

Philip next built a new, mobile, formidable army, and in 357 BC he used it to conquer Amphipolis, which secured his eastern border and gave him command of the riverine commerce of the Strymon valley. Declaration of war by Athens failed to stop his move into the rich mining region of Mount Pangaeus. In 356 BC he seized Crenides, also rich in gold and silver, the income from which provided him with more than 1,000 talents a year. Now freed from economic worries, in 356 BC he suppressed discontent among the Thracians, Paeonians, and Illyrians, and obstructed Athenian ambitions in the northern Aegean. With his conquest of Pydna, Potidaea, Anthmus, and Methone by 354 BC he gained control of the entire Macedonian coast. Victories in the north and peace in the south gave Philip a secure kingdom, which he further consolidated by winning the complete allegiance of the nobility and moving Macedonians from their mountain fastnesses to newly established cities in the plain. Urban life thereby flourished, and many of these cities survive today in altered form.

Philip entered the main current of Greek affairs by invitation, not by design. In 355 BC Greece had become embroiled in the Sacred War, sparked when the Phocians illegally seized the sanctuary of Apollo at Delphi, whereupon they systematically plundered it. The members of the Amphictyonic Confederacy, which included Thessaly and Thebes, had vainly striven to dislodge the temple robbers. In 354 BC the Phocian general Onomarchus attempted to drive Thessaly from the war by supporting the rebellious tyrants of Pherae. The Thessalians appealed to Philip for help, and he proved so successful that Pherae entreated Onomarchus for relief. After hard fighting, Onomarchus drove Philip from Thessaly, but in the following year Philip defeated Onomarchus at the Battle of the Crocus Plain. Philip added a symbolic meaning to his victory, for he announced that he came to Greece as a champion of Apollo, whose sanctuary he intended to liberate. He came to Greece not as a foreign invader but as the pious defender of Greek religion.

Philip used his victory in Thessaly wisely by bringing it and its federal government completely over to his side. He systematically conquered the strategically vital harbour of Pagasae, next won Pherae, and reduced the rest of Thessaly to his will, the culmination of which was his election as archon of the Thessalian Confederacy. His new position in Thessaly permanently altered the face of Greek politics. He was now the most powerful man in Greece, and no single state could stand against him.

Alarmed by Philip's success in Thessaly, Athens strengthened its position in Thrace. In 352 BC it gained the Chersonese from Cersebleptes. After a campaign in the northwest that took him nearly to the Adriatic, Philip in 351 BC made sweeping gains in Thrace that threatened Athenian designs more closely. In the following spring Philip attacked Olynthus to remove the last major impediment in his political road. In 352 BC Olynthus had made peace with Athens, a breach of its earlier treaty with Philip. In 349 BC Philip declared war, whereupon Olynthus concluded an alliance with Athens. Yet an Athenian relief force proved too small to accomplish anything. Forgoing a direct attack on Olynthus, Philip instead reduced 32 surrounding allied cities, most of them scattered throughout the region. In 348 BC he conquered Torone and Mecyberna, the port of Olynthus, thus closing the trap. Athenian help availed nothing, and in 346 BC Philip took and razed Olynthus. Athens had none the less openly declared war on Philip.

The years 347–346 BC proved fruitful for Philip. At the request of Thessaly and Thebes he marched into Phocis to end the Sacred War. His presence intimidated Athens into making peace. In 346 BC Philip and his allies and Athens with its naval allies concluded the Peace of Philocrates. All other states were excluded. While the negotiations were still pending, Philip defeated Cersebleptes, thus giving him control of the Chersonese. He now stood on the western side of the Hellespont, where he anchored the eastern flank of his empire both militarily and diplomatically.

After the peace Philip campaigned in the north from 344 to 340 BC, during which he subdued the Illyrians as far north as Albania, Epirus, and Thrace, where he established Philippopolis. These expeditions took Macedonian power north of the Great Balkan range. In the northeast he attacked Perinthus and Byzantium in 340 BC, but Athenian and Persian aid foiled his plans. In 339 BC Philip decided that Athens' time had come. Entering central Greece through the Dhema pass, he outflanked Thermopylae and reached Elatea, just three days' march from Attica. Demosthenes rallied first Athens and then Thebes to war. Throughout the year they parried Philip's thrusts, but in 338 BC he reached the small plain of Chaeronea unopposed. The ensuing battle was marked by hard fighting on both sides, but the Macedonians cut through the stubborn front of the Thebans and smashed the Athenians. Even though Philip had not vanquished all of Greece, he was nevertheless *hegemon* (commander) of it.

Military victory was crowned with political consolidation. In 337 BC Philip summoned the Greeks to a congress at Corinth. There he established the so-called League of Corinth that forged a general alliance of Greeks and Macedonians. Each member state received protection from external attack and freedom from outside interference in local affairs. Delegates of the cities met in common assembly to formulate policy, and Philip was elected *hegemon* to implement its resolutions in peace and lead it in war. One of his first acts was to

summon the Greeks to a great crusade against Persia under his leadership. Contingents were assigned and muster ordered for the following spring.

His work in Corinth done, the lord of Greece returned to Macedonia to celebrate his seventh marriage and to prepare for the Persian expedition. His last wedding proved to be his last act. Philip entered the theatre at Aegae at the head of the wedding procession only to be struck down by an assassin. The party who instigated the deed was never discovered. All tracks had been too carefully covered. Alexander, soon to be called the Great, quickly and effortlessly ascended the throne. Philip was buried with great pomp, but his achievements did not die with him.

Philip's legacy reached from his day to this. He inspired the Macedonians to resist Rome, and even Roman victory did not erase his memory. As late as the 19th century his fame remained alive in Macedonian legends, and numerous myths perpetuated the memory of his famous kingdom. Folklore also attributed many of the ruins of antiquity to him. During the Greek War of Independence he served as an inspiration but in a mixed fashion. Although some Greeks compared him to various Turkish leaders, most saw him as a champion against the barbarians. Since World War II the communists and their successors have tried to establish a Slavic state of Macedonia, against which the Greeks have reasonably objected. In the midst of this controversy Philip returned to uphold the Greek cause. In 1978 Greek archaeologists discovered at Vergina a royal tomb that was almost certainly Philip's. Whosesoever it was, it is purely Greek, dating from the late 4th century BC, incontestable proof of Philip's success in cultivating Hellenism in northern Greece. That heritage is as strong today as it was at his death.

Biography

Born in 383 or 382 BC the son of Amyntas and Eurydice, Philip spent three early years as a hostage at Thebes where he learnt much about Greece from Epaminondas and Pelopidas. Returning home in 359 he became king of Macedon at the age of 24. By a series of campaigns he established Macedonian supremacy and at Chaeronea in 338 he defeated an alliance of Athenians and Thebans. He was assassinated at Aegae in 336 BC.

Philip V 238–179 BC

King of Macedonia

The young prince Philip was left fatherless as a boy of 9 in 229 BC upon the death of his father Demetrius II. He was placed in the care of a regent, a royal relative named Antigonus Doson, and was sent to Aratus of Sicyon, a Greek statesman and head of the Achaean League, in order to learn about Greek affairs. The effects of this education on Philip's later behaviour are impossible to calculate. He acceded to the throne in his own right in 221 BC, and quickly became embroiled in the Social War in which he and the Hellenic League faced the Aetolians, Sparta, and their allies. This war (217–200 BC) marked his transition into a mature king.

Philip was a brilliant military commander whose flair got him further than the odds against him should have allowed (although he experienced some spectacular setbacks), but he was reckless and foolhardy. The destruction of the kingdom of Macedonia and the eventual domination of northern Greece by Rome must in large measure be laid at Philip's door. He became alienated from Aratus (and his possible moderating influence) when he fell under the influence of Demetrius of Pharos, an Illyrian dynast whom Rome had placed in control of the Adriatic island of Pharos (Hvar in modern Croatia) and then displaced. Demetrius therefore harboured a deep-seated grievance against Rome, and incited Philip in the same direction. The final break came with Aratus' death in 213 BC, after Philip had seduced Aratus' daughter-in-law. Aratus died, claiming that Philip had poisoned him.

Philip irritated Rome by interfering in Illyria by land and sea, and by staging campaigns in Greece against Roman allies and on behalf of its enemies. Rome's declaration of war on Philip was probably inevitable. Three Macedonian wars against Rome and its allies ensued. Philip's military successes, continued meddling in the affairs of other Greek states, and alliances with various other Hellenistic monarchs increased Rome's suspicions of his political motives and led it to regard him as a dangerous threat. Paradoxically, the Romans claimed to be protectors of Greek freedom against Philip. The appointment of the great Roman general Flamininus to the command in the Second Macedonian War led to Philip's decisive defeat at the Battle of Cynoscephalae (in Thessaly) in 197 BC.

Philip was allowed to remain king, but a fine of 1,000 talents was levied on Macedonia, and his elder son Demetrius was taken to Rome as a hostage. Philip was confined to his kingdom and concentrated on rebuilding his country, with considerable success. He needed to be seen as an active ally of Rome in its further campaigns in Greece while in reality he bridled at his treatment. He continued to pursue an active foreign policy in Thrace, which only fuelled Rome's continued suspicions against him. After Demetrius had returned from Rome, his dubious actions and demeanour led his father to fear him as a Roman-inspired pretender to the throne. Perhaps encouraged by his younger son Perseus (who stood to benefit), Philip had Demetrius killed, thereby clearing the way for the accession of Perseus to the Macedonian throne.

Philip set forth on a great tour of his kingdom, but fell seriously ill in Amphipolis in 179 BC and died soon after. Perseus

inherited a kingdom that was far stronger than it had been at the beginning of Philip's reign. The irony of Philip's reconstruction of Macedonian manpower and its economy lies in the fact that Perseus thought that the country was strong enough to face Rome a third time – this time with fatal results.

It is not easy to assess Philip V's place in the Hellenic world. He is one of the last larger-than-life figures to emerge from the Hellenistic monarchies, but, his dynamic personality aside, this is due to the abundant ancient evidence about his life and career. Given his unique place in history between Greece and Rome, he was an object of fascination to Greek as well as to Roman historians. The flaws in Philip's character are clear and his military genius is undoubted, but hindsight shows that this dangerous combination ultimately opened northern Greece to Roman rule. The final assessment of F.W. Walbank still cannot be bettered:

> But perhaps the greatest irony of all lies in this, that the king of Macedon, who was renowned above all for his energy, speed and enterprise, who opened his reign as the "darling of Greece" ... should claim his place in world history, not for any of these things which he initiated, but solely as the unwitting instrument that enabled the culture of Greece to spread along the paths of the legions to Rome, and so to the western civilisation that grew up after her.

Philo

Jewish philosopher of the 1st century AD

Philo, born in the latter half of the 1st century BC, belonged to a wealthy priestly family in the large Jewish community in Alexandria. Of the course of his life we know nothing save that in AD 39/40, as an old man, he was part of an embassy to Rome to plead the religious rights of the Jews with the emperor Caligula. He was the author of a large number of predominantly philosophical works, many of them taking the form of a commentary on passages from the Pentateuch in the Alexandrian Greek translation known as the Septuagint, in which he sought to reconcile God's revelation to Moses, in which he deeply believed, with the Platonic philosophy of his day (nowadays known as Middle Platonism). Because he believed in the inspired nature of the Septuagint translation, he had no need for recourse to the original Hebrew text, and there is no real evidence of his knowledge of the Hebrew language. His Hellenized Judaism was probably typical of many Greek-speaking Jews of his day, but stands at a distance from the contemporary emerging Rabbinic tradition, in which form Judaism was transmitted to the Middle Ages and beyond to the present day. There are consequently no explicit traces of Philonic influence on subsequent Jewish tradition, and no Jew mentions him by name until Azariah de Rossi in the 16th century. His writings were treasured and preserved by Christians, especially of the Alexandrian tradition.

As with the Stoics in their reconciliation between philosophy and the Homeric epics, Philo's method of reconciliation was allegorical exegesis. His Platonic reading of the divine revelation to Moses in the Pentateuch yields a metaphysical view of God and the cosmos, and of the place of the human within it, that is in many respects typical of the Middle Platonism of his day. His God is one and transcendent and consequently utterly beyond any human comprehension: Philo has a good claim to the title of "the father of negative theology". This one transcendent God is manifest in the universe through his "powers" (*dynameis*), in which his kingly rule and beneficent providence are manifest. The highest of these powers (and sometimes apparently distinct from them) is the Word, or *Logos*, which has some of the characteristics of the Stoic *logos*, some of the Platonic *nous* (or intellect), but is uniquely regarded by Philo (responding to the language of the scriptures) as the utterance of God, as the one who speaks, pre-eminently to Moses. Here, and in other ways, we find in Philo a sense of God's personhood, lacking in his Middle Platonic contemporaries. In his understanding of creation, the account of Genesis is read in the light of Plato's *Timaeus*, and the cosmos, informed by the world-soul, is modelled on the soul–body unity of the human person. In his ethics Philo for the most part follows the Stoics.

Because so much of Philo's work survives, compared with contemporary Middle Platonists, he is an important witness to the philosophical matrix from which Neoplatonism developed, even though his own influence on the Neoplatonists themselves may not be very great. His Platonized Hebraism, however, paved the way for Christian Platonism; it is for his influence on

Christian thinkers that he is important, beginning with Clement of Alexandria and Origen in Alexandria in the 2nd and 3rd centuries AD, and manifest in the 4th century in exegetes such as Didymus the Blind, also an Alexandrian, and the Cappadocian Fathers, especially Gregory of Nyssa. In his *Life of Moses* Philo provided a two-part interpretation of the biblical account of Moses' life: the first part tells the biblical story of Moses, and the second part, through an allegorical account of events from that life, provides an account of how the mind relates to God and the world. Gregory of Nyssa's own *Life of Moses* is clearly inspired by Philo's, and presents Moses' life in the second part as an allegory of the Christian life, understood as the ascent of the soul to God. Through Gregory's version, Philo's *Life of Moses* became one of the models for the *Lives* of the saints, perhaps the most popular form of literature in the Byzantine world. Philo's fundamentally contemplative ideal of the philosophical life had a profound influence on Christian monasticism (already with the Cappadocian Fathers, the "philosophical life" is a synonym for monasticism), and his work *On the Contemplative Life*, in which he gives an account of the life of a Jewish community called the *therapeutae* ("servants" or "worshippers" [of God]), was taken by Eusebius and many after him to be an account of an early Christian monastic community.

Philodemus *c.*110–40 BC

Philosopher and poet

Philodemus of Gadara studied philosophy in Athens, choosing Epicureanism from the several schools there as the doctrine he would follow for the rest of his life. After Athens, and perhaps after a stay in Alexandria, he lived in and around the bay of Naples, where Greeks had settled earlier but whose pleasant surroundings were attracting Romans; many of them were eager to be instructed in the ways of Epicureanism by Siro and Philodemus, both of whom made the acquaintance of Virgil and his circle of friends. Philodemus seems also to have attracted L. Calpurnius Piso Caesoninus, the father-in-law of Julius Caesar, as his patron. When Mount Vesuvius erupted in AD 79, covering Pompeii and nearby towns, the impressive villa on the shore of Herculaneum was found upon excavation in the 18th century to contain the charred papyrus remains of a library comprising, for the most part, Greek Epicurean texts, many by Philodemus. It is usually assumed that Piso was the villa's original owner. Since Philodemus refers in one of his works to his own house as "a humble cottage", he would not have lived in the villa himself, as is sometimes thought.

In addition to the papyrus remains found at Herculaneum, we also have about 35 Greek epigrams written by Philodemus which were preserved in the manuscripts containing the *Greek Anthology*. Although Epicurus discouraged his followers from writing poetry, Lucretius, Philodemus, and some others found ways to justify their poetic activities. What makes Philodemus particularly interesting is that among his prose treatises are several concerned with the composition of poetry and music, which prove to be among the most important theoretical writings on these subjects from Greek antiquity. In his *On Poems* Philodemus argues that poetry is to be judged not by its didactic or instructional value but rather by criteria that are largely but not entirely aesthetic. Poetry, that is, should play with ideas; but if one truly desires to be instructed in the ways of philosophy, there is no substitute for lectures and prose argument. Other writings by Philodemus on literary subjects are *On Music*, *On the Good King According to Homer*, and a *Rhetoric*. In these, as in most of his prose, Philodemus typically reviews and criticizes the various views proposed by others before offering his own views. This methodology is welcome in that it provides information otherwise unknown about obscure theorists of the Hellenistic period. Unfortunately, however, the fragmentary nature of the Herculaneum papyri is often such that isolated sentences, even if largely comprehensible in themselves, cannot be assigned to their proper authors.

Much of Philodemus' writing is ethical in nature. From one large work, *On Vices and Virtues*, and substantial fragments from several other books are extant: *On Flattery* (book 7), *On Household Management* (*Oeconomicus*, book 9), and *On Arrogance* (book 10). Other works preserved to varying degrees are *On Frankness*, *On Anger*, *On Death*, and an untitled ethical work now called, after its first editor, the *Comparetti Ethics*. Philodemus' writings thus nicely complement those of Lucretius, who concentrated almost exclusively in his Epicurean poem on the nature of matter and the causes of natural phenomena, with almost no attention paid to ethical concerns.

Only on the most important subject of death do Philodemus and Lucretius overlap to any appreciable extent, for Epicurus was convinced that only by learning to live without fear of death could mankind achieve and maintain the state of *ataraxia* (lack of disturbance) necessary for happiness. The Epicurean view, denying that there is any life after death or any reincarnation, or that the gods have any concern for our welfare (see Philodemus' *On the Gods*), was used to argue that we should be happy with what little is required to satisfy the basic needs of the body. Philodemus' personal and gentle treatment contrasts noticeably with Lucretius' harsh way of dealing with this subject.

Other ethical works by Philodemus are *On Piety*, *On Frankness*, and *On Anger*. Frankness, or freedom of speech, is not to be taken too literally: Philodemus is here concerned with the appropriate language that one should use in various circumstances, which often calls for caution rather than complete truth. In *On Anger* Philodemus argues, against the Stoic position, that there are indeed times when a display of anger is appropriate.

Philodemus also wrote a work on scientific method, *On Signs*, and some histories of philosophy. It seems, however, that most, if not all, copies of his prose were destroyed in AD 79, although Diogenes Laertius (3rd century AD) may have organized his biographies of Greek philosophers (which end with a lengthy, favourable life of Epicurus) along the lines he found in Philodemus' history of philosophy. Philodemus' poetry, however, which had a much wider audience than his prose, survived on its own to influence contemporary Roman poets (Virgil, Catullus, Horace) and their immediate successors (Ovid, Tibullus, Propertius). Selected epigrams were incorporated by Philip of Thessalonica into his *Garland* of epigrams, which in turn found its way into the *Greek Anthology*, where Philodemus was read and admired from the Renaissance until the present day.

Biography

Born at Gadara in Syria *c.*110 BC, Philodemus studied philosophy in Athens and became a follower of Epicureanism. Moving to Italy, he settled near Naples. Through L. Calpurnius Piso Caesoninus he was acquainted with many students of Greek literature including Horace and Virgil. Some 35 poems of his survive in the *Greek Anthology*. Some of his prose writings survive in charred papyri rescued from Piso's villa in Herculaneum. He died *c.*40 BC.

Philokalia

Anthology of Christian texts

The title "Philokalia" is an ancient one. It means, literally, "love of the beautiful"; beauty being understood, on the basis of the Platonic tradition, as coincident with the Good on the highest level. In Christian usage it was employed by St Basil and St Gregory of Nazianzus as the title of their compilation drawn from the works of Origen. It became a familiar designation of works of compilation in later centuries. The most famous such compilation is that edited and published by St Makarios of Corinth and St Nikodimos of the Holy Mountain: *The Philokalia of the Holy Neptic Fathers* (Venice, 1782).

It is likely that this anthology was based in part on earlier Athonite compilations. This was certainly the view of the Slavonic translator of the *Philokalia*, St Paisy Velichkovsky. No one manuscript or group of manuscripts has, however, been satisfactorily identified as the source. The material was gathered by St Makarios on Mount Athos and presented to Nikodimos in 1777. Nikodimos revised and corrected the text, providing a preface and notes for each of the authors represented. It was Makarios who arranged for its publication in Venice.

The material dates from the 4th to the 15th centuries and provides an excellent summary of the eastern Christian spiritual tradition. The earliest material is from Evagrius of Pontus (*c.*345–99). There are also significant works of (Pseudo-)Macarius (4th century), St Diadochus of Photice (5th century), St Mark the Monk (5th century), St Maximos the Confessor (580–662), St Hesychios of Batos (?8th century), St Peter of Damascus (?12th century), and many texts from the 13th- and 14th-century hesychasts. The anthology covers a great range of writers, virtually all from a monastic background. The selection may have been partly influenced by the availability of texts. The *Apophthegmata Patrum* and the *Ladder* of St John Klimakos, works that would have been available in abundance on Athos, are absent. The selection from (Pseudo-)Macarius is from the less familiar Collection IV of his works. Among the authors selected, St Maximos the Confessor and St Gregory Palamas carry particular weight. There are no texts from western writers, with the one exception of St John Cassian who, in fact, stands very much in the eastern Christian tradition.

The focus of the texts is prayer. They deal primarily with the inner life of the monk. The writings are a school of *nepsis* (vigilance) and *hesychia* (stillness). Later texts put special emphasis on the practice of the Jesus prayer as a means of attaining true prayer of the heart. The writings have as their aim, as the title page puts it, "the purification, illumination, and perfection of the spiritual intellect through moral philosophy on the levels of action and contemplation". The tradition of the *Philokalia* is deeply experiential: theology is never separated from the living experience of God. As Abba Evagrius puts it: "If you are a theologian, you will pray truly. If you pray truly, you are a theologian." This is a sentiment echoed nearly a millennium later by St Gregory Palamas: "Our devotion lies not in words, but in realities." The *Philokalia* has as its aim the achievement of such perfect union between man and God that man may be said to be deified: all else is subordinated to that goal.

Despite the monastic provenance of the texts, the *Philokalia* was aimed at monastics and laypeople alike, as the title page states: "for the common benefit of the Orthodox". They are intended to be read within the context of the living tradition of the Church and under the guidance of a spiritual father. More than that, these texts were published to reanimate and reinvigorate the genuine tradition of the Orthodox Church. Both Makarios and Nikodimos belonged to the movement for liturgical and spiritual renewal known collectively as the Kollyvades. Against the prevailing mentality of the Enlightenment and the spiritual decline of Greece under the Tourkokratia, the Kollyvades looked to a patristic and Byzantine *ressourcement*, to a recovery of the ascetic and mystical tradition of the Church. Even Athos had not been immune to the mindset of the Enlightenment, as witnessed by the establishment of the Athonite Academy under Evgenios Voulgaris (1716–1806). The *Philokalia* represents a kind of response to the dry scholasticism of Enlightenment-influenced theology. It stands as a call to reacquire the experiential, lived theology of the eastern Christian tradition. It provides an alternative to the divorce between theology and mysticism, nature and supernature, time and eternity, implicit within the modern western mentality. It is perhaps for this reason that it has proved so attractive to the contemporary West.

The influence of the *Philokalia* in the Greek-speaking lands was not initially very great. Its early influence was most palpable in Romania and Russia. It was reissued in Greek only in 1893, and not published again for more than 60 years, in 1957–63. The fact that no translations appeared in modern Greek until the 1960s may also have restricted its influence. As St Paisy Velichkovsky observed: "These books are written in the purest Greek tongue, which few among the Greeks understand much of now, except for learned people, and many do not understand it at all; therefore such books have fallen into all but complete oblivion." There are echoes of a response to the call of the *Philokalia* in writers such as Alexandros Papadiamantis, but it is only in the latter half of the 20th century that the kind of *ressourcement* urged by and typified in the *Philokalia* has begun to take hold in Greece. Much of the stimulus to this response has come from outside, most notably from the "Paris school" of the Russian Orthodox diaspora. Figures such as Demetrios Koutroublis have acted as catalysts in this process. It is a renaissance that is now firmly rooted in Greek soil. The monastic revival of modern Greece, in particular, owes a great debt to the "mystical school of noetic prayer" that is the *Philokalia*.

Summary

In Christian usage the term *Philokalia* was applied to compilations of spiritual writings. Most famously it is applied to the compilation made by St Makarios of Corinth and St Nikodimos of the Holy Mountain and published in 1782 with the title *The Philokalia of the Holy Neptic Fathers*. It incorporates a wide range of mystical writings from the 4th to the 15th centuries which form a summary of the Eastern Christian spiritual tradition.

Philopoemen *c.*252–182 BC

Achaean statesman

Philopoemen, son of Craugis of Megalopolis in the Peloponnese, grew up against the background of the political activities of the Achaean League (a federation of Greek cities in the Peloponnese) under its most famous leader Aratus of Sicyon. He became the pupil of Demophanes and Ecdelus, the liberators of Megalopolis from the tyrant who ruled the city in the mid-3rd century BC. Since Demophanes and Ecdelus had been pupils of the famous philosopher Arcesilaus of Pitane, head of the Academy in Athens, theories have been put forward about their philosophical influence upon the young Philopoemen. It can at least be said that they were staunch opponents of tyrannical government wherever they found it, and Philopoemen's predilection for federal government stayed with him throughout his life.

Philopoemen espoused the policies of the Achaean League, especially its strong anti-Spartan bias. He fought with the league against Sparta at the Battle of Sellasia in 221 BC, playing a prominent role that was lavishly praised by the historian Polybius (see below), and spent the next 11 years in Crete apparently furthering Macedonian interests there. His return to the Peloponnese coincided with the power vacuum in league politics left by the death of Aratus in 213 BC. He began holding league offices in 210 BC, and was elected its general for the first time in 208 BC.

Philopoemen finally helped to defeat the Spartan usurper Nabis, and forcibly united Sparta to the Achaean League in 192 BC, and he fought for its continued membership despite attempts to detach it by rival factions supported by Rome. His harsh treatment of Sparta alienated even some Achaean supporters and led to Spartan complaints in the Roman Senate. Philopoemen fell out of favour with Rome when he and his supporters maintained that various suggested solutions to Peloponnesian problems were none of Rome's concern but internal league affairs. He furthered his beliefs through league policies in the face of growing Roman involvement in the Peloponnese, although his intransigence caused a rift in the league. The political situation was unresolved when Philopoemen was captured in battle in Messenia in 183/82 BC and he died in prison, perhaps poisoned by his captors; poison was, of course, alleged by his political heirs.

Before his dramatic public funeral, Philopoemen's ashes were borne in an emotional procession back to Megalopolis by the young Polybius (later the historian), whose father Lycortas

had been a friend and close political ally of Philopoemen (Lycortas succeeded Philopoemen as general of the league and continued to carry out his policies vigorously). In his later *Histories* Polybius, understandably profoundly affected by these earlier events, depicted Philopoemen as a great folk hero of the Achaean League and a great Greek patriot standing firm against the threat of Rome. Because the writings of Polybius are our best historical source for this period, his picture of Philopoemen has coloured later appreciation of him. Most modern scholarship would now argue that Philopoemen's vision was parochial and his policies blinkered by his opposition to Sparta and Rome. With the benefit of hindsight it is clear that the Achaean League could not in the end resist the power of Rome, and Philopoemen's activities led to greater Roman interference in Greek affairs and to the ultimate defeat of the Achaean League in 146 BC.

In his *Life of Philopoemen* Plutarch (1. 4) says that a certain Roman called Philopoemen "the last of the Greeks". Plutarch himself interprets this to mean that "Greece produced no great man after him, nor one worthy of her" (Loeb translation), but this is clearly a banal observation that is manifestly untrue. The explanation of this enigmatic statement has been widely debated by modern scholars. The most plausible interpretation is that Philopoemen was the last Greek in this turbulent age to achieve local political independence – albeit temporary – for his state. In this case it was the Greek Achaean League against the dominant power of Rome. Like Aratus before him, who had achieved similar freedoms, and because no later Greek was to have equal success in this regard, Philopoemen was thus worthy of extravagant praise and the accolade "the last of the Greeks" (see Errington, 1969, pp.216–27).

E.E. RICE

Biography

Born *c.*252 BC the son of Craugis of Megalopolis, Philopoemen was a pupil of Demophanes and Ecdelus. He fought for the Achaean League against Sparta at the Battle of Sellasia (221 BC) and then served 11 years in Crete. Returning to the Peloponnese on the death of Aratus, he became general of the league in 208. In 192 he brought Sparta into the league but lost favour with Rome. Captured by Messenians, he died in prison in 182 BC.

Philoponus, John

Philosopher of the 6th century AD

John Philoponus was born in Caesarea around 490 and died in Alexandria after 567, perhaps even after 574. The biographical information about him is extremely scanty. The name "Philoponus" is a nickname, presumably given to him either because he was a "lover of work" or because he belonged to the Alexandrian guild of *philoponoi* or church helpers. He was also called "Grammarian", a title that is usually taken to imply that he never succeeded in obtaining the chair of philosophy. He seems to have been a Christian by birth. He was a student of Ammonius, who was a son of Hermeias and head of the Alexandrian Neoplatonist school.

Philoponus' activities extend into several fields, but his chief claim to fame is his massive attack on the Aristotelian science of the time, in particular Aristotle's assumption of the eternity of the world. He wrote at least three treatises for this purpose. The first, *De Aeternitate Mundi contra Proclum*, was written in or shortly after 529 and is thought to have been intended as a demonstration to the authorities that it was unnecessary to extend their measures against the Neoplatonists of Athens to Alexandria because the Neoplatonists there had reached an understanding with the Christians. Most of the surviving fragments of the second work, *De Aeternitate Mundi contra Aristotelem*, are preserved by Simplicius, but some more fragments have also been found in Arabic and Syriac sources. In *De Opificio Mundi* Philoponus argues that there is no inconsistency between the cosmogony of the Bible and science.

In all these treatises Philoponus' arguments are primarily based on a central contention, which springs from the Christian conception of creation, namely that the universe had a beginning. The object of his attack was the dominant Aristotelian view that postulated the eternity of the universe and the dichotomy of heaven and earth, according to which the celestial region has an invariable structure whereas things in the sublunar region may be contingent. Philoponus refuted Aristotle's doctrine that the celestial bodies are made of indestructible aether – i.e. the fifth element whose natural movement is circular – by referring to astronomical observations that prove that the stars have specific motions not homocentric with the universe. In fact, he argued that the sun and the stars must be composed of fire, and that the different colours indicate differences in material composition. Thus, he inferred that the heavenly bodies are not distinct from the terrestrial ones, and hence are not eternal. Philoponus moreover argued, against the Aristotelian and Neoplatonic belief in the eternity of the world, that the universe, like every organic entity, is composed of parts that actually change at different rates, which may be extremely low.

In addition, Philoponus criticized Aristotle's explanations of dynamics, and proposed his own innovative theories on velocity in a void and on impetus. He believed, unlike Aristotle, that void is possible and that velocity in a void need not be infinite. Of great importance also is his doctrine of the impetus, in which he developed earlier ideas of Hipparchus and Ptolemy and rejected the Aristotelian conception that a body can perform a motion other than its natural one only as long as a force acts on it; it was supposed, for example, that a projectile is kept moving by the constant push of the air behind it. Philoponus, on the other hand, advocated that an immaterial kinetic power is imparted by the thrower to the object thrown and keeps the projectile moving until the power is consumed. Later, Philoponus expanded impetus theory into a unifying system by claiming that God impressed different kinds of impetus into bodies at the time of the Creation. Philoponus'

theory of light is also related to his concept of the impetus, in that he regards light as an impetus emitted from the luminous body and propagated to the eye according to the laws of geometrical optics. This conception is opposed to that of Aristotle, who regarded light as the actualization of a potential state of a transparent medium, thus in no way associating it with motion.

Though not all of these ideas were entirely new, they were argued by Philoponus with great detail and thoroughness, and were often to prove more influential in Philoponus' version than in those of his predecessors. In particular, Philoponus' theory of the impetus was very influential, even if his eventual influence was delayed by theological controversy. For since he was anathematized in 600 for his views on Christology, his theories were marginalized and first taken up by Islamic philosophers in the 12th century. They became known in the Latin west only in the 13th century, some by direct translation, but most as filtered through Arabic sources, so that they were not attributed to him, with the result that modern scholars have believed them to be discoveries of the philosophers of the 13th century. He finally came fully into his own with the extensive Latin translations of the Renaissance, so that he came to be acknowledged by such thinkers as Galileo, and his ideas contributed to the breakaway from Aristotelian science.

Similar views are expressed in Philoponus' commentaries on Aristotle's physical works, namely in his commentary on the *Physica*, the *De Generatione et Corruptione*, and the *Meteorologica*. In addition, Philoponus composed commentaries on Aristotle's logical works, the *Categoriae* and the *Analytica Priora et Posteriora*. Simplicius accuses him of not being competent in logic, and modern logicians may agree. However, it is still the case that Philoponus' logical commentaries often record interesting views that are not preserved by his predecessors, and which proved to be quite influential to the Byzantine logical tradition. Finally, we also have Philoponus' commentary on Aristotle's *De Anima*, part of which was translated into Latin in 1268 by William of Moerbeke. There is no doubt that all these commentaries constitute, to a large extent, Philoponus' revised version of the notes taken at Ammonius' lectures. However, careful comparison with the commentaries attributed to Ammonius himself suggests that Philoponus was an independent thinker, who at times even points out that he is dissenting from his teacher's doctrines.

In the later part of his life Philoponus turned to controversial issues of Christian doctrine. Several theological treatises have been attributed to him, but the evidence for his authorship in some cases does not seem to amount to proof. Most of these works are transmitted in Syriac. According to the notice of him in the *Suda*, he was declared by the doctors of the Church to have fallen into the heresy of Monophysitism and Tritheism. Several of his early theological works, including the *Arbiter* or *Diaetetes* and the *Letter to Justinian*, prove that he was a supporter of the monophysite view that Christ had only one nature, not two, one human and one divine. A treatise entitled *On the Trinity* or *On Theology*, which was written in 567, and a later one *Against Themistius*, reveal his tritheistic doctrines, according to which the Trinity should be viewed as three substances.

Philoponus' other works include the oldest extant account in Greek of the plane astrolabe and a commentary on Nicomachus' *Introduction to Arithmetic*, which was a standard text used in the quadrivium. Grammatical treatises on accentuation are also ascribed to him (*De Vocabulis Quae Diversum Significatum Exhibent Secundum Differentiam Accentus* and *Tonika Parangelmata Ailiou Herodianou peri Schematon* [Accentual Rules of Aelius Herodianus on Logic]); probably none of these works has come down to us in its original form, because their utility invited alterations and abridgements by other teachers. Finally, some manuscripts attribute to him writings on medicine, but that is most probably a mistake, though an influential one, for it seems to have earned him a great reputation as a physician among Arabic authors.

KATERINA IERODIAKONOU

Biography

Born in Caesarea *c.*AD 490, Philoponus was apparently a Christian and a pupil of Ammonius, head of the Neoplatonist school in Alexandria. He became a teacher in Alexandria. As a philosopher he attacked Aristotle on the eternity of the world. As a theologian he supported the Monophysite view of creation. He died probably in the 570s.

Philosophy

Ancient Greeks were the first to practise philosophy – that is, they did not just provide world views or narratives, but argu-

ments and reasons. Greeks were highly competitive and fond of adversarial, critical debate. To do this effectively, the philosophers abstracted and analysed, which led them to distinguish specialized areas of inquiry or method. They considered nothing exempt from scrutiny. Philosophy was universal in scope, inclusive of politics, physics, astronomy, cosmology, mathematics, ethics, psychology, religion, and literature. On the whole, epistemology (how and what we know) was closely connected with metaphysics (what are the nature and causes of things), while ethics (literally habits and conduct) was an extension of psychology (theory about life).

The philosophers were small groups of dedicated individuals, usually conscious of their difference from ordinary citizens. The Pythagoreans first organized a philosophical society, which distinguished between occasional followers and more permanent members, and had its own rules of conduct. Plato established his Academy (387 BC) with the benefit of the Pythagorean example, and made it an autonomous fellowship for advanced universal study. In the Roman empire philosophy schools were centres of higher learning, passing this heritage to Europe and Islam. Thus, the Greek philosophical methods and practices became international and intrinsic to university education.

Greek philosophy is summarized here in the following periods: early philosophers (Presocratics, Sophists, and Socrates); Plato and Aristotle; the schools (Sceptics, Epicureans, Stoics, Lyceum, Academy); break, new trends, and state recognition (Middle Platonists, Aristotelians, Sceptics, Neopythagoreans, Plotinus); Neoplatonists and the end of the independent schools; Byzantines; and post-Byzantine and modern Greek philosophers.

Early Philosophers

The first philosophers (6th–5th century BC) abstracted for the purpose of understanding, provided varied accounts of their ideas, and tested their conclusions and common sense by taking them to logical extremes (e.g. paradox-making). They were disparate individuals or small circles of friends known by their home town or leader. Their generic labels, however, serve an ulterior bias. Aristotle called them "physicists", because he wanted to show that they were limited to studying only one of his four causes, the material. Moderns call them "Presocratics". Yet, all were interested in ethics, too, and several were Socrates' contemporaries. Moreover, Socrates' reputation as a philosopher is owed completely to Plato's genius for philosophical writing and foresight in establishing a self-perpetuating school.

Greek philosophy until Plato is very fragmentary and doxographical. Some (e.g. Socrates, Pythagoras) preferred not to write, and the rest left records that did not survive intact. Our two main sources are Aristotle and the Neoplatonist Simplicius.

The Milesians (flourished 6th century BC) proposed parsimony. The world as one experiences it is due to one principle (*arche*) taking many shapes and forms. For Thales this principle was multiphase water, for Anaximander infinitude, and for Anaximenes diffuse air. The Pythagoreans (6th–4th century BC) asserted that pure numbers are the permanent principles of physical things. They also arrived at the peculiar doctrine of the transmigration of psyche, not just from religious belief but from logical conclusion: the principle of life, psyche, cannot not-live.

Heraclitus (late 6th century), the "riddler", alluded to the interrelatedness of things and their constant change by employing paradoxical ("everything is and is not") or obscure ("everything flows") sayings. Fire exemplifies the variety and contradictions of things. Philosophers, therefore, have to pay closer attention to reason and account (*logos*). On the other hand, the Eleatic Parmenides (early 5th century BC) made the startling claim that certainty in word, thought, or existence can only apply to something positive, unitary, and unchanging. Zeno followed this by showing the paradoxes entailed by change and plurality in ordinary events.

The Athenian Anaxagoras (5th century) responded to Parmenides with the theory that the world is a mixture of all substances, and change is just the rearrangement of stuffs. *Nous* (intellect), the stirrer of the mixture, alone is incomposite. Empedocles (influenced by Pythagoreans) was the first to invent the notion of fundamental cosmic constituents, the elements. He suggested four: Fire, Air, Water, and Earth. Democritus theorized that all things, including souls, are really temporary regroupings of an infinite number of tiny, invisible "indivisibles" (*atoma*). Thus what truly is and what appears are different.

Socrates (5th century BC) also upheld that there are invariable principles of things but sought them through the "right reason". Ordinary conversations on ethics and knowledge are soon transformed into probing tests how to define things (virtue, etc.), so they are valid for all possible occasions. For his purpose Socrates employed extensively counter-argumentation. This was typically practised by the Sophists (lit. "the clever ones"), mainly for the purpose of winning lawsuits for their paying clients. Prominent sophists, however, such as Protagoras and Gorgias, were philosophically interested in the problems of communicable account (*logos*), ethics, and the origins of human judgement.

Plato and Aristotle

Plato and Aristotle (5th–4th century BC) consolidated earlier thought (Parmenides, Heraclitus, Anaxagoras, Empedocles, Socrates), and originated an unprecedented advance in conception and expression. They were responsible for a basic division in philosophy.

Plato was Socrates' most eloquent follower. What survives are his public treatises, the dialogues, which were written as Socratic debates on key philosophical problems. Plato was also influenced by the Pythagoreans, when he was involved with power-politics at a Greek colony in Sicily. The later Plato shifted his attention, but towards what: logic, politics, or Pythagorean-type metaphysics? Plato remains controversial, for every party wants to claim the first major philosopher as their own.

Aristotle was a student at the Academy for 20 years until Plato's death. After empirical studies on the natural world, he returned to Athens to start his own philosophy and school, the Lyceum, or Peripatos. Aristotle's philosophy bears some similarities with Plato's, but in other respects it contradicts it, and in the fundamentals it is different in scope. Unlike Plato, what

survives are his internal school lectures (see below on the Lyceum and on Andronicus).

For Plato, truth is found in reality, which to be unfailingly valid has to be separate from the changeable world around us. Reasoning and mathematics point the way to full, precise knowledge (*episteme*) of the "true realities", the "Forms". One of these, the Good, is ultimate. Physical things, properties, and sensations are merely the "appearances" (*phainomena*) of the Forms.

For Aristotle, reality lies in nature. The "forms" are merely the essential definitions of things. Change can be philosophically known because it involves the "actualization" of the "potential" to gain the thing's proper definition (e.g. for an oak seed to become an oak tree). However, a thing may be logically stripped, abstracted, of its various physical and mathematical properties until the philosopher examines only its essential substance, and ultimately the pure being (*on*).

The elements of the physical world for Plato are minimal shape-quantities, since mathematical properties underlie physical qualities. But for Aristotle, they are minimal qualities (hot, dry, moist, cold), because the constituents of sense-perceived things must be sensations.

In logic, Plato developed the "dialectical" analysis, but Aristotle constructed the formal "syllogism" and critically distinguished the terms of scientific knowledge. In ethics, Plato boldly prescribed the ideal virtues of both individual and society, but Aristotle analytically described the problems of choice, constantly relying on the opinion of the moderate majority.

The Schools

The period from the 4th to the 1st century BC saw the establishment of philosophical schools at Athens, their proliferation, and greatest rivalry. Unfortunately, of their thousands of books, few survive complete, and scholars must rely on collections of fragments and reports.

The first new talent was Pyrrho (360–270 BC). He pointed out that neither reason nor sense-perception can form knowledge, leaving the suspension of all judgements. Psychologically and ethically it offers "well-being" as relief from all theories. This "sceptical" approach did not survive as an independent school, but was adopted by the Academics.

Epicurus established the main branch of his school at Athens in 306 BC. He followed Democritus' atomism, but went far further. Philosophy is practical wisdom gained empirically. Ethics shows that the natural impulse of living beings is to gain pleasure and avoid pain. Happiness is the autonomous pursuit and holding of enduring pleasure. This is found in philosophy, companionship, and modest delights. Knowledge is attained with the veridicality of sense perception, assisted by natural conceptions. Such is the "yardstick" (*kanon*) and "discerning mean" (*kriterion*) of truth.

The highly acclaimed Stoic school was founded in 300 BC by the Cypriot Zeno. He was succeeded by Cleanthes, and Chryssipus (head, 232–206 BC). They subdivided philosophy into logic, physics, and ethics, after the Old Academician Xenocrates. For Stoics, philosophy is practical, based on the world as it is. The natural world is analysed into one continuous body causally joined by a universal *pneuma* and organized by reason-principle (*logos*), which can be worshipped as divinity. Ethics shows how to lead a life according to nature, guided by reason. The "psychotherapeutic" benefit is "apathy", freedom from troublesome passions, which brings the "well-being" of happiness. Physics and logic show how natural things are constituted, and become known through the presentation (*phantasia*) on the physical senses. Stoics developed sophisticated distinctions about substance, knowledge, and logic, and their terminology influenced subsequent philosophy.

Of the older schools, Aristotle's Lyceum fell into decline. His successor Theophrastus continued the interest in natural science and philosophy. Yet, it seems that its philosophical naturalism and rationalism were better explored by Epicureanism and Stoicism, while science was better served at the new science school, the Museum of Alexandria. Strato rejected a good deal of Aristotle's physics.

Plato's Academy underwent the greatest transformation. His immediate successors (Speusippus, Xenocrates) elevated mathematics and considered the Forms as mathematical objects. But Arcesilaus (Middle Academy) abandoned systematic philosophy, and returned decidedly to the Socratic critical questioning, using it to attack Stoicism. With Carneades (New Academy), the Platonic school became the champion of scepticism, extending and formalizing it. Carneades' refutation of Stoicism proved lasting.

Break, New Trends, and State Recognition

The first break happened in 86 BC, when the Roman consul Sulla sacked Athens. Institutions, including the Academy and the Lyceum, were destroyed. Philosophy diffused outside Athens and Greece, and freelancers advanced new trends. New schools often claimed succession from the original.

The Platonist Antiochus of Ascalon (1st century BC) reacted against the sceptical Academy. Instead he endorsed the positive value of Socratic thought, and showed that Aristotle and the Stoics developed particular views of Plato. Eventually this dealt the final blow to independent Stoicism: from now on there emerged Stoic Platonizers, such as Posidonius, the proponent of "universal sympathy". Nevertheless, Stoicism flourished among Romans, from Seneca and Epictetus (1st century AD) to Emperor Marcus Aurelius (2nd century AD).

Plutarch of Chaeronea (AD 45–125), head of a Platonic school at Athens, promulgated the dualism of good and evil cosmic agents. He and the Neopythagorean Numenius proved the most influential of this period's Platonizers; their doctrines entered Gnosticism, and similar Near Eastern religions. Moreover, in the 2nd-century *Handbook of Platonism* by one Alcinous, the Aristotelian forms were incorporated as the objects of sense perception. Alexandrian Platonists included the Jewish theologian Philo (who originated the Bible's agreement with Plato), and the famous physician Galen. The 2nd- and 3rd-century AD Alexandrians St Clement and Origen pioneered Christian philosophy while arguing continuity with Platonism.

Around 60 BC Andronicus of Rhodes recovered Aristotle's lectures, and edited them in the systematic form known to this day. He also started writing commentaries, amending and criticizing the doctrines as he saw fit. The Aristotelian Aristocles (2nd century AD) advocated Plato's agreement with Aristotle,

so long as the latter remained the fulfilment of the former. He taught Alexander of Aphrodisias.

Scepticism found a new exponent in Sextus Empiricus (*c.*AD 200). He showed that every philosophical position has equally strong but opposite arguments, which leads to the suspension of judgement (later employed in negative theology).

Hadrian and the Antonine Roman emperors inaugurated a series of state recognitions of Athenian learning. In AD 176 the emperor Marcus Aurelius established four Athenian professorships ("successors") in Platonism, Aristotelianism, Stoicism, and Epicureanism. They were the highest-paid teachers in the empire, attracting 50 per cent more salary than the equivalent rhetoricians. However, the 3rd-century Roman civil wars starved imperial funding. Of the independent successors only the Platonists endured.

The Platonic professor was probably Atticus. He maintained dualism, and was fiercely anti-Aristotelian. The Aristotelian professor of about AD 198/209 was Alexander of Aphrodisias. He was the great systematizer of Aristotelianism, and the proponent of influential interpretations. Particularly, he identified the object of thinking with the thinking activity and intellect. This strongly attracted Platonists, such as Plotinus, who made the Forms both objects and contents of intellect.

Individual Neopythagoreans especially flourished in the 2nd century AD. For them, the pure Plato was Pythagorean. Nicomachus, author of the *Introduction to Arithmetic* (later a textbook), held unity to be the ultimate principle of the Forms as numbers. Numenius of Apamea differentiated God the creator from God supreme, and asserted that matter is both active and evil. An allied Neopythagorean was possibly Ammonius Saccas, the Alexandrian teacher of Plotinus and the Christian Origen.

Plotinus (3rd century) settled in Rome, where he attracted a wide circle of followers, including senators. He saw reality as a continuum emanating from a transcendent One, made identical to Plato's Good. It becomes differentiated into Intellect and Soul, as degrees of being. Matter is informed by them but itself is a privation, the source of evil. For Plotinus, Plato was the philosopher who came closest to this truth. Plotinus entrusted his student Porphyry to edit and publicize his works. Porphyry had already left because he disliked Plotinus' diminishing of Aristotle.

Neoplatonists and the End of the Schools

After his departure from Plotinus (AD 268), Porphyry elevated Aristotelian studies and assimilated Stoic ethics and logic, all within a revised Platonism. Iamblichus (4th century) increased dramatically the popularity of this "harmonization", and added Neopythagorean ideas: mathematics is the reliable basis of knowledge, embracing theology. With this merger of most of Greek sectarian thinking (Epicureanism alone was rejected) into a new, unified Hellenic philosophy came the domination of higher education of the Mediterranean world.

Single schools of philosophy appeared at Apamea, Pergamum, and at the chief place of learning, Athens, where the new school called itself the "Academy" (Plutarch of Athens, Syrianus, Proclus). From Athens, philosophy schools spread to Alexandria (Hierocles, Hermeias, Ammonius), and through Alexandria even to a Christian Platonic school at Gaza.

The philosophers of the 4th to 6th centuries AD bear the modern, inadequate label "Neoplatonists". They rejected dualism, whether Gnostic, Christian, or Platonic/Pythagorean. They proposed that knowledge, reality, matter, religion, and ethics are multimodal, founded on One unqualified principle. Aristotelian logic and metaphysics are valid for the modes relating to sense perception, and to things referenced to or abstracted from body and senses. Platonism is valid for the modes fixed by intellect, for the incorporeal, permanent realities, and the One.

The Neoplatonic schools were centres for research and teaching. Accordingly, they offered an encyclopaedic education. It encompassed science (physics, mathematics, astronomy, medicine), the study of literature, interpretation (exegesis), and politics.

However, in AD 529 came the second break in the history of Greek philosophy. Emperor Justinian banned public teaching by pagans. This and the increased enforcement of state-regulated teaching ended the millennium of independent schools of philosophy.

The Athenian school closed, and after an unsuccessful trip to the Persian court, its scholars dispersed. However, Simplicius flourished after the ban as a private writer. Continuity in private would account for the story that the 7th-century Greek monk, Theodorus, who became archbishop of Canterbury, studied philosophy at Athens.

The Alexandrian school survived the ban by compromising with local authority. One of its later members, Stephanus, occupied the prestigious, sole philosophy professorship at the Imperial Academy of Constantinople (610).

Byzantines

Byzantine philosophy from the 6th to 9th century was largely a continuation of the late antique but applied to the rational grounding of Christian doctrines, such as God's transcendence and immanence, and the coexistence of divine and human natures in Christ. Due to the Neoplatonic transmission, both Aristotle and Plato were taught at the Imperial and Patriarchal Academies. Maximos the Confessor (a saint in the Greek and Latin churches) clarified the Orthodox tenets, particularly the relation of God to being and generation. John of Damascus elucidated the function of divine representations in the controversy against iconoclasm.

The value of Hellenic philosophy having been demonstrated, 9th- to 12th-century Byzantines turned increasingly to the ancients. Patriarch Photios and bishop Nicholas of Methone championed Aristotle, while the university professor Michael Psellos promulgated Plato, Plotinus, and Proclus. The autonomy of philosophy was enhanced.

Despite the territorial decline of 13th- to 15th-century Byzantium, philosophical study increased. The reorganizer of education, Nikephoros Blemmydes, returned to the Neoplatonic programme of harmonizing Aristotle with Plato, which was further cultivated by his student the emperor Theodore Laskaris, and by George Pachymeres. Nikephoros Choumnos fostered an Aristotelian mainstream in the university and the Church. Theodore Metochites, however, employed

scepticism against both religionists and rationalizers, and pointed to the limits of knowledge. George Gemistos Plethon rejected all religious dogmatism and saw philosophy (Neoplatonism) as the sole guarantor of truth. With his visits to Medici Italy he inspired the founding of the Florentine Academy. His student Bessarion later settled in Italy, where he became cardinal and envoy to European courts, promoting Platonic and Aristotelian studies.

Outside the Greek world, Islamic thought grew after its direct contact with Greek philosophy at Alexandria. Jewish thinkers profited from Greek philosophy first in 1st-century cosmopolitan Alexandria (Philo) but mainly during the Islamic period. Western European philosophy was born through Latin Neoplatonism (including Boethius) and Augustine. Aristotelianism flourished in the 13th–16th centuries. The 17th-century "mechanical philosophers" and empiricists rejected both Aristotle and Platonists, and instead took for a model the neglected Greek atomism of Democritus and Epicurus. Eventually this led to the separation of science from philosophy. From the 18th century onwards, Aristotelianism and Platonism influenced idealist philosophers (Hegel, Kant, *et al.*), while 19th- and 20th-century phenomenologists and existentialists often build on or react against the Hellenic-based views of intellection, being, and existence.

Post-Byzantine and Modern

The Turkish conquest of Greece and Constantinople (1453) was followed by a dark age. Intellectuals, such as Bessarion, John Argyropoulos, Dimitrios Chalkokondylis, and the Laskaris brothers, emigrated to Italian universities. At home, encouraged by special Ottoman privileges, education survived under the auspices of the Church at the Patriarchal Academy, schools in the Aegean and Ionian islands, Ioannina, and Asia Minor.

The revival of Greek higher learning formally starts with the return from Padua of an Athenian émigré, Theophilos Corydalleus. He had been in Galileo's circle, and studied Aristotle and the commentators. Corydalleus taught at Athens *c.*1610–20, then in the Ionian islands, and finally became head of the Patriarchal Academy. He exerted a lasting influence on the philosophy (logic and neo-Aristotelianism), education, and language of post-Byzantine Greece, but also precipitated the tensions over its identity: secular or religious; Classical, contemporary, or traditional; homegrown or imported?

From 1670s to 1770s, Mavrokordatos and other members of the Phanariot community (the administrative class at Constantinople) introduced more western European influence with their liberal education. Some adhered to rationalism and neo-Aristotelianism (from Padua), others advocated John Locke's empiricism, which broke ties with ancient tradition. The Ionian Evgenios Voulgaris, head of the shortlived Academy on Mount Athos (1750s), unusually combined avant-garde empiricism with Classical Greek expression.

The period leading to Greek independence (1820s) brought a deepening in professional philosophy and a confidence to debate home-grown material, influenced by Locke and Kant. Josephos Moisiodax rejected all scholasticism and authority (particularly Corydalleus), and defined "sound philosophy" to be practical. Athanasios Psalidas courageously arrived at the philosophical impossibility of knowledge, which leaves ineffable revelation. Benjamin Lesvios promulgated the unity of empiricism with mathematics, and the human self-licence for free action. Adamantios Korais rejected the Byzantines and scholastics as grammarians void of philosophy. He promoted emancipation through rational education and the study of Classics. Daniel Philippidis expounded language philosophy, where philosophical meaning derives from word usage, and argued for the "analytic" against the "synthetic". He also put philosophy at the basis of education. Nikephoros Doukas, however, pointed to the coherence of ancient Greek, and urged the teaching of philosophy in that language. Konstantinos Koumas went further in favour of experimental science, against didactic philosophy.

The first decades of modern, independent Greece (1830s to 1870s) saw the great philosophical activity of the Ionian Academy, and the establishment of the Athens University (1837-) where the Ionian Neophytos Bambas was the first philosophy professor. The Ionian Academy used French rationalism and Scottish psychology for a new philosophy of self-consciousness. Peter Braïlas-Armenis (Ionian Academy, 1824–64) introduced a conciliation of idealism with realism, and Spyridon Komnos (later director of the National Library 1870–75) advanced the philosophy of Victor Cousin, including his Neoplatonism. Nineteenth-century Greek thought also bore the influence of Hegel. Several considered German idealism (e.g. problems of One and Many, being and existence) as the return of philosophy to its Greek roots. Supporters of idealism included Paul Kalligas and Philipp Ioannou.

In the 20th century positivism was promoted by Theophilos Voreas (philosophy chair at Athens), who was also an influential sponsor of philosophy in education. Neo-Kantianism and Platonism were championed by Charalambos Gieros, Ioannis Theodorakopoulos, and Konstantinos Tsatsos. The election of Tsatsos as the first constitutional president (1975–80) of the new Greek Republic honoured the free-loving engagement with intellectual argument for itself and for the benefit of individual and civic life, which has characterized Greek philosophy since the beginning.

Phoenicians

"Phoenicians" is a term used first in Classical sources to describe the people occupying the cities of the Levant coast between Syria and Israel. It was a term developed by the Greeks and its origins may be a Greek form of "Canaan" or, as is more usually assumed, it derived from the word for purple dye with which Phoenicians were associated. Linear B tablets contains a word *po-ni-ka* which probably referred to this dye.

The Phoenicians were inextricably linked to the sea; their cities were those independent Canaanite states which had not been absorbed by the Aramean or Israelite expansion. Among the Phoenician cities were Arvad, Beirut, Byblos, Sidon, Tyre, and Tarsus. The names of the coastal cities became synonymous with the Phoenicians; so in the *Odyssey* Eumaeus describes the Phoenician sailors who took him captive as Sidonian, from the city of Sidon (Homer, *Odyssey*, 4. 84). Phoenician also describes the descendants of colonial populations which the people of the Levant established elsewhere in the Mediterranean. Among their better-known colonies are Citium (in Cyprus: see Michaelidou-Nicolaou, 1987) and Carthage.

The Phoenicians are best known in ancient Greek literature for their commercial enterprise which paved the way for their foundation of new settlements, the majority of which were located in the western half of the Mediterranean (Frankenstein, 1979). The major colonization phase predated the emergence of Greek colonies; Thucydides (6. 2. 6) realized that Phoenician settlements in Sicily predated Greek activities on the island.

The Phoenicians transmitted much of their own culture and that of others from the Near East to Greece with the diffusion of their settlements and their highly developed trading activities. However, the Greek image of the Phoencians has done much to limit the popular image of their culture: rich in religion, craftsmanship, and writing. It is easy to forget that the Greek figure Heracles is in fact a reincarnation of the Phoenician god Melaurt. The poor survival of Phoenician writing makes it difficult to trace other influences. Few literary texts have survived, and the majority are brief religious dedications, honorific cult decrees, or funerary monuments inscribed on stone. The Phoenicians were also famous for their glassware (Pliny, *Naturalis Historia*, 36. 65) and their metalwork – they are said to have discovered the silver mines of Cadiz in southern Spain (Diodorus Siculus, 5. 20).

The spread of the Phoenicians westwards throughout the Mediterranean diffused an important orientalizing influence. The Phoenicians had absorbed many cultural aspects of the Assyrian and Mesopotamian civilizations, and so their influence on Greek civilization was not restricted to the transmission of their own culture. Communities on Cyprus display considerable absorption of Phoenician culture. The building styles, metalwork, and ivory objects indicate the degree of Phoenician presence; even the designs and decoration on indigenous pottery imitate Phoenician ware. Citium, in northeast Cyprus, and its inhabitants were described as Phoenician up to historical times; their most famous citizen was Zeno the Stoic philosopher.

Probably the most important legacy of the Phoenicians was the adoption of their alphabet by the ancient Greeks. The Greek alphabet developed out of the Semitic alphabet perhaps as late as the 8th or early 7th century BC. Herodotus had first suggested that the Greeks learnt their alphabet from the Phoenicians (Herodotus, 5. 58. 1–2). The word "alphabet" is derived from the first two letters of the Phoenician alphabet, *aleph* and *beta*.

The trading activities of the Phoenicians brought them into contact with the Greek world very early on. Many Greek communities may have had an element of Phoenician population; Herodotus describes how Euboea was originally settled by Phoenician travellers. Representations in Greek literature of Phoenician traders conjure up pictures of hostile pirates or pacific merchants. Their trading movements required sailing skill and well-constructed ships. The shipbuilding timber of the Levant coast was famous in antiquity. It is quite likely that the Phoenicians invented the bireme sometime in the 8th century BC: their warships were fitted with rams and must have influenced Greek shipbuilding technology. In the 6th to 4th centuries BC the Phoenicians supplied fleets to the Achaemenid kings whilst under Persian rule, and later to Alexander the Great when he overran the coastal cities in the 330s.

Phoenician presence within Greek communities expanded from the 5th century onwards. From the end of the 4th century the Phoenicians themselves were absorbing different aspects of Greek culture. This is best seen in the bilingual inscriptions of the Hellenistic period set up to worship Phoenician deities.

More is known about the Phoenicians from their own colonies in the Mediterranean (e.g. Sicily, Sardinia, Malta, Spain, and North Africa) than is known from their native coastal cities (Bunnens, 1979). Some sites, apparently known in antiquity as Phoenician, suggest a different ethnicity from their inscriptions in Aramaic. It is almost certain that the Greek idea of "Phoenician" was very broad, and may have been applied to traders from the eastern Mediterranean seaboard rather than the identifiable Phoenician centres (Morris, 1992). Their cultural presence outlived any political strength in the Hellenistic and Roman periods.

Summary

A seafaring people from the cities of what is now Lebanon, the Phoenicians established trading settlements throughout the Mediterranean (Cyprus, Sicily, Sardinia, Malta, Spain, north Africa). They brought to Greece not only their own culture and alphabet but also the cultures of their Assyrian and Mesopotamian neighbours. Few texts survive but they were famous for glassware, metalworking, and shipbuilding.

Photios *c.*810–*c.*893

Patriarch of Constantinople, statesman, scholar, and writer

Born around 810, or a little later, into an upper-class family which had been persecuted by the iconoclasts but which had a tradition of public service, Photios himself rose to the position of *protasekretis* (head of the imperial chancellery) and took part in an embassy to Baghdad (in 838, 845, or 855). Upon the forced resignation of Ignatios as patriarch in 858, Photios, the neutral candidate, was chosen to succeed him with the backing of Bardas, the uncle of the youthful emperor Michael III. For the next eight years Byzantium enjoyed one of the most successful periods in its history, effective rule being in the hands of Bardas and Photios. Among their most far-reaching triumphs were the baptism of the Bulgar tsar Boris-Michael and the mission of Constantine (Cyril) and Methodios to Moravia. Photios's speedy election from layman through all the degrees of the priesthood to patriarch in a mere five days was, however, uncanonical though not unprecedented (it is strikingly similar to the election of, among others, his uncle Tarasios) and embroiled him with the papacy. After initially accepting with reluctance the validity of Photios's election, pope Nicholas I condemned it, a move repeated in Constantinople in 867 when the new emperor Basil I, siding with the extremist Ignatian party and desiring western help against the Arabs, deposed Photios and restored Ignatios. However, after Ignatios's death in 877, Photios was recalled from exile, reinstalled as patriarch, and reconciled with the papacy. Later, having taken the part of Basil in the emperor's quarrel with his son Leo, Photios was once more both deposed and exiled on Leo's succession to the throne in 886. Photios's death is unrecorded, but it probably occurred after 891.

In the "Photian schism" both political and ecclesiastical factors were involved in the pope's claims to authority over Illyricum and Bulgaria and in the doctrine of papal supremacy. To bolster his position, however, Photios brought up a purely theological point in his condemnation of the western Church's unofficial addition to the creed of the *filioque*, which gives a double procession to the Holy Spirit from the Son as well as from the Father. The *filioque* and papal supremacy remain today the two main obstacles to the reunion of the Roman Catholic and the Orthodox Churches. Photios's principal exposition of his arguments, the lengthy treatise *On the Mystagogy of the Holy Spirit*, entitles him to be classed as a theologian. This claim may be strengthened by the theological discussions in his *Amphilochia*, by some of his *Homilies* and *Letters* (in particular an encyclical to the oriental patriarchs), and by a polemical treatise on the Paulicians which is, however, based upon a work by Peter of Sicily. Regarded in the East as a saint and the upholder of true doctrine, Photios was vilified for centuries by Catholics in the West who suppressed or were ignorant of his reconciliation with the pope. They regarded him simply as the villainous opponent of the papacy and the arch-destroyer of Church unity. His rehabilitation came as recently as the middle decades of the 20th century through the meticulous research of the Czech Byzantinist Father Francis Dvornik.

Whether or not Photios was ever a teacher at an institution of higher education in Constantinople before his elevation to the patriarchate is fiercely debated by scholars, but that he and his older contemporary Leo the Mathematician were the leading intellectuals of their day there can be no doubt, and they can be regarded as the prime movers in the cultural revival of the middle Byzantine period. The tradition of Byzantine humanism, which can be said to have continued until the fall of the capital in 1453, was in its inception largely due to them and especially to Photios. Both men immersed themselves in and encouraged a study of ancient texts, but Leo had more a scientific and philosophical bent, Photios a literary one. Photios's own writing aims at a harmonious combination of levels dictated largely by his subject matter, but he never descends to the vulgar and shies away from the pretentiousness of indulging in figures of speech for their own sake. Although he has a tendency to abstraction, he can be graphic and some of his descriptions are brilliant. His use of Classical (and biblical) allusions is often subtle and employed in imaginative ways, and it is notable that he has the courtesy to avoid them when addressing an audience that would presumably have been unable to appreciate them. His vocabulary is varied and shows evidence of his enormously wide reading, a by-product of which is his surviving *Lexikon*, probably a youthful work, which he entitles *Alphabetical List of Words which Lend Particular Elegance to the Compositions of Orators and Prose-writers*. This was written ostensibly for the benefit of a friend reading Classical authors, but Photios's lexical interests continued into his later career when he made additions to the *Etymologicum Genuinum*.

Some of his 19 *Homilies* are traditional in form, but others are innovative in introducing into sermons secular aspects of political speeches and the *ekphrasis* (rhetorical description). The most notable examples of the former are two homilies on the attack by the Rus on Constantinople in 860, and of the latter one on the church of the Virgin of the Pharos and its symbolism and another on an image of the Virgin (most probably the surviving mosaic in Hagia Sophia), both of which are of inestimable value in depicting a Byzantine's emotional reaction to a work of art.

Photios's 299 *Letters* are addressed almost exclusively to emperors, civil and ecclesiastical leaders, and foreign dignitaries. Some are tracts, such as that on the duties of a monarch addressed to Boris-Michael of Bulgaria and that on the heresy of the Theopaschites sent to Ashot of Armenia. Others cover the whole range of epistolary topics from recommendation to consolation to reprimand. Many were written in exile defending his position and encouraging his friends who were suffering because of their support for him. The *Amphilochia* consists of answers to 329 theological, philosophical, linguistic, and even scientific problems addressed to Amphilochios, metropolitan of Cyzicus. Some of these answers are to be found also among his *Letters*.

Photios's most famous work is the *Myriobiblon* or *Bibliotheca*, a collection of 280 chapters containing reviews of 386 books allegedly requested by his brother Tarasios. It is an astonishing work, but there has been no scholarly consensus on its date, purpose, and manner of composition. Slightly more than half the texts are of theology, hagiography, and ecclesiastical history. Others are scientific – geographical, agricultural, medical, lexical, and grammatical. The remainder are of secular literature with an emphasis on historiography and oratory, but including six romances. "School texts" such as Homer, the tragedians, Aristophanes, Plato (and Aristotle) are omitted, presumably because they were well known, and there are only two chapters on poets (one on the 5th-century poetess Eudocia and one on five Egyptian poets). The reviews vary greatly in size, but typically contain the author's name, title, dedication, biography, summary (often including quotation), and evaluation which both corrects errors of fact and doctrine and comments on stylistic features. Of the books mentioned 78 survive today only in part (51 of these only in fragments) while 110 are completely lost, of which 81 are nowhere else even attested. Photios thus remains the sole witness to the existence of a sizeable quantity of Classical and Byzantine literature.

Photography

The ancient monuments of Greece were an obvious subject for photographs, from the very first moments when the practical techniques of photography were invented. This occurred in 1839, with the separate processes developed by Louis Daguerre in France and William Henry Fox Talbot in England. Daguerre's process produced a positive image of the subject photographed on a silvered copper plate. The resulting pictures were of a very high quality, but suffered from the distinct disadvantage that only the single original photograph was produced (called, after its inventor, a daguerrotype). Fox Talbot's system (called talbotype, or, more generally, calotype) produced in the first instance a negative image on paper, which was then used for the second stage to produce a paper positive. The results of Fox Talbot's system did not, at first, have the quality of the daguerrotypes; the double process, the texture of the paper, and the patent restrictions demanded by Fox Talbot (unlike Daguerre, who encouraged the use of his process) militated against them. But calotypes did have the immense advantage that a large number of prints could be made from each negative, while the only way to reproduce the results of Daguerre's system was to make engraved copies, which inevitably put the skills of the engraver between the published result and the original photograph.

The earliest photographs of Greece were daguerrotypes. They followed in a tradition of artists' images of Greece and its antiquities that went back to the 18th-century travellers and artists. A French publisher, Noel Lerrebour, sent trained daguerrotypists to various parts of the world, to secure images as the basis for engravings published in a work entitled *Les Excursions Daguerriennes*. The photographer sent to Athens was Pierre Joly de Lotbinière, a French Canadian. His original photographs do not survive, but the published engravings include, inevitably, a view of the Parthenon, with the little Turkish mosque still standing within it, photographed in September 1839. Others are a view of the temple of Olympian Zeus, with the column later blown down in a gale still standing, and the "stylite's hut" still in position on the entablature, and a view looking out through the ruins of the Propylaea.

The oldest original daguerrotypes of Greece to survive are now in the Gernsheim collection in the University of Texas. They were made in 1842 by Girault de Prangey. One of them shows the Byzantine "Little Metropolis", with the modern cathedral of Athens under construction in the background. The best early calotypes were made in 1848 by the Revd. G.M. Bridges, and were sold in a portfolio, together with a variety of other photographs from different regions. The production of such portfolios became the favoured method of selling photographs, and, with improvements in the technique of making the original negative, put an end to the daguerreotype system, which was obsolete by the 1850s. The new negative system was developed in 1851 by Frederick Scott Archer, who used glass plate negatives, which were coated with a wet collodion emulsion. The process was still cumbersome (the plate had to be prepared and exposed before the emulsion dried) and in practice could be used only by professionals, who thus had a ready market in the increasing numbers of travellers to Greece, or artists, such as Sir Lawrence Alma Tadema, who made a vast collection of photograph prints, including the Classical monuments of Athens, as a basis for his Neoclassical paintings.

The last calotypes were made in the early 1850s, and include excellent photographs by Alfred Normand, now in the library of the French School of Archaeology at Athens, showing among other subjects the west end of the Acropolis before the excavation of the Beulé gate, and the temple of Olympian Zeus, again with its "stylite's hut", just before the gale that felled one of its columns. Then the wet-collodion process led to what has been justly termed the golden age of photography in Greece. Many photographs were produced by foreigners and sold elsewhere. An early example is James Robertson, employed by the Ottoman mint in Constantinople, who began photographing in Athens (as well as elsewhere) in 1853: he is probably responsible for a series of photographs of Athens of that date collected by field marshal Sir John Lintorn Simmons. Photographers based in London who made and sold excellent photographs of Greece include Francis Frith, whose first Greek photographs date from 1859 or 1860, and Francis Bedford, who visited Greece and other countries in the east Mediterranean at the express command of queen Victoria, accompanying the prince of Wales in 1862.

The climax of this phase came in the late 1860s and early 1870s, and is associated above all with three photographers, William Stillman, former American Consul in Canea and subsequently correspondent in Rome for *The Times*, who made photographs for his great album *The Acropolis of Athens* in 1869; Pascal Sebah, who had his photographic establishment in Constantinople; and Felix Bonfils, who worked from Beirut. Using very large glass plates, all three took photographs of unsurpassed quality, which found a ready market both in the form of albums and as individual prints. Those of Stillman were eventually sold by the Society for the Promotion of Hellenic Studies in London, who still possess an original negative of 1869, as well as the negatives of a later series taken by Stillman in 1882.

All this stimulated the development of photographic establishments in Greece itself. The earliest Greek photographer, Kostas Makedonas, began experimenting with the techniques in 1848, but the first fully professional studio in Athens was that of Phillippos Margaritis, who won prizes in international exhibition, for his photographs of the Acropolis and Athens in the mid-1850s. He also found a ready market for portrait photographs made for individuals in Athens. A slightly later photographer, Petros Moraitis, worked for an extended period in the 1860s, 1870s, and 1880s, and was the first holder of the title of Photographer to the King of Greece; again, much of his work comprises photographs of individuals, as well as views of the monuments. Other important Greek photographers included the Rhomaides brothers, in the later part of the 19th century. They took the usual views of ancient sites for tourists, but also worked specifically for archaeologists; they were the

Photography: view of Athens from the southeast by William Stillman, 1869

photographers for the Athens Archaeological Society, and took the photographs of the German excavations at Olympia in the mid-1870s.

By the late 19th century photography had become a much simpler and faster process. Ready-made dry photographic plates removed the necessity for working with wet chemicals while taking the actual photographs. Stillman's second series of Athenian views were made with dry plates, though the results lack something of the quality of the earlier series. The subsequent development of roll film put photography within the reach of virtually every tourist, and though the professional photographers continued to flourish, they are now too numerous even to list.

Physics

Physics is one of the basic sciences in the development of human civilization. The semantic framework that defines modern physics was formulated through a series of procedures and modifications that are themselves studied by historians of science.

For many, the foundations of physics are based on the formulations proposed by certain ancient Greek philosophers concerning the interpretation of the world and the phenomena

that evolve in it. These philosophers included Pythagoras, who attempted to pinpoint the physical principle of sight *c.*500 BC; Parmenides, who denied the reality of motion; and Anaxagoras, whose thoughts were directed in the opposite direction. Certain atomistic philosophers should also be mentioned, such as Leucippus, Epicurus, and Democritus. But it was Aristotle who formulated a system of physical philosophy that dominated Western civilization up to the 17th century, when the so-called "scientific revolution" took place and many Aristotelian views were rejected or reformulated, notably by Isaac Newton and his successors.

Aristotelian natural philosophy was the basis for further research about natural phenomena through observation. The main contribution of Aristotle was that he created a cohesive framework of principles and rules which govern the world, including both living creatures and non-living matter. For Aristotle there was no dispute about the reality and objectivity of the material world that is understood through human senses. He argued that there is no vacuum, a concept which he considered problematic to the way he tried to explain physical phenomena, and especially to the way he determined the movement of bodies. Aristotle made a distinction between natural motions and violent motions.

Another significant contribution of Aristotle was to transmit the hypothesis of Empedocles that the fundamental elements of all bodies are fire, air, water, and earth. These four elements were considered to be the only simple bodies for centuries, until modern chemistry proved that air was a mixture of several gases and water a compound of hydrogen and oxygen. This supposition was also compatible with the theory expressed by Aristotle that all bodies move in a way that brings them to their physical place. Lighter bodies move upwards, heavier ones downwards towards the centre of the earth. This was an example of natural motion, while the motion of a projectile was a violent one. Concerning the fall of heavy bodies Aristotle stated that they are attracted by means of their heaviness. The closer the bodies come to the earth's surface, the more the property increases. The impossibility of a vacuum, incidentally, led Aristotle to formulate a principle analogous to that of inertia.

During the Hellenistic period physics retreated as a discipline of science and other, more descriptive fields, such as geography and natural history, became more popular. Meanwhile, the influence of the Neoplatonic school was maintained. At Alexandria several scholars, such as Ammonius and his student Philoponus, tried to link ancient Greek natural philosophy with the Christian faith.

Little is known about the understanding and development of physics in Greek Orthodox Byzantium. The absence of detailed texts does not necessarily mean that physics was not studied during this period. Indeed, the Fathers of the Church such as St Basil the Great and his brother Gregory argued that it is not possible for man fully to understand God, and accordingly the laws he gave to the universe. Therefore physics, as the science responsible for finding out what these laws are, took the form of a commentary on what the scriptures say on related subjects.

Nevertheless during the reign of Herakleios (610–41), Stephanos of Alexandria taught Plato, Aristotle, and the subjects of the quadrivium, namely arithmetic, geometry, music, and astronomy in the "university" of Constantinople. In the 7th century Kallinikos of Heliopolis in Syria is said to have invented Greek fire. In the following centuries a number of works were written dealing with mathematics, medicine, astronomy, and astrology but few may be considered as relevant to physics. In the 12th century Michael of Ephesus published a commentary on the *Generation of Animals* and other works of Aristotle.

During the Latin occupation of Constantinople (1204–61) the sciences developed in the empire of Nicaea. One of the most prominent figures of that period is Nikephoros Blemmydes (1197/98–1272). Blemmydes taught in his own monastery at Ephesus and his writings include an *Epitome of Physics*. But the main subjects of interest during this very creative period were once again mathematics and astronomy.

Throughout the Byzantine period, Aristotelian philosophy constituted the dominating "paradigm", acquiring a characteristic that prevented the expression of criticisms and speculations. At the same time, the Church also accepted it, both in the West and in the East, since theologians believed that the Aristotelian model of the world coincided with the writings of the Holy Scriptures. Therefore the support for Aristotelian philosophy shown by the official Churches made it even more difficult to contradict it.

It should be noted that – as with all works that endure the passage of time – ideas and views that were not initially expressed by Aristotle but were due to medieval annotators were gradually incorporated into the corpus of Aristotelian ideas. Commentary on Aristotle's works was also the first direction taken by Greek scholars concerned with physics after the fall of Constantinople in 1453. Of significance were Gerasimos Vlachos, Nikolaos Koursoulas, and Alexandros Mavrokordatos, with Theophilos Corydalleus also playing a leading role. Corydalleus influenced the thought of the period to such an extent that it became known as the Corydallic period and its methodological approach formulated a new school – that of Corydallism. In his work he tried to escape from strict adherence to Aristotelianism and to develop a more creative approach to it. The influence of Aristotelian thought is also evident in the way that Alexander Mavrokordatos determined the procedure for teaching physics. But a wave of doubt about Aristotelianism arose from the middle to the end of the 18th century.

A new way of thinking about physics, which was formed in 17th-century Europe – especially in the theories of Isaac Newton, René Descartes, and Gottfried Leibniz – reached the Greek intellectual scene via Italy. There, at the University of Padua, Nikiphoros Theotokis, Nikolaos Zerzoulis, Evgenios Voulgaris, and Josephos Moisiodax were taught experimental physics by the distinguished Italian scholar Giovanni Poleni. At the same time, they came into contact with the literature of international scholarship and thus had the opportunity to acquire and to study the most significant physics books of that period, which would later be used as sources for their own writings.

Of the four scholars mentioned above, Theotokis, with the publication of his work *Elements of Physics*, was responsible for introducing physics at that period to southeastern Europe. The most radical was Moisiodax, who believed that Aristotelian thinking poisoned the hearts of the young since it

rejected evolution. In practice, however, European physics was successfully combined with certain basic principles of Aristotelianism, such as the maintenance of the inductive method, and Greece has continued to play a full part in the subsequent development of physics as an academic discipline in the international tradition.

Pikionis, Dimitris 1887–1968

Architect

Distinguished architect, city planner, and painter, Dimitris Pikionis merged in his work the basic tenets of modern architecture with essential elements of Greek tradition.

Pikionis was born in Piraeus and studied civil engineering at the Athens Polytechnic. There he was the contemporary of such future celebrities as painter Giorgio de Chirico, Byzantinist Anastasios Orlandos, and the historian of Athens Dimitris Kambouroglou. He studied painting and architecture in Paris and returned to Greece in 1912 to join the campaigns of Balkan Wars and World War I. In 1925 he became associate professor at Athens Polytechnic.

In 1932 he designed the primary school complex in Pevkakia at the foot of the Lykabettos hill. A stark functional structure, it maintained the scale that was appropriate for its fragile environment. After 1935 Pikionis began to combine the universality of modernism with the particular aspects of Greek tradition, ancient, Byzantine, and folk. In 1943 he was elected full professor in Athens and after the war he worked for the Ministry of Reconstruction by travelling all over Greece in search of the authentic features of Greek architecture. In time he gave up modernity for tradition.

The period 1950–57 was his most creative. Among other works he designed the Xenia hotel in Delphi, the Potamianos home in Philothei (suburb of Athens), and his masterpiece, the unification of the archaeological site around the Acropolis, the hill of Philopappos, and the tourist kiosk of St Demetrios Loumbadiaris. The work involved the creation of two spiral paths, one leading from the main road of Dionysios Areopagitis to the Acropolis and the other to the Philopappos monument on the opposite hill. Pikionis made these paths with a mixture of marble and stone fragments that cancel out all reference to the industrial present. This most conclusive of Pikionis's creations is not a work of reconstruction but a journey into the collective cultural subconscious (as Jung would put it). At a time when the Athenian landscape and its natural environment were disappearing under the onslaught of the postwar construction boom, Pikionis designed this monumental walk around the ancient citadel to preserve the fading memory of a pre-industrial habitat.

In 1961 he became honorary professor of the Munich Academy of Fine Arts and designed a children's playground in Philothei, the town hall of Volos, and an ecclesiastical centre of learning on the island of Tinos. In 1966 he became a member of the Academy of Athens. Pikionis was a figure in Greek architecture with a profound influence on a select number of Greek intellectuals. His attachment to the Greek landscape and local tradition defied the universality of modernism, but he equally rejected the elements rooted in the land and in human dwellings.

Pilgrimage

Pilgrimage, in the Greek context, is an awkward term for the "journey of a pilgrim". The Latin word for "pilgrim", *peregrinus*, a foreigner living outside the territory of Rome and travelling to a shrine or sacred place (to fulfil a religious duty, to pray, and to receive blessings or some other religious benefits), refers specifically to the aspect of travelling, the journey. The

Greek words for pilgrimage (*proskynisis*, literally "veneration") and pilgrim (*proskynitis*), however, come from the verb *proskyneo* meaning "I kneel and worship", which has an entirely different connotation. Greeks go to shrines and sacred centres for the purpose of veneration: to kiss the icons, to venerate the relics, to make confession, and to discuss personal matters with their spiritual fathers. In the Greek context, therefore, the core meaning of pilgrimage is not the "journey" but the "veneration".

Holy place, in the Greek context, is an equally awkward term for a "sacred centre". The early Christians did not attribute holiness to places, and indeed had no holy places for the first three centuries. There is no evidence that Jewish Christians or other Christians designated sites as holy or sacred before the beginning of the 4th century. Their attitude towards holy places and pilgrimages was, in fact, negative. Eusebius of Caesarea (*c.*260–339), for example, was extremely reluctant to countenance any talk of holy places. Moses had promised a holy land to the Jews. Holy places were what Jews and pagans had. On the other hand, Christianity was a spiritual religion and Jesus had promised his followers a "much greater land, truly holy and beloved of God, not located in Judea". Only a heavenly Jerusalem could be the holy city for the Christians. Pilgrimage was prescribed neither in the Bible nor by the Church Fathers.

The Greek pilgrimage tradition originates in remote antiquity, when the population of every town honoured their tutelar deity in solemn processions to his or her temple. At the time of the original Olympic Games, the temple of Zeus at Olympia became the "pilgrimage" centre for multitudes from every Hellenic country. The shrines of the oracular divinities, that of Apollo at Delphi in particular, attracted private and official visitors all year round. Visiting cult centres was also common among the ancient Israelites. With the restriction of Yahweh worship to Jerusalem, the sanctuary on Mount Moria became the principal centre of Jewish pilgrimage.

Cyril of Jerusalem (d. 386) was the first bishop to embrace the emperor Constantine's enthusiasm for building churches on biblical sites in Jerusalem, which he did after the Council of Nicaea in 325. "Others merely hear", Cyril told his catechumens; "we see and touch." Historical curiosity combined with pious zeal began to motivate an ever-increasing number of Christians to go and see the biblical sites where Jesus was born, lived his earthly life, and was crucified and resurrected.

To Cyril, Jerusalem was a holy city not because God had been involved there in the past, but because it had "a specific quality in the present". The ritual processions around the churches and the related sites replaced the prevailing pagan, Jewish, and Samaritan cults in places that had a biblical association. This brought the physical sites and the narrating of the corresponding biblical events into close proximity. In Jerusalem, story, liturgy, and site became one; the past became the present. The commemoration of the life of Christ thus affected the choice of biblical narrative to be read, so that it suited not only the site, but also, and in the course of time more exclusively, the liturgical season.

Before the end of the 4th century Jerusalem as a holy city evoked mixed feelings. Gregory of Nyssa, for example, considered it necessary to excuse his visit to Jerusalem by stating that travelling there did not bring man closer to God. The early Christians did not consider their churches as temples of a divinity. They were rather built for the specific purpose of congregating and gathering "the living temples" (i.e. Christians) of God into one. It was the gathered community and their liturgy that were holy, not the church that housed it nor the place per se.

Attitudes towards relics were also hesitant at first. Jerome, responding to the attack on the cult of relics and holy places in Palestine by Vigilantius (born 370), realized that the means used to honour God were similar to those already used for honouring gods, and that martyrs were now honoured in ways that were previously considered idolatrous.

The decisive and final shift in attitude corresponds to Augustine's own acceptance of the prevalent belief in the everyday occurrence of miracles, which arose in the two first decades of the 5th century. His change in attitude was brought about when, almost daily in his pastoral work among his congregations, he was witnessing miracles wrought by the relics of St Stephen which had recently been discovered and brought to Africa.

In her account (*c.*381–84) of the prevailing custom of visiting *martyria*, or churches that had been built on the tomb of a martyr or a saint, the pilgrim Egeria remarks that specific passages from scripture became attached to specific sites and the events associated with them: readings *apta diei et loco*. She

also notes that the monks in the region of Charra of Mesopotamia lived in seclusion and came out only occasionally, notably at Easter and for the feast of the martyr, to participate in the liturgy in the *martyrium*.

The cult of martyrs prepared the way for the idea of holy places, and gave the place a new sacred significance; it bridged the need to make the present (in post-Constantinian conditions) the past of the persecuted Church. It abolished the gap between the generation of martyrs and later generations. The places were derivatively rather than intrinsically holy, however, being the sites of historical events of sacred significance. The miracles witnessed in the *martyria* in particular seem to have been the cause of the rapid growth of the pilgrimage movement in the early 5th century. The cult of images became popular, too, due to the miracle-working icons.

Since it was not the place but the congregation and the relics that were originally regarded as holy in the early eastern Churches, visitors or pilgrims did not need to make the journey to the temple or to the "holy places" of Christendom. To them, pilgrimage implied spiritual participation in the life of Christ, as expressed in the liturgy. This attitude gave rise to another kind of pilgrimage, namely that of visiting holy men and women who had dedicated their lives to perpetual prayer: monks and ascetics. When Basil of Caesarea, for example, visited Palestine in 351, he went there to stay with the monks and ascetics to unlock the secret of their holy lives. He wanted to learn about personal spiritual pilgrimage; the destination was the heavenly city of God, as experienced on an internal level.

With the growth of the ascetic movement, the monasteries in 4th-century Egypt soon gave it the status of a second Holy Land. Travellers who visited Jerusalem felt the need to visit the ascetic houses of the Nile too. Most monasteries became pilgrimage centres in the following centuries. Notable among these were St Catherine's on Mount Sinai, built in the 6th century on the site of the Burning Bush at the foot of the craggy peak where God delivered the Tablets to Moses, and the great monastery of Stoudios in Constantinople. This development went hand-in-hand with the cults of relics and images, and with the veneration of holy men and women. All newly founded monasteries had some relics, which also became objects of veneration on the death of well-known hermits and spiritual fathers.

Between the early 4th and the mid-7th centuries, men and women, young and old, rich and poor came to the biblical sites in the Holy Land, following in the footsteps of Constantine's mother Helena. At first it was the Old Testament site of Mount Sinai in particular that attracted the pilgrims, but these were later superseded by the sites associated with the life and Passion of Christ. The pilgrimages turned into a circuit of sites starting from the tomb of Christ at the Holy Sepulchre. Pilgrims descended from the Mount of Olives on Palm Sunday and formed a citywide procession during which thousands of visitors were entertained and exploited by the many commercial fairs and festivals.

The growth of pilgrimage was accelerated by the belief that sanctity was somehow transferable through physical contact. Some pilgrims therefore came to the Holy Land to intensify their faith by means of prayer and through revelation, others brought offerings and votives. Many came for miraculous healing of various diseases and illnesses, and there were those who came to seek advice, and to do penance.

Travel was slow. It was speedier by sea and more comfortable. Most pilgrims went overland by donkey or on foot, the daily distance being around 30 km. The Bible, maps, guidebooks, and letters of introduction were the prerequisites of every pilgrim. Letters of transit were needed at the frontiers before permission was granted to join the official highway system known as the *cursus publicus*. Along the pilgrimage routes were local guides who pointed out the sites and assisted in dealing with hostile natives, bandits, and robbers. Travelling in groups was more or less obligatory under these circumstances.

A pilgrimage could be made at little expense, because the local Christian community was obliged to take care of travellers. There were both Church- and state-endowed hostels as well as commercial hotels and camping grounds. The indigent and the sick found their haven in the church hostels, as did monks, nuns, and theologians. The merchants traded as they travelled. The aristocrats could afford themselves some comfort during the journey, and the soldiers were used to camping. The bureaucrats were always welcomed at the state-endowed hostels. In principle, therefore, a pilgrimage could be made by anyone.

When pilgrimage became part of popular religion, it inspired the production of a wide variety of minor pilgrims' *evlogia* ("blessing") artefacts, such as small pieces (diameter 1–10 cm) of sanctified earth, identifiable by the stamped impression. The token of Symeon the Stylite the Younger (521–92), in which the seal impression shows the saint on his column flanked by angels with crowns or palm fronds, and a monk climbing a ladder towards him, was the most common *evlogia* at the time. These pieces of portable pilgrims' tokens, "the *evlogia* made from dust and blessed by him", were carried home for their apotropaic and medicinal powers. In the hour of need they were crumbled into dust and applied externally, either dry or in a paste. The effect was believed to be both prophylactic and curative.

With Palestine and Sinai in Arab hands, pilgrimage to the Holy Land became virtually impossible. Constantinople, the heart of Byzantium, became the new pilgrimage centre. The great monastery of Stoudios and the other 350 monasteries in the capital soon became havens for thousands of pilgrims and visitors. Pilgrimage to the tombs of famous spiritual monks, notably those of the healer monk Theodore of Sykeon (died 613) and the wandering hermit Luke the Stylite (died 953), became an important Byzantine religious phenomenon, and continued to be so throughout the era.

With Constantinople in Turkish hands from 1453, Mount Athos became the new heart of Byzantine monasticism and pilgrimage. The Athonites were attracting monks and pilgrims from non-Greek lands, including the various Balkan countries and Russia, as early as the 10th century. During Ottoman rule (1430–1912), the monasteries of Mount Athos became pan-Orthodox centres of pilgrimage, with a large network of benefactors among the wealthy Serbs and Russians in particular. European bibliophiles visited it too, in search of lost manuscripts and rare books, but also for spiritual reasons. Today more than 40,000 men from all over Europe visit the Holy Mountain every year. In the modern Greek context a visit there

is by definition a pilgrimage in the sense of venerating the icons and relics, as well as making confession to a spiritual father, receiving his advice for the future, and experiencing, with the monks, the presence of God in the services. This is also why the tomb of the famous spiritual Athonite monk of our time, Father Paisios, near Thessalonica, is rapidly becoming a pilgrimage centre. Other significant centres include the convent of the Annunciation at Ormylia on the Chalcidice peninsula, and the Kechrovouni convent on the island of Tinos, renowned for the increasing number of educated women visiting the shrine of the Mother of God.

Pindar *c.*518–*c.*438 BC

Lyric poet

Pindar is best known today for his four books of epinician (victory) odes which were written on commission to celebrate victories at the great games of ancient Greece. By a mixture of direct praise and the interweaving of heroic legends, they glorify the aristocratic life, whose pinnacle is victory at the games and recognition for it.

In the 2nd century BC Pindar's work was divided into 17 books, roughly according to genre. Of these the four books of epinician odes survive virtually complete. Fragments of poems in other genres survive: hymns, paeans, dithyrambs (two books), processional hymns (two books), maiden songs (three books), choral songs (two books), praise songs, and dirges. These poems, where the evidence allows of an opinion, were, like the epinicians, written on commission. In the circumstances, it is difficult to disentangle the poet's own sentiments and autobiographical material from the restrictions and demands imposed by the conventions of the medium. Many of the opinions and value judgements expressed are revealed, on comparing the epinician odes of Bacchylides, as part of the baggage carried by a writer in this genre: it celebrates victory through toil, but victory and toil appropriate to aristocrats who have the time to exhaust themselves in the non-productive pursuit of kudos. Nevertheless, it is possible, by judicious examination of internal allusions and external sources (e.g. victors' lists), to get some idea of the progress of Pindar's career, at least as a writer of epinicia.

The epinician odes are divided into *Olympians* (14), *Pythians* (12), *Nemeans* (11), and *Isthmians* (8 as well as fragments). Not all celebrate victories in these games: *Nemeans* 4 and 9 record victories at the Adrasteia in Sicyon; *Nemean* 10 a victory at the Argive Heraia; *Pythians* 2 and 3 are epistles to Hieron of Syracuse; *Isthmian* 2 an epistle to Xenocrates of Acragas, and *Nemean* 11 celebrates the appointment of Aristagoras of Tenedos to a magistracy. Almost all of the latter, however, make some allusion to the games, and follow the same overall pattern as a typical epinician.

This pattern – very roughly speaking – is, at some point in the poem, to give the details of the victory or set its scene briefly and, as soon as possible, to present one or a series of stories associated with the legendary traditions of the homeland of the victor and/or patron. The linking passages are often tenuous. Consider for example the very earliest epinician (*Pythian* 10, for a Thessalian winner in the boys' double foot race), where Pindar compares his technique to that of a bee, which flits from one theme to another (lines 53–54). Early as the ode is, it already fixes the mould in which most were cast: the victor and his family are introduced and praised, especially his father, whose good fortune extends as far as a mortal's can; but even farther are the Hyperboreans, with whom Perseus once feasted; there follow praise of the Hyperboreans and a brief allusion to the slaying of the Gorgon, whose severed head turned men to stone; no miracle is beyond belief; the finest victory hymn flits like a bee from one theme to another; the poet hopes that his poem will glorify the victor in the eyes of others, and praises the ruler of Thessaly (who seems to have commissioned the poem from him).

The victors range from the very rich who entered victorious chariots to boxers and wrestlers. There is even one *aulos* player (*Pythian* 12 for Midas of Acragas). But all are encompassed within the aristocratic ideal of nobility and noble deeds. Pindar's most distinguished patrons were the Sicilian tyrants Hieron and Theron and members of their entourages. It is clear that the poet spent several months at least in Sicily, during the Olympic year 476 BC. He wrote three odes (*Pythians* 9 in 474 BC, 4 and 5 in 462 BC) for Arcesilas of Cyrene, in which he alludes to his own family connection with the Spartan clan of Aegeidae. But those for whom he wrote the largest number of victory odes (11) were victors from Aegina: he may have spent the years immediately before and after the Persian invasion of 480–479 BC on this island (*Isthmian* 5 of 480 BC refers to the battle of Salamis, and *Isthmian* 8 of 478 BC to the removal of the danger threatening Hellas). At *Nemean* 7. 61 he calls himself a *xenos* (guest) of the Aeginetans. It is to be remembered that not all Thebans supported the dominant faction of Medizers: 400 fought with Leonidas at Thermopylae

(Herodotus, 7. 202), and after the Battle of Plataea the victorious Hellenes punished only the leading Medizers at Thebes. If it is true that Pindar was later criticized at Thebes for writing in praise of Athens, this must also be seen in the same context of divided loyalties.

Pindar's epinician career began when he was 20 in 498 BC, with a commission from Thessaly (*Pythian* 10). In the year of Marathon he had his first commission from Sicily (*Pythians* 6 and 12 for Acragas). During the 480s and early 470s BC he wrote for Boeotian Orchomenus (*Olympian* 14), Athens (*Pythian* 7 for an Alcmaeonid), Attic Acharnae (*Nemean* 2), and Aegina (*Nemean* 5, *Isthmians* 5, 6, 8). The decade or so following the Persian invasions marks the high point of his popularity and production in this genre: three odes for Thebans (*Isthmians* 1, 3, 4), three for Aeginetans (*Isthmian* 8, *Nemeans* 3, 4), one for Cyrene (*Pythian* 9), and an impressive thirteen for Sicily and southern Italy (*Olympians* 1, 2, 3, 6, 10, 11, 12, *Pythians* 1, 2, 3, *Nemeans* 1, 9, *Isthmian* 2). There are signs, however, that towards the end of this period Pindar found it harder to get patrons (*Isthmian* 2 of *c.*470 BC is a letter to Xenocrates of Acragas which seems to be a request for payment). For the rest of his epinician career, he cast his net more widely: there were still Aegina (*Olympian* 8, *Nemeans* 6, 7, 8), although that island's conquest by Athens almost completely cut off this source (only *Pythian* 8 of 446 BC comes from after the conquest), and Thebes (*Pythian* 11, *Isthmian* 7), but also, on the mainland Opous (*Olympian* 9), Corinth (*Olympian* 3), and Argos (*Nemean* 10), and overseas Rhodes (*Olympian* 7), Cyrene (*Pythians* 4 and 5), Tenedos (*Nemean* 11), and Camarina (*Olympians* 4 and 5).

Pindar's poems were probably meant to be sung, and many to be accompanied by dancing. The music and choreography have been lost, and only the words remain. His poetry, regardless of the genre, is characterized by a controlled extravagance of language, and a skill and agility in linking apparently disconnected themes into a satisfying whole, which is unmatched by any other poet (one has only to compare the epinician odes of Pindar and Bacchylides to see how pedestrian the latter appear by contrast).

The epinician genre more or less died with Pindar, or rather with the drying-up of the supply of patrons. The tyrannical regimes of Sicily and Cyrene had been replaced by more broadly based governments, and in general rich individuals had other claims upon their resources, particularly in the unsettled conditions that prevailed throughout the second half of the 5th century BC. The result is that Pindar's poetry, when it was used as a model by later poets, was mined only for its extravagance of imagery and apparent convolution of expression. The poets of the Pléiade, for example, wrote so-called Pindaric poetry, which fails because it completely misses not only the music and dance, which were integral features of the original, but also the occasion to which the epinician genre is bound.

It was Aristophanes of Byzantium who divided the text of Pindar into 17 books; Aristarchus (2nd century BC) subsequently worked on the text, and Didymus (1st century BC) produced extensive commentaries. By the 3rd century AD only the epinicia were still circulating widely, perhaps, as Eustathios later claimed, because they had more of human interest and less of mythology than the other genres, and were also less obscure (Drachmann, 1926, Praefatio, 34). They were thus more suitable to be used as school texts. Later, in Byzantium, Pindar was studied more for his language than for his qualities as a poet. Eustathios (d. 1194) heralds a revival of scholarly interest, to be followed by editions made by Thomas Magister, Moschopulos (both 13th–14th centuries), and Triclinius (14th century).

Pindus

Mountain range in northern Greece

The Pindus mountain range stretches like a backbone through northern Greece in a position roughly analogous to the Pennine chain in England, with the difference that the Pindus is far higher and more impenetrable. Its highest peak, Smolikas, is over 2600 m above sea level, and the central Zygos or Katara pass is over 1700 m. There is now one other road over the Pindus through Konitsa, and a tunnel is being built to get over the difficulty that the Zygos pass is often closed by snow. In ancient times great generals such as Alexander the Great and Caesar won praise for their daring and leadership in crossing the Pindus, and up until modern times travellers crossing the mountains found it a hazardous experience.

The Pindus is not one range, but a series of limestone and greenstone ranges with high plateaux in between. These plateaux provide excellent summer pasturage, but are obviously difficult of access. Hence transhumance has been practised in the Pindus from ancient times until the present day with shepherds driving their flocks into the mountains each spring, returning them to the plains of Epirus and Thessaly in

the winter. Such transhumance has been particularly associated with the Vlachs. There is no certain evidence linking the Vlachs with the Pindus until the 14th century, although it is known that there were Vlachs in Thessaly and Vlachs practising transhumance before this date. The Pindus is the place where the largest concentration of Vlachs in the Balkans can be found, but there are also Greek villages in the area.

In Classical times there are references to tribes such as the Tymphaei living in the Pindus, but little is known about them. Strabo, perhaps going back to Hecateus, is well informed about the rivers which rise in the mountains (the Haliacmon, Peneus, Aous, Aspropotamus, and Arachthus) but is vague about the people of this area. In the Roman era there was no road across the Pindus, the roads in Epirus and Thessaly going from north to south rather than east to west. Strabo mentions towns at Tricca (modern Trikkala), Aeginium, Aethicia, and Chalcis (possibly modern Chaliki), all on the Thessalian side of the Zygos pass. The western side would appear to have suffered from the brutal Roman punishment of the Molossian defection in 168 BC.

The harsh climate of the Pindus and the absence of east–west routes are likely to have protected the mountains from barbarian invasions. The emperor Justinian (527–65) may have included some fortifications in the Pindus as part of his grand plan to defend the Balkans, and this might explain the presence of Latin speakers in the area. The ethnology of northern Greece is a difficult subject, since in spite of the remarkable survival of Greek there was undoubtedly a Slav invasion to the west of the Pindus in the 7th century, a Vlach presence in Thessaly in the 11th century, and in the 14th century incursions of both Albanians and Vlachs into the central Pindus area.

Under the Ottomans the economy of the Pindus mountains would appear to have taken on a more settled pattern. Villages like Samarina and Perivoli appear to have been founded as summer settlements; in return for tax privileges the inhabitants of such villages, themselves used to making long journeys, became the guardians and guides of other travellers making these journeys. The summer pastures provided a rich source of revenue, and merchants from Pindus villages travelled all over the Balkans, becoming very wealthy in the process. With the collapse of Ottoman authority, inhabitants of the Pindus including *armatoloi* (militia) and klephts continued to profit from their key position in the mountain passes, alternatively keeping the law and breaking it. In general the Pindus suffered at the end of the 19th century through brigandage, guerrilla war, and the creation of new boundaries which played havoc with the economy of the region. Brigandage was not unknown between the wars. In World War II control of the Zygos pass was a key factor in the Italian invasion (which failed to reach it), in the subsequent German occupation, and in the Civil War which followed. In all this warfare Pindus villages suffered badly, as the flocks which had been their livelihood were sacrificed for food, and the move from winter to summer pastures became impossible.

In the last half century the Pindus has revived. New roads have made travel much easier. Metsovo, in the heart of the Pindus, has become a minor tourist resort with skiing in winter, a pleasant climate in summer, and picturesque ethnic costumes for the visitor. Smaller villages have become more accessible, although it still takes a rugged bus ride to reach famous Pindus villages such as Samarina and Sirrakou, and electricity did not reach Chaliki until the 1980s. The biannual migration on foot from summer to winter pastures has now almost vanished, although the higher villages are still abandoned by car and lorry before the winter. The extensive pine forests provide, through timber merchants, an alternative form of employment to the sheep and goat breeding of the past, although wool products are plentiful in the tourist shops and mutton and cheese are staple items in Pindus meals.

Summary

A mountain range stretching through northern Greece like a backbone, the Pindus represents a barrier between east and west. The rugged terrain and harsh climate protected the mountains, though Albanians and Vlachs penetrated the central Pindus in the 14th century. During the Ottoman period merchants from the Pindus villages prospered but in the late 19th and early 20th centuries the economy was disrupted by brigandage.

Piracy

Ancient sources show that piracy has always coexisted with sea voyages and maritime trade. In the age that Homer described in the *Odyssey*, piracy was a profession that men entered as a recognized way of making a living. It was so widespread, and the consequences to its victims so disastrous, that settlements often moved away from coastal areas (where they were a target for raids) to locations further inland and were surrounded by protective walls (Thucydides, 1. 7).

War and piracy have always had much in common. The acquisition of booty was a vital element in ancient Greek warfare and in ancient sources it is frequently very difficult to distinguish between warfare and piracy. At the end of the Archaic period, however, with the development of organized states with mercenary armies, a distinction emerges. In the 5th century BC opportunities for plunder provided the impetus for several military offensives. During the Peloponnesian War each side plundered the other's territory by both land and sea. Several generals even used the methods of pirates to help finance their wars. These practices continued in the Hellenistic period. For example, Philip II of Macedon used the proceeds of piracy to finance the building of his navy. Another incentive to piracy lay in the custom of reprisals against an enemy.

As means of accumulating wealth, trade and piracy have much in common. Piracy posed a considerable threat to merchants: the pirates of Zancle were ideally placed to attack and seize ships passing through the straits of Messina between

Italy and Sicily. The Taurian tribes in the Crimea and the Thracians developed an organized system of wrecking ships for plunder (Diodorus, 20. 25; Xenophon, *Anabasis*, 7. 5. 12). This system became so widespread in Roman times that the Romans were obliged to impose penalties on wreckers. Illyrian pirates were another source of trouble. According to Polybius (2. 5), the Illyrians had always been in the habit of pillaging along the extensive Roman seaboard; as the principal cities were located in the interior, help against such raids was distant and slow to arrive, allowing the Illyrians to overrun and plunder the surrounding territory unmolested.

Piracy and the slave trade were also closely connected. The largest centres for both activities were Crete and Cilicia, and pirates would often sell their captives into slavery. This was not always the case. Strabo, writing about the northeastern Black Sea coast, says of the local population that they lived by robbery at sea. Their boats were slender, narrow, and light, holding only about 25 people, rarely as many as 30. The Greeks called them *kamarai* (11. 2. 12). Their cruellest practice was to wander on foot night and day looking for people to kidnap but "they readily offer to release their captives for ransom, informing their relatives after they have put out to sea" (Strabo, 11. 2. 12). In this part of the Pontus pirates would attack Greek cities.

The control of piracy is usually considered to have been one of the prime functions of the Roman garrisons established along the eastern coast of the Black Sea under the principate. In the middle of the 3rd century AD large bands of marauders from the Pontus would make their way into the Aegean, plundering both shores, penetrating as far south as the coast of Lycia and Pamphylia, and forcing their way inland as far as Cappadocia (Zosimus, 1. 28; Ammian Marcellinus, 31. 5. 15).

The authorities of Greece and of countries on the Black Sea tried to fight piracy to make the sea safe for voyagers and merchants. The king of the Bosporan kingdom, Eumelus (310/09–304/03 BC) "in order to protect those sailing through Pontus Euxinus ... waged war against the Heniochi, Tauri, and Achaei who were engaging in piracy and cleansed the sea of such pirates, for which he was praised not only in his own kingdom, but also throughout the universe, for traders everywhere spread the word about his determination" (Diodorus, 20. 25).

Piracy in the Black Sea was a matter of concern to the rulers of non-Pontic countries as well. Even Pericles was aware of these dangers, and it is possible that one of the reasons for his Pontic expedition was to protect Athenian interests and trade in the Black Sea from local pirates (Plutarch, *Pericles*, 50; Diodorus, 20. 25). An inscription (228–225 BC) from a temple wall in Samothrace gives us some details of Egyptian methods there: the *strategos* (commander) of the Hellespont and Thrace is thanked for the precautions taken to safeguard the island against marauders who regularly threatened to seize the temple treasures: a detachment of horse, foot, and catapult men had been dispatched to the island (*Sylloge Inscriptionum Graecarum*, 3. 502).

In the Archaic and Classical periods the aim of pirates had been to satisfy their own needs through plunder. Rulers had resisted this. In the Hellenistic period there was a gradual change in the nature of piracy: it became more concerned with supplying the demand for slaves throughout the Greek world. Rulers began to come to an accommodation with pirates and the slave trade became one of the sources of revenue for their states. From the 3rd/2nd centuries BC local rulers were no longer concerned about piracy. On the contrary: in the Pontus, for example, they colluded with them. As Strabo reports: "[Achaei, Zygi, and Heniochi] sailing sometimes against merchant vessels and sometimes against a country or even a city ... hold the mastery of the sea. And they are sometimes assisted even by those who hold the Bosporus, the latter supplying them with mooring places, with a marketplace, and with means of disposing of their booty" (11. 2. 12). At this time Tanais became a large and famous marketplace in the Bosporus, where slaves, hides, and other goods of the sort possessed by nomads were brought for exchange for clothing, wine, and other trappings of civilized life (Strabo, 11. 2. 3).

Piracy in the Byzantine and Ottoman periods continued to be a source of wealth and slaves. A distinctive feature of the Ottoman system was the formation of the Mamluks, Christian slaves taken as children and trained to form an elite military caste, who long ruled in Egypt and exerted considerable influence in Constantinople.

Piraeus

The Piraeus (in Greek: Peiraieus) is a rocky limestone peninsula situated at the northeastern end of the Saronic Gulf about 10 km southwest of the centre of Athens. Its chief features are the hill of Munychia (modern Kastella or Kastellon), which rises abruptly in the northeast, and Akte, a lower plateau that extends southwest towards the sea. According to Strabo (*Geography*, 1. 3. 18) Piraeus derives from *peran* meaning "opposite" because the peninsula was originally detached from the mainland. It possesses three harbours: from east to west these are Zea (modern Limen Zeas or Pasolimi), Munychia (modern Tourkolimani or latterly Mikrolimani), and Cantharus or Goblet (modern Kentrikos Limen). Cantharus was also known as Megas Limen or Great Harbour in antiquity. There is little archaeological evidence for any settlement that predates the 5th century BC. The region entered history in 510 BC when Munychia was fortified by the tyrant Hippias,

who intended to make it the seat of his government after being driven out of Athens ([Aristotle], *Constitution of Athens*, 19. 2).

The Piraeus became important in 483 BC when, on the initiative of the politician Themistocles, the Athenians voted to allocate the proceeds from a new strike at the silver mines of Laurium to finance the building of a fleet. At the same time work began on a fortification wall to safeguard the Piraeus against attack. Previously the sandy bay of Phalerum, which lies to the east and which is "the place where sea and city are nearest" (Pausanias, 1. 1. 2), had served as a roadstead for the Athenian navy, though it afforded little shelter. Thanks to Themistocles' initiative the Athenian fleet was able to play a decisive part in the defeat of the Persians in the straits of Salamis in 480 BC. Without the development of the Piraeus, Athens would never have acquired its maritime empire. Naval inventories reveal that in the 4th century BC Zea was the largest naval port with no fewer than 196 shipsheds, while the Great Harbour accommodated 94, and Munychia 82. The naval headquarters are likely to have been concentrated in the Great Harbour.

The fortification of the Piraeus was also destined to have profound consequences for its political development since it was the *thetes*, the lowest property-holding group, who served as rowers and who, when Athens became dependent on its sea power, came to acquire a leading position in foreign-policy decisions. From this evolved the intimate association between democracy and the Piraeus, whose population, in Aristotle's phrase, was "more democratic" than that of Athens (*Politics*, 5. 1303b10–12). As an administrative unit the deme of Piraeus was "a law unto itself" (Whitehead 1986, p.122). One of the clearest indications of its anomalous nature is the fact that its demarch was appointed by lot by the entire citizen body of Athens, whereas all other demarchs were appointed by their demes.

In 458/57 BC the city of Athens became linked to the Piraeus by the construction of two diverging long walls that incorporated the Piraeus and Phalerum. This wedge-shaped area could now be sealed off from the rest of Attica in time of war. Shortly afterwards a middle wall, known as the southern Long Wall, was built parallel to the western one, thereby eliminating the bay of Phalerum. Around the middle of the 5th century BC, and probably at Pericles' suggestion, the town planner Hippodamus of Miletus was invited to "cut up the Piraeus" (Aristotle, *Politics*, 2. 1267b23), which he did according to a grid pattern.

The Piraeus now began to develop as an urban entity that came to rival Athens in size. It also became the leading commercial port in the eastern Mediterranean. Since Athens was now very largely dependent on imported corn, the commercial quarter, which was known as the Emporion, was vital to its survival. The Emporion was situated along the eastern and northern shorelines of the Great Harbour. In 431 BC Pericles could boast with justification that "all the produce of every land comes to Athens" (Thucydides, 2. 38). A duty of 2 per cent was levied on all cargoes passing through the Emporion. We receive some indication of the volume of goods that it handled from the fact that in 399 BC, when trade can have barely recovered from the crippling effects of the Peloponnesian War, the state collected 1,800 talents in harbour dues.

The Piraeus was home for a very large number of metics who came from all over the Greek world and beyond. Their presence, which is evident from a variety of foreign cults established around the port, must have lent it a very cosmopolitan flavour. Among the most prominent of these cults was that of the Thracian goddess Bendis, situated on Munychia (Plato, *Republic*, 1. 327a). Others include the Egyptian gods Isis and Sarapis, and the Phoenician Baal. It was here, too, that the cult of the healing god Asclepius was first introduced into Attica around 420 BC. According to Pausanias the most notable sight in the Piraeus was the Diisoterion or shrine of Zeus Soter and Athena Soteira (1. 1. 3).

Like any thriving port, the Piraeus possessed its sleazy underworld. Aristophanes' description of the spectacle of a man defecating in a brothel, as observed by Trygaeus as he flies over the Piraeus, was evidently intended to convey the distinctive flavour of the region (*Peace*, 164f.). Though many prosperous Athenians and metics lived in the Piraeus, given the size of its population, it is plausible to suppose that it also contained a large number of multiple dwellings or *synoikiai*, the ancient Greek equivalent of the modern tenement.

The Piraeus was critical to Athenian strategy during the Peloponnesian War when, on Pericles' advice, the decision was taken to abandon the countryside of Attica, turn Athens into an island, and coop up the entire population within the fortified area of Athens, the Long Walls, and the Piraeus. This led to a very severe outbreak of the plague, which reduced Athens' population by perhaps as much as one-third. The peace terms to which Athens agreed at the end of the war required the destruction of the Long Walls and the Piraeus circuit (404 BC). The Piraeus subsequently played a leading part in resistance to the Spartan-backed Thirty Tyrants when exiles under the command of Thrasybulus seized Munychia and drove out the Thirty.

The circuit walls and shipsheds were rebuilt by the Athenian general Conon in 393 BC. Before long the Piraeus resumed its importance as a naval and commercial port of first-rank significance. In the middle of the 5th century BC it was able to accommodate more than 350 triremes. In 330 BC Philon's so-called Arsenal was built in Zea, described by Pliny (*Historia Naturalis*, 7. 37. 135) as one of the most admired buildings of antiquity. This was not an arsenal as such but a warehouse for the storage of the sails, oars, and tackle that were removed from triremes when they were at berth. No traces of the building remain and it can be reconstructed only from the precise specifications that are preserved in an inscription authorizing the work to be undertaken. Ironically, within a decade of its completion, Athens had suffered a defeat at the hands of the Macedonians that eclipsed its naval power for ever.

Under Macedonian domination (322–229 BC) the garrison on Munychia Hill became one of the four "fetters of Greece". The Piraeus now began to decline steadily in size and importance. In the 2nd century BC it served as a Roman base for naval operations against the Macedonians. Lacking the glamour that attached to the name of Athens, the Piraeus never attracted royal patronage in the Hellenistic era. The only evidence of building activity is the impressive and well-preserved theatre overlooking Zea Port, which was

constructed around the middle of the 2nd century BC. In around 120 BC several major festivals were revived and celebrated on a grandiose scale, notably the Diisoteria and Munychia, whose festivities incorporated nautical manoeuvres performed by ephebes.

In 86 BC the Piraeus was ruthlessly destroyed by the Roman general Sulla who spared "neither Philon's Arsenal nor the docks nor any of its other famous architectural works" (Appian, *Mithridatic Wars*, 41). One of the few buildings to escape destruction was the Diisoterion, though all traces of the shrine have since disappeared. A number of important bronze statues, including those of *Apollo*, *Artemis*, and *Athena*, which were deliberately buried at this time, came to light in 1959. Though it continued to function as a port, notably for the flourishing trade in neo-Attic sculpture that the Roman market demanded, the Piraeus never recovered its importance in antiquity. When Pausanias visited it in the 2nd century AD, very few buildings of note were standing. In 1040 Harald Hardraade, who later became the king of Norway, captured the port on behalf of the Byzantine emperor. In the Middle Ages it was merely a fishing village.

When Athens became the capital of Greece at the end of the Greek War of Independence, the ancient name of Piraeus had been forgotten. The port was then known as Porto Leone, after the figure of a lion that had been removed by the Venetians in 1687. It was now renamed, and from 1835 onwards it came to be furnished with quays and other modern harbour facilities. It also acquired many impressive Neoclassical buildings, though sadly many have either been destroyed or are in disrepair. In 1923, following the destruction of Smyrna, more than 100,000 Greek refugees fled to the Piraeus from Turkey. In World War II the port was destroyed by German bombs. It was subsequently rebuilt with US aid.

Today the Piraeus is the largest port in the eastern Mediterranean. More than half the country's imports and exports pass through it. It is also Greece's third largest city with a population of close to 200,000. The Kentrikos Limen functions as both a commercial and a passenger port, whereas Mikrolimani and Pasolimani handle only yachts. Many major industries, notably engineering, cigarettes, paper, textiles, and chemicals, are situated on the outskirts of the city. The Piraeus is also the headquarters for the Greek navy and an important fishing centre. Thanks to railway and road connections, it is once again closely linked to Athens.

The only traces of the ancient city that are visible today include portions of the 4th-century BC circuit wall, the theatre at Zea, some shipsheds, and the restored tomb of Themistocles on the promontory of Alkimos. Virtually all that remains of the Hippodamian layout is confined to a series of boundary markers, though the modern street plan follows the course of its ancient predecessor.

Summary

The port of Athens, Piraeus possesses three harbours. It was fortified in 483 BC when Athens began to build a fleet. In 458/57 BC it was linked to Athens by the Long Walls. In the mid-5th century BC the city was planned by Hippodamus of Miletus. The harbour could accommodate 350 triremes. Piraeus declined in the Macedonian period and was destroyed by the Romans in 86 BC. Its importance returned in the 19th century.

Pisistratus

Tyrant of Athens in the 6th century BC

Solon's reforms had (perhaps inevitably) left none of the contending parties completely satisfied. He himself had proudly proclaimed that he was taking up his position "amidships" in the ship of state, i.e. that he would not go to either extreme, satisfying neither the demands being made by those without property that the ancestral land of Attica be redivided so that all would literally have a portion of it, nor the insistence of the aristocrats that the running of the city's affairs should be left entirely in their hands: "to each side what it deserved". The years 590/89 and 586/85 BC were designated in the official records as (literally) "anarchic", because no chief magistrate had been elected, due to internal dissension. In 582/81 BC an otherwise unknown individual named Damasias attempted to hold on to the archonship for an illegal period beyond his official tenure, and there are indications of an experiment with some kind of block election of archons by social and economic grouping. With continuing unrest of this kind, it was only a matter of time before some opportunist succumbed to the temptation that Solon himself said that he had been strong enough to resist, of initiating a coup d'état and taking all power effectively into his own hands. (This had already happened in many other Greek states in the preceding two generations, and for a man in such a role the Greeks themselves had borrowed, possibly from the Lydians, the term "tyrant".)

The later tradition remembered, and even thought it had evidence, that Solon himself both foresaw and tried to warn the Athenians of an impending coup by his kinsman (and, the gossipers said, former lover), Pisistratus. The men were related on the side of their mothers, both tracing their descent from an early king, Codrus, and thus from a junior branch of the royal house of Pylos. What can safely be asserted is that the remains of Solon's poems have a scattering of dark hints that, if civil unrest should continue, Solon himself envisaged that an unscrupulous would-be autocrat would emerge to try to respond to the people's demands; but in what survives of his work Solon nowhere mentions Pisistratus by name; nor does it seem likely that he would have overlapped with Pisistratus' early, tentative gropings for power by more than a year or two.

Our earliest and fullest account of Pisistratus' coup comes from Herodotus (the chronology for the early Pisistratean period is uncertain, but we are in the late 560s BC). What gave Pisistratus his chance was the fact that the city was beset by factional strife, the "Men of the Shore" being led by Megacles, son of Alcmaeon (Megacles had married into the "tyrant" family of Sicyon), and the "Men of the Plain" by a certain Lycurgus. Pisistratus organized his own followers under the title "Men from beyond [or "across"] the Hills". Attempts have been made to discover here a classification beyond the merely geographical, perhaps according to some division along ideological or economic lines, but no suggestion has been entirely convincing. It seems most probable that the names were chosen to give a rough indication of where the leaders lived and where they derived their support. Herodotus' flair for the dramatic may be leading him astray, but what he reports is that Pisistratus staged an attack on himself by his enemies, even going so far as to wound himself and claim that his enemies had done it. He reminded the Athenians of his services to them in earlier hostilities against Megara, and asked for a bodyguard. Thus reinforced, he established himself in power on the Acropolis, where the Athenian kings had resided in the Mycenaean period. His opponents put aside their squabbling and joined forces to drive him out, but Pisistratus was able to outmanoeuvre them by entering into a marriage alliance with Megacles. The alliance, like the marriage that was its surety, proved shortlived, and Pisistratus once again went into exile, this time for a ten-year period (on the likeliest chronology, *c.*557–547 BC). He took the opportunity to make sure that he had the resources, financial and in manpower, to gain a secure grip on power. He turned to northern Greece, founding a colony on the Thermaic gulf and exploiting sources of silver near Mount Pangaeus; with this wealth (perhaps converted into a personal coinage) he hired mercenaries and called for additional support from Thebes, Argos, and the island of Naxos. Pisistratus and his troops landed near Marathon, near his family holdings and original power base in Attica at Brauron, and marched on Athens, to good omens and, if not exactly token opposition, at least a resistance that was only half-hearted; his sons were able to reassure the Athenians of their father's good intentions. To all but the disgruntled leaders of the aristocratic faction and their immediate coteries it must have appeared that a period of stability, no matter whose hand was at the tiller, was far preferable to the almost half-century of turmoil and the politics marked by family rivalries that had preceded it.

Greek writers of later periods invariably looked back on a time of autocracy as distasteful; the personal performances as well as the character of these early tyrants tended to be blackened, their shortcomings if not invented then considerably exaggerated and turned into bizarre perversions and even crimes. It is all the more surprising, therefore, that in our major sources Pisistratus comes off with a relatively clean record. Herodotus comments that Pisistratus ruled "without disturbing the previously existing offices or altering any of the laws; he administered the state according to the established usages and his arrangements were wise and salutary". Of course there was no office of "tyrant", nor do we have any indication that he assumed an actual title, such as "Protector of the Constitution", but Thucydides reports that he "took care to see that one of his own men was in the archonship". The writer of the *Constitution of Athens* remarks: "his rule was more like a constitutional government than a tyranny".

Pisistratus may have started as just another faction leader, but he seems to have grown in his rule. He took particular care to introduce measures that would perhaps not unify Attica in a literal sense (a role that political myth assigned to Theseus), but would at least make residents of outlying districts of the city itself feel loyalty to Athens as an integrated political entity. One especially strong weapon he had was that the religious cults tended to be situated locally and were invariably organized by the aristocratic families of the particular area. Archaeological and other evidence indicates that Pisistratus sponsored new or revitalized cults that broke down these local and class barriers and fostered a sense of unity. Thus at neighbouring Eleusis, where people of every class (including slaves) could be inititiated into the mysteries of Demeter, which promised some kind of personal survival after death, a new *telesterion* or initiation house was built, and a shrine to Demeter was established in the city itself as a kind of district office of the cult. The career of the poet-dramatist Thespis (himself a somewhat legendary figure) was launched at Athens in the 530s BC, and it is possible that from this date there were regular performances there of some kind of proto-tragedy in honour of Dionysus. Probably another shrine to Dionysus, the Lenaion, was built in the Agora during this period. There were also various new cults of the god Apollo with separate cult titles (Hypoakraios on the west slope of the Acropolis, Patroos on the west side of the Agora), and one in particular, Apollo Pythios, appears to have been designed to compete with Delphi, with which Pisistratus was on rather cool terms. Pisistratus undertook a ritual purification of Apollo's sacred island of Delos (by removing graves, making sacrifices etc.) immediately upon his final, firm assumption of power. This should probably be seen as an attempt to shift people's attention away from Delphi, and is an anticipation of the centrality of Delos in Athenian imperial propaganda a century later.

There is no concord among archaeologists as to specifics, but most agree that an ambitious building programme was undertaken on the Acropolis. There was a large temple to the city's patron goddess, Athena (variously styled the "Hekatompedon" or Athena's "Old Temple"), and architectural sculpture survives – including the lively and amusing sea monster dubbed "Bluebird" in the Acropolis museum – that suggests that there are other "shrines" on a more modest scale. There was also a temple to Athena Nike, the "Bringer of Victory", at the west end of the Acropolis, on the site where a later temple greets today's visitors to the precinct. Nor were sacred structures the only ones in this building scheme (whether by Pisistratus or his sons – it is often difficult to be sure that the remains predate Pisistratus' death in 528 BC). A fountain house named Enneakrounos, "Nine Spouts", was built southeast of the Agora to bring fresh water down from the hills northeast of the city, guaranteeing an efficient and orderly water supply for the residents of Athens. The name of Pisistratus' son Hipparchus is associated with an improvement in the road system connecting the central city, specifically the Altar of the Twelve Gods in the Agora which Hipparchus is said to have dedicated, with the outlying districts. Hipparchus was also remembered as an artistic entrepreneur; he is said to

have invited the poets Anacreon and Simonides to take up residence in Athens, and to have been responsible for collecting manuscripts of Homer's epics, perhaps as some kind of official text for competitions at the Panathenaic festival, which was probably not founded by Pisistratus, but may have been expanded under his patronage.

The Athenians were thus encouraged to be proud of their city and to visit it, if they lived in the countryside, as often as possible. Realistically, however, a rural Athenian spent most of his or her time on the family farm in the 6th century BC, even as later in the 5th century BC. Sculptors and artisans might be based in the city itself, and the upsurge in exports of fine black-figure Attic pottery suggests a thriving industry of production and export, but Pisistratus seems also to have taken to heart the plight of the Athenian farmer. He is reported to have made loans to the poor so that they could make a living by farming (but he also charged a land tax of 5 or 10 per cent), and he set up a system of circuit judges who travelled the Attic countryside and settled legal disputes. As already noted, Pisistratus appears to have been careful in his observance of the forms of Athenian civic life, and, if a story told by the *Constitution of Athens* can be believed, he once even came before the Areopagus court to answer a charge of homicide; we are told that the plaintiff, perhaps not surprisingly, failed to appear. His rule was later remembered as a golden age, the "age of Cronus" (in contradistinction to the rather harsher Olympian rule of Cronus' son and successor, Zeus). There is probably a good deal of truth to this, although the foreshortening of time and dimming of collective memory may have done something to enhance his reputation with later generations of Athenians.

The evidence of his dealings with the other aristocrats is somewhat ambiguous. The Alcmaeonidae, Megacles' family, chose to play the role of martyrs. When Pisistratus died (probably 528 BC), there was no rush to substitute a different form of government or damn his memory, as happened with other Greek tyrannies; his eldest sons, Hippias and Hipparchus, may have been worried about possible competitors to succeed Pisistratus, and Herodotus reports that they had arranged for the assassination of the elder Cimon, who had won multiple victories in the Olympic Games and so might have appeared as a plausible contender for supreme power. What appears to have been the sons' preferred tactic of neutralizing opposition, however, was diplomacy and cooption. There is inscriptional evidence that in the years immediately after Pisistratus' death the chief archonship was held by his son Hippias (526 BC), Cleisthenes the Alcmaeonid, the later lawgiver (525 BC), Miltiades, future victor at Marathon (524 BC), and the younger Pisistratus, the tyrant's grandson (523 BC).

The family's control of Athenian government finally came to an end in 510 BC after a period of turmoil. An assassination attempt in 514 BC was only partly successful: the tyrant Hippias' younger brother Hipparchus was killed though Hippias himself escaped. The sources uniformly report that the Pisistratids' rule (to give the family the name by which ancient writers refer to them) became much harsher. The aristocrats saw an opportunity to dislodge the family that had held the dominant position at Athens for 36 years, but this was managed only after several failed attempts, and with the assistance of some formidable propaganda from the Delphic oracle as well as an armed invading force led by a Spartan king.

Pisistratus' reign was crucial to the development of Athenian democracy. Under Pisistratus Athens' leading and ever-contentious families were either exiled or reduced to political impotence. If he had tampered with the Solonian institutions, much (though perhaps not all) would have been lost; Cleisthenes in 508 BC would have had to start, so to speak, from scratch. As it was, the Athenians were given a tantalizing taste of the fruits of political stability and peace (no foreign engagements of any consequence are recorded for the period of Pisistratus' rule, and it is a continuing puzzle whether he even maintained a standing army and navy). Athenian manufacture and trade flourished, and the fruits of this increased prosperity went to enhance life in both city and countryside. Local workers and craftsmen were given employment, and designers and artists were imported from the more artistically advanced regions of the Near East, such as Ionia. Athenians came to see that the advancement of Athens' interests was best viewed as a community enterprise and that, as their city prospered, so did their own individual circumstances. A century later, under Pericles, Athenians of all stripes and classes were to discover how advantageous a full public treasury could be.

Biography

Born in the early 6th century BC, Pisistratus first seized power in Athens in the 560s BC. After a ten-year exile (*c.*557–547) in Macedonia, he returned to Athens in 546 and established a tyranny. The city flourished and the period of his rule was remembered as a golden age. He died *c.*528 BC and was succeeded by his sons Hippias and Hipparchus.

Plants

Greece is a very diverse country, with high mountains and a varied climate. Like other Mediterranean countries, it escaped the worst ravages of the ice ages. Its flora is the richest in Europe after Spain's. Most of the plants do their growing in the winter or spring, and are dormant through the harsh dry summers.

Typical Mediterranean vegetation is supposed to be dominated by evergreen trees such as prickly oak, phillyrea, and arbutus. These are very adaptable: they exist in either a tree or a shrub form according to the degree of browsing, burning, and woodcutting, and can change from one to the other (see the article on Landscape). However, in less arid places, deciduous oaks and other deciduous trees are prevalent and increasing. There are also conifers, such as Aleppo pine, mountain fir, and Cretan cypress. The aromatic, sticky, and spiny plants of dry hillsides – cistus, thyme, Jerusalem sage – are undershrubs, which cannot turn into trees. There are innumerable grasses, annual and perennial legumes, and orchids. Colourful weeds of cultivation, such as wild gladiolus, now rarely seen in the rest of Europe, frequent old-fashioned olive groves.

Nearly all crop plants in Greece, except the olive, are introduced rather than indigenous. Cereals, vines, legumes, and some vegetables were familiar to the ancient Greeks, but many other crop plants have been introduced from other continents. Greek agriculture and cuisine were transformed by the introduction from the Americas of plants such as tomato, potato, maize, tobacco, and most beans. Although most wild plants were known to the ancients, some weeds have been brought in along with exotic crops. The yellow *Oxalis pes-caprae*, now one of the commonest plants, arrived from South Africa a little over a century ago. Irrigated cultivation has produced a universal set of tropical, weedkiller-resistant weeds.

Many Greek plants are generically Mediterranean: Aleppo pine is found almost everywhere from Spain eastwards, except in Crete. Most evergreen trees and shrubs and grey-green undershrubs also prevail in other Mediterranean countries, though the species may differ. However, Greek vegetation has its own peculiar character. The common evergreen oak is the prickly oak, *Quercus coccifera*, not holm oak or cork oak as in other countries. One of the common deciduous oaks is *Quercus macrolepis*, whose huge acorn-cups were exported for tanning leather.

Many species are restricted to particular altitudes. Mediterranean plant communities tend to form zones at various heights above sea level, with deciduous oakwoods predominating in the lower mountains, fir- and pinewoods above these, and special alpine plants above the tree line. This zonation, however, is relatively weak in Greece, and in Crete there are really only two zones: the alpine desert and the rest.

Greece has outliers of Central European vegetation, extending southwards in the mountains. Beechwoods, for example, extend in the Pindus mountains well within modern Greece; they are accompanied by wild strawberry and even primrose.

Endemic plants are those found nowhere else but Greece. Some are common: the Greek fir tree, abundant in the mountains to within sight of Athens, is peculiar to Greece. Many others are confined to a particular mountain or group of mountains: Macedonia is particularly rich in them.

Crete is a miniature continent with high mountains, deserts, and jungles, and a profusion of cliffs and gorges. Some Greek plants, such as Aleppo pine, do not extend to Crete, and the island has many species of Asian rather than European affinities, with a few African. In misty ravines in the western mountains are royal fern and bog pimpernel, more characteristic of cool damp Ireland; not far away are spiny shrubs outlying from the Sahara. Crete also has the largest concentration of endemic plants in Europe. Cliffs, gorges, and the alpine desert are full of strange specialized plants. Others, often of arresting beauty, are common and conspicuous.

Examples of Cretan plants are cypress, an Asian tree native nowhere else in Europe; Cretan pine, which is also Asian and different from Greek pines; *Origanum dictamnus*, a Cretan endemic famous since antiquity as a medicinal herb, still common in the gorges; *Ebenus cretica*, one of the most beautiful plants in Europe, common in Crete and found nowhere else; the glorious blue *Petromarula pinnata*, an endemic on cliffs and Venetian walls; and *Hyoscyamus aureus*, golden henbane, common on the city walls of Herakleion (where it has been for at least 400 years), its only European locality.

Greek plants are at their best between March and May, when the annuals, the wonderful bulbs, and the many species of orchids are in bloom. Later in the year visitors should explore the high mountains.

Planudes, Maximos *c.*1255–*c.*1305

Scholar and translator

Typical of the best Byzantine polymaths, Planudes's range of scholarly activities paralleled the traditional disciplines of the Byzantine educational curriculum. He wrote not only treatises on grammar, rhetoric, and the correct usage of vocabulary but also commentaries on and texts of literary, rhetorical, mathematical, and astronomical works, as well as original rhetorical

pieces exemplifying good prose style. As director of a school in Constantinople, he energetically provided texts and treatises for his students, who included scions of prominent families and some nascent scholars or public officials. Planudes's interests and energies, however, transcended the needs of a school curriculum.

Planudes extended the scientific knowledge of his time through his activity with texts. With the help of the patriarch of Alexandria and of the emperor Andronikos II Palaiologos (1282–1328), he obtained a text of Ptolemy's *Geography*, then reconstructed its missing maps himself. He copied out Aratus' *Phaenomena*, which was regularly used as an astronomical textbook, and also used Ptolemy to correct its factual information, neatly excising the obsolete sections of Aratus and substituting passages in the same style and metre. Although Planudes violated the integrity of the original, he maintained and enhanced its literary quality and scientific purpose.

Planudes extended traditional literary studies beyond the mere copying and annotation of Classical authors. He collated different manuscripts of the same text and attempted to make emendations, thus producing a modest critical edition in the modern sense of the word. He and his younger associate Demetrios Triklinios are regarded as "the latest Byzantines whose activities had any lasting effect on classical texts" (Reynolds and Wilson, p. 77). Planudes also searched out rare but interesting literary texts. He selected, adapted for school use, and copied in his own hand an anthology of epigrams, systematically arranging and subdividing them. This collection, which was frequently recopied, was the only one to preserve the so-called *Greek Anthology* until the larger *Palatine Anthology* was discovered in the 19th century (380 epigrams still survive only in Planudes's anthology). He confided in a letter that he was undertaking the task of producing a complete collection of Plutarch's writings "because, as you know, I am completely devoted to the man" (Letter 106). This massive task would not be completed by Planudes's associates until after his death, when the last section of the *Moralia* was finally located and copied. His circle reintroduced nine plays of Euripides that had been omitted from the traditional school curriculum and were preserved in a single manuscript, now lost (this contained part of the entire works of Euripides in alphabetical order; the plays we owe to this circle are *Helen*, *Electra*, *Heraclidae*, *Heracles*, *Suppliant Women*, *Iphigenia at Aulis*, *Iphigenia among the Taurians*, *Ion*, and *Cyclops*). Although the discovery of this manuscript has been credited to Dimitrios Triklinios in Thessalonica, new evidence suggests that Planudes may have been responsible for finding it.

Planudes advanced the development of arithmetic and geometry by editing texts and by adapting an earlier anonymous essay (1252) on Indian calculation. His adaptation improved the process of extracting square roots, contained the first use of zero as a place holder in Byzantine arithmetic, and demonstrated Persian scholarly influence through the use of eastern Arabic number forms. (His source used western Arabic forms.) He annotated Euclid's *Elements* and also collated an edition and produced a commentary for Diophantes's *Arithmetic*, a notoriously difficult work studied by advanced mathematicians among Planudes's contemporaries. His edition improved the text of Diophantes and his commentary provided explication of some vexed problems more clearly than Diophantes's original. The recent discovery that Byzantine scholars in the circle around Planudes accomplished a vast recension of astronomical and mathematical texts sometime after 1296 suggests that he participated in an effort so significant that manuscripts owned by Bessarion in the 15th century were influenced by it.

In his broad literary and scientific interests, Planudes exemplifies the late Byzantine polymath. In his commitment to translating Latin literary works into Greek, however, he was extremely unusual and perhaps even unique in his time.

Some of Planudes's translations figured in the religious and political controversies surrounding the union of the Eastern and Western Churches. His translation of Augustine's 15-book philosophical treatise *On the Trinity* drew criticism from both parties. In 1305 an anonymous Dominican in Constantinople labelled the work "not a translation but a falsification"; in the 15th century the anti-unionist patriarch Gennadios I Scholarios complained that Planudes's translation failed to clarify the nature of the procession of the Holy Spirit, while Cardinal Bessarion, a fervent supporter of ecclesiastical union, warmly commended him as a translator. Planudes also translated "one of the most read books of the Middle Ages" (Schmitt, p. 132), the anonymous theological treatise *On the Misdeeds of the Age*, erroneously attributed to both Cyprian and Augustine.

The translation of Latin theological writings into Greek involved the risk that he would raise suspicions of anti-Orthodox sympathies. Was it to counter such suspicions that Planudes became a monk? Curiously, the only other Byzantine of this period who may have translated Latin literary works into Greek was also a monk, Manuel Holobolos, an Aristotle scholar and teacher in the Patriarchal Academy under Michael VIII. The Greek translations of two rhetorical works by Boethius, *On Various Topoi* and *On the Hypothetical Syllogism*, are attributed in manuscripts both to Planudes and to his less famous senior colleague. Only stylistic analysis and comparison can determine which scholar produced these translations, probably the first from Latin literature in 13th-century Constantinople.

Whatever Planudes's reasons for becoming a monk, the volume and variety of his translations from Latin indicate that his activities as a translator extended throughout his scholarly career. Some of these translations served pedagogical purposes. He translated part of Priscian's *Grammatical Instruction* in his own essay *On the Syntax of Parts of Speech*, and he selected and translated aphorisms from the *Sayings of Cato*, a collection preserved in numerous manuscripts and cited in the 14th-century novel *Imberios and Margarone* and in Emmanuel Georgillas's 15th-century poem, *The Plague of Rhodes*. Planudes may also be the anonymous Byzantine translator of the pseudo-Aristotle's *On Plants*, a work that survived only in Latin.

Planudes's remaining translations from Latin were purely literary in their appeal – Boethius' *Consolation of Philosophy* with a *Life of Boethius* appended, Cicero's *Dream of Scipio* with Macrobius' *Commentary*, Ovid's *Heroides*, his *Metamorphoses*, and perhaps a selection from his *Amores* as well as four lines of Juvenal's *Satires*. Except for the metrical translations of Juvenal and of the *Sayings of Cato*, these are prose paraphrases, embellished with rhetorical figures and

preserving a slightly foreign flavour in diction. They were extremely popular among early western humanists, who used them as aids to learning Greek; Petrarch, for instance, owned a copy of the Cicero / Macrobius translation with marginal references to the Latin text, and in the 15th century Ambrogio Traversari reported reading both Latin and Greek versions of Boethius' *Consolation*.

The works translated by Planudes represented staples of a good Latin library. Planudes may have encountered educated Latins conversant with these works and a library containing them in the Franciscan and Dominican friaries that probably operated in Constantinople during the Latin occupation. He acquired both his knowledge of Latin and the texts he translated in the east, for he had mostly completed his translations by 1296, when he made his only visit to the west.

Planudes's translations from Latin endorsed the value of this foreign tradition for cultured Greek readers. An interest in Latin literature as evidenced by translations had faded at Constantinople until its revival during the early Palaiologan period, which also valued Arabic and Persian science and literature. Translation then languished until the mid-14th century, when the controversy over ecclesiastical union prompted such scholars as Demetrios and Prochoros Kydones, Manuel Kalekas, and George Scholarios to translate Latin theological writings. In this period Planudes was credited with translations of works by Caesar, Cicero, pseudo-Donatus, Augustine, Thomas Aquinas, Petrus Hispanus, Hilarius, and Macrobius. These false attributions, still quoted in the scholarly literature, provide eloquent if flawed testimony to the enduring fame as a translator that the Byzantine polymath Planudes achieved.

Biography

Born *c.*1255 in Nicomedia and baptized with the name Manuel, Planudes worked as a scribe in the imperial palace from 1283. On becoming a monk, he took the name Maximos and, though abbot of the monastery at Mount Auxentios, he remained in Constantinople. His pupils included Manuel Moschopoulos and George Lekapenos. In 1296 he visited Venice on an imperial embassy. He translated many Latin authors and made important contributions to Greek scholarship. He died *c.*1305.

Plastiras, Nikolaos 1883–1953

Politician

Nikolaos Plastiras played a leading role in the events of the revolution of 1922, and, serving on several occasions as premier during the post-World War II era, upheld the democratic principles of his country.

As a young man, Plastiras lived in Karditsa in central Greece. When he completed his schooling, he enlisted in the Greek national army (1903) and, as a commissioned officer, participated in the Macedonian struggle of 1905. Before the outbreak of the First Balkan War (4 October 1912), Plastiras was admitted to the cadet school (1910–12), graduating with the rank of second lieutenant. During the Balkan Wars Plastiras showed great courage and leadership in the battlefield and was highly respected by his fellow officers and his superiors.

At the outbreak of World War I, Plastiras had already been promoted to the rank of lieutenant. The political and ideological friction between King Constantine I and Eleftherios Venizelos led to a division in both the political and the military ranks. The Venizelists believed that Greece should enter the war on the side of the Allies, while the Royalists supported a more neutral stance, hoping to avoid armed opposition against Germany. In September 1916 Plastiras joined the supporters of Venizelos and assumed the command of one of the battalions of the 6th regiment of the Archipelagos division. While commanding his battalion, Plastiras participated in the military operations on the Macedonian front, and proved once again his leadership and valour. He was promoted to lieutenant colonel in 1919 and given the command of the 5/24 regiment which fought in the Ukrainian campaign against the Bolsheviks, showing the same qualities that he had exhibited during the Balkan Wars. After the end of this campaign, and with the rank of colonel, Plastiras was reassigned to Asia

Minor, where the campaign against the Ottoman empire was under way.

In Asia Minor Plastiras was recognized for his contributions in every phase of the military campaign, especially the period 1921–22, when the Greek forces, having overextended their supply lines, came under heavy fire from the troops of Mustafa Kemal and the Turkish nationalists. During that period Plastiras conducted an orderly retreat, supporting the general exodus of the Greeks from Asia Minor. Plastiras remained on the coast of Asia Minor and was a witness to the disaster of Hellenism in Ionia. Immediately after the humiliating defeat in Asia Minor, Plastiras, in collaboration with colonel S. Gonatas and captain D. Phokas, succeeded in forcing king Constantine I to flee by instigating a coup. As a member of the powerful triumvirate that ruled Greece, Plastiras played a leading role in the political developments and financial difficulties that Greece had to face following the influx of refugees from Asia Minor. He assumed responsibility for the verdict that was passed on the six high-ranking personnel who were accused of being responsible for the Asia Minor disaster, and worked diligently for the rapid reformation of the Greek national army. Plastiras also made every effort to tackle the socioeconomic problems created by the inflow of the refugees. After the elections of 22 November, when Gonatas assumed the presidency, Plastiras continued to play a key role in political decision-making. He supported the negotiations in Lausanne, and was responsible for the final ratification of the decisions of the Greek delegation which led to the signing of the agreement in July 1923.

Exhausted by the events of the past several years, Plastiras withdrew from the political scene. However, a few months later, in October 1923, as a result of the movement of general P. Gargalidis and general G. Leonardopoulos, Plastiras once again became fully involved in politics in the effort to stop the Royalists from returning to power. Although successful in preventing another dictatorial government from taking over, Plastiras realized the importance and necessity of a return to parliamentary democracy. He called for elections, which were promptly held in December 1923, and shortly thereafter, despite his popularity, he quietly withdrew from the political foreground.

A decade later, and anxious about the future of his country's national identity, Plastiras perceived as a major threat the anti-Venizelist government that was voted into office following the elections of 5 March 1933. He acted decisively against the new government by instigating a military coup. The failed coup was criticized by the public and by Venizelos himself, and Plastiras went into voluntary exile in Paris until 1935. That year, however, the Royalist cause had gathered sufficient momentum to secure the return of the king, despite the efforts of the Venizelists in support of parliamentary democracy. This effort reached its pinnacle with the institution of the Metaxas dictatorship in 1936. In exile Plastiras maintained a very distant and at times hostile stance to the Metaxas regime, and did not return to Greece until after the end of World War II. However, he continued to be politically active and was a strong supporter of the National Democratic Hellenic Union (EDES).

World War II devastated the socioeconomic foundations of Greece. The tragedy continued as liberated Greece fell under the shroud of a brutal civil war. Archbishop Damaskinos and the British government recalled Plastiras to Greece, inviting him to assume the premiership in place of George Papandreou. During his shortlived first period in political office (3 January–8 April 1945) Plastiras succeeded in bringing the National Liberation Front (EAM) to the negotiating table in Varkiza to reach a peace agreement. An adamant supporter of peaceful solutions, Plastiras always spoke out against the violence of the civil war and campaigned strongly for a cessation of hostilities.

The conclusion of the civil war brought hope of a new beginning in rebuilding the devastated nation. In this optimistic environment Plastiras returned to the political foreground by creating the National Progressive Centre Party (EPEK). In the elections of 5 March 1950 his party secured 45 seats, winning 16.4 per cent of the popular vote. Shortly thereafter Plastiras entered a coalition with Sophokles Venizelos and George Papandreou in order to strengthen his government and initiate a campaign of national unity, essential for the future of Greece. The desire which Plastiras expressed to breach the social gap resulting from the civil war came under increasing scrutiny by the parliamentary opposition. He was criticized by members of his own coalition government and less than six months after his assumption of the premiership Plastiras was forced to resign. Despite personal attacks, Plastiras was returned to power in the elections of 9 September 1951, when he won 23.5 per cent of the popular vote and increased his party's representation in parliament by 29 seats.

Once again his political career was short-lived. Now 68, weary, and ailing, Plastiras was no longer capable of defending his political beliefs. On 16 November 1952 Alexandros Papagos and the Greek Rally Party defeated EPEK, forcing Plastiras to resign. He died a few months later on 26 July 1953, having valiantly represented his country and upheld his moral values in both the political and the military sphere at transitional and crucial moments of Greek hisrory.

City in Boeotia, site of a battle in 479 BC

Plataea was a city of southern Boeotia situated in the plain between Mount Cithaeron and the Asopus river. As the result

of an attempt by Thebes to force it into the Boeotian Confederacy, the city joined an alliance with Athens in 519 BC. It subsequently provided support to the Athenians against the Persians at Marathon (490), Artemesium, and Salamis (480), before being sacked by the Persians in 479.

After the Greek victory over the Persian fleet in the bay of Salamis and Xerxes' subsequent withdrawal, the Greek forces still had to confront a substantial Persian army under the command of Mardonius. Plataea became the site of the great final battle between the Persian forces and the assembled Greek resistance in 479. The Greek victory ended the threat of Persian domination of Greece.

Mardonius, who had retired to Attica after Salamis, moved his forces to the plains of Boeotia, probably to provide more favourable terrain for his cavalry. The Peloponnesian forces, which had assembled at the isthmus, marched first to Eleusis where they were joined by the Athenians under Aristides, and then moved across the Cithaeron range along the main road and the pass of Eleutherae (Gyphtokastro).

Perhaps before engaging the Persians, the Greek allies swore the "Oath of Plataea", a pledge to fight to the death against the Persians, remain loyal to one's allies, and not rebuild the temples destroyed by the Persians. Denounced even in antiquity as a forgery (Theopompus, *FGrH* 115 F 153), scholars still debate its authenticity and its location and date of swearing.

At the battle the Spartan regent, Pausanias, led the Greek forces to victory against a numerically superior Persian foe. Herodotus' estimate for the Persian force (300,000 Persians and 50,000 Medizing Greeks, i.e. Greeks who sided with the Persians) is not accepted, although his numbers for the Greek forces (38,700 hoplites and 71,300 light or unarmed auxiliaries) are given more credence. Modern estimates give the Persians a cavalry of 10,000 with 50,000 to 70,000 infantry (plus support), perhaps 20,000 Medizing Greeks, and another Persian force of 40,000 under another commander, Artabazus.

Many details of the battle itself are still not agreed upon. After more than two millennia, changes to topographical features have made troop positions and movements impossible to prove. Even the specific date of the engagement is unknown, although mid-August of 479 is widely accepted. The general strategies of the two sides, however, seem clear: the Persians wished to employ their cavalry on the plain, while the Greek force, using hoplites in phalanx formation, preferred not to give them that advantage.

With the main Persian force assembled along a front, perhaps 8 km long, north of the Asopus with a 2-km square wooden stockade (*c.*900 acres/360 ha) to their rear, Pausanias utilized the rough terrain of his position on the lower slopes of Mount Cithaeron successfully to fight off the Persian cavalry, killing their majestic commander Masistius. Pausanias then shifted his line westward towards Plataea and the Asopus, perhaps in need of better water supplies, and moved further down the slopes. The Persians were able to deny the Greeks the river by employing their mounted archers to harass parties sent to collect water. Eventually the Persians also choked up the Gargaphia spring, a major water source for the entire Greek force; this may have forced the Greeks to attempt a more desperate course of action.

For eight days the two forces faced each other across the Asopus, neither side willing to give up its favourable terrain to attack. But after four days of raids by Mardonius' cavalry, which cut the Greeks' supply lines, Pausanias made the decision to attempt a night withdrawal to secure provisions. Confusion during the withdrawal resulted in the division of the Greek forces: the Athenians were isolated on the left, the centre just outside Plataea itself, and the Lacedaemonians and Tegeans on the right.

Mardonius, sensing that the advantage was his, ordered a general assault but, after a furious battle, the Spartans defeated his Asiatic and allied troops. The Athenians held his Boeotian allies, who fought well but disengaged under the protection of the Theban cavalry once the battle against the Greek right had been lost. Mardonius himself died in the battle, triggering a Persian retreat into the stockade where they were slaughtered once the Greeks breached its walls. Artabazus, who had maintained his troops in reserve, watched the battle develop into a rout, then retreated to Byzantium without fighting. Attempts have been made to depict the Greek victory as a brilliant ploy on the part of Pausanias, but it is impossible now to determine whether the victory was a result of luck or a clever plan.

Casualties are difficult to estimate, but the Persians probably lost about 10,000 non-European warriors and 1000 Medizing Greeks; the Greek forces suffered casualties of perhaps just over 1000 men. The Greeks had won a resounding victory that demonstrated they could inflict tremendous punishment upon a numerically superior Persian force. The Persians were no longer a military threat to the Greek mainland.

Booty from the battle was tremendous. Dedications from the spoils were made at Olympia, the isthmus, and Delphi (the triple entwined serpent-column, the remains of which is now in Istanbul, was erected on a gold tripod at Delphi). So luxurious were the spoils that this is the moment cited in antiquity when the Greeks became enamoured of wealth.

To complete their victory, the Greeks turned to punish Thebes for its support of the Persians. After a short siege, several ringleaders were surrendered to allies, who quickly removed them to the isthmus where they were executed. Theban hegemony over Boeotia was also broken.

Even more than Marathon or Salamis, the victory over the Persians at Plataea determined the course of European history. Xerxes had been defeated at sea and on land. Instead of becoming a Persian satellite, the Greeks formed the Delian League and went on the offensive.

Plataea faded in significance after the battle until the middle of the 5th century when it joined the new Boeotian Confederacy with control of two votes. The Theban assault on the city in 431 is regarded by many as the real beginning of the Peloponnesian War and, although most inhabitants had fled to Athens for refuge, the remaining inhabitants only surrendered in 427 when the city was razed to the ground. Plataea was rebuilt after the war and remained independent until seized by the Thebans in 372, when refugees once again fled to Athens. Philip II of Macedon restored the city after the battle of Chaeronea (338) and the Plataeans exacted revenge against Thebes in 335 when they helped Alexander the Great destroy their old enemy. Although loyal to Rome during the Third Macedonian War, the city suffered along with the other Boeotian cities during the campaigns of Sulla in 86 BC.

Two cults, the Homonoia and the Eleutheria, which celebrated the great victory over the Persians, provided some fame for the city in the Hellenistic and Roman periods, but other than the restoration of its walls under Justinian (527–65) little else of significance is known about the city.

Summary

A city in Boeotia, Plataea was an ally of Athens and supported the Athenians at Marathon and Salamis before being sacked by the Persians in 479 BC. It was the site of a decisive Greek victory over the Persians in that year which finally removed the Persian military threat to Greece. The city continued to exist into the early Byzantine period.

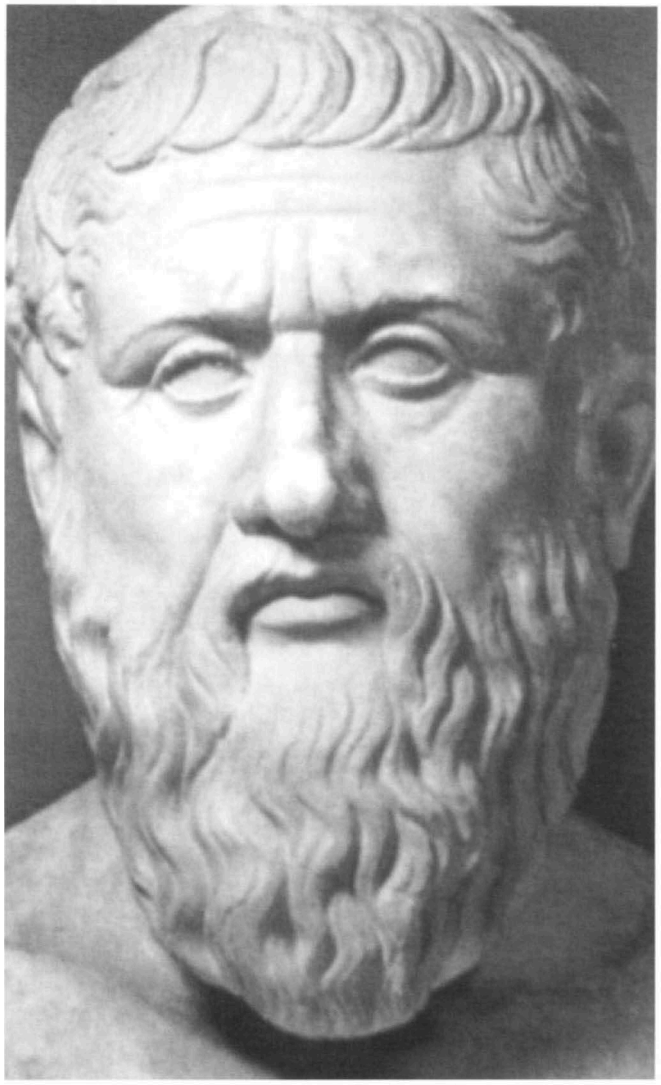
Plato 429–347 BC

Philosopher

Plato was destined for an active life in Athenian politics. He was a member of an Athenian family that traced its origins back to the famous lawgiver Solon, and although his close relatives Crito and Charmides were discredited by their actions during the constitutional disturbances of the last decade of the 5th century BC, Plato could have carved out his own path. As Plato himself tells us in his *Seventh Letter* (now taken to be genuine by most scholars), he indeed began adult life with the usual political ambitions and was invited by his relatives to join them. Their actions were repellent, but what finally deterred Plato from ever taking part in conventional political life was the way in which powerful people brought charges against Socrates that led to his death, an action that in Plato's mind condemned both the oligarchic forces and the democratic masses. He would now devote his life to unconventional politics; that is, "having decided that all existing cities are badly governed", he would investigate "the nature of justice in both the individual and the state".

Plato would have had very few models for his own investigations. Greeks by and large looked to poets for ethical paradigms and heroes. Heraclitus wove ethical doctrines into an intentionally enigmatic prose text that lacked the detail and argumentative rigour that Plato desired. Some of the Sophists dealt with ethical matters but did so less with a desire to learn the truth and more in order to train students to come out on top in any morally ambiguous situation. Plato found his model in what was then a minor genre, the Socratic dialogue; that is, a prose drama in which Socrates and one or more fellow speakers (dialogists) would raise and analyse, or at any rate discuss, ethical matters. According to Aristotle, the first to write Socratic dialogues was a certain Alexamenos of Teos. There is also credible evidence that an Athenian, Simon the cobbler, would scribble notes for himself that he would later work up into a more polished form. How philosophical these earlier dialogues were we can only guess. They may have been similar to the chatty and anecdotal Socratic dialogues of Xenophon that are still extant. But whereas Xenophon was chiefly interested in retelling those conversations in which Socrates expressed his own views, Plato was more drawn to the Socrates who, when it came to the most important qualities of ethical life, preferred to withhold his own opinions, frequently willing to bring the discussion to an impasse (*aporia*) rather than impose upon his fellow dialogists a conclusion that he himself could not fully endorse.

Socrates did this in part because, as he himself is made to say in Plato's *Apology*, the profession of one's own ignorance is a necessary first step on the way to the truth. He also, again according to Plato, believed that whatever truth one does attain will occur only as a result of one's having actively



Plato, Roman copy of a Greek original

wrestled with the matter and elicited it out of one's own soul – a difficult matter, to be sure, but possible for a bright person who is asked the right questions. Plato, who no doubt often found himself in this situation with Socrates, proceeded to shape both real and imagined dialogues with this intriguing old man into a powerful literary form. There is therefore no voice within the dialogues that declares itself to be that of the author arguing his own cause; nor does Plato even put himself forward as narrator of any dialogue. The reader is thus put on constant guard, never sure at first or perhaps even after consideration whether any particular idea expressed by Socrates or anyone else comes with Plato's own endorsement. This is Plato's way of reproducing Socrates' habit of encouraging would-be philosophers to work things out as much as possible by themselves.

Quite naturally, therefore, apart from the speech that forms the *Apology*, Plato's earliest dialogues tend to end in the doubt that earns them the label "aporetic". Plato brings Socrates together somewhere in Athens with one or more acquaintances. Whether or not they have a specific question for him, Socrates soon raises the level of discussion from the ordinary to the philosophical. In the *Laches*, for example, the question of how fathers can educate sons in bravery quickly becomes an investigation of the very meaning of bravery. The *Euthyphro*, *Lysis*, and *Charmides* deal likewise (and respectively) with the other commonly recognized virtues of piety, friendship, and *sophrosyne* (for which "temperance, prudence, moderation" are but inadequate translations). The *Hippias Major* (whose authenticity is still doubted by some) seeks to define *kalon* ("good" or "beautiful"), a term that comprises both aesthetic and moral values. Perhaps most aporetic of all is the *Hippias Minor*, which manages to shock even Socrates when the dialogue leads him and Hippias to the statement that the man who does wrong willingly is superior to the man who does so only involuntarily. And while not aporetic, the moral message of the *Crito* is clear: Socrates owes a debt to Athens that will not allow him to escape from prison, where he lies under sentence of death.

A question that is raised more than once in these early dialogues, most noticeably in the *Laches*, is how, supposing that we can ever attain a sufficiently correct opinion concerning these individual virtues, can one generation instil them in the next. This is an important question at any time, but Plato's 4th-century BC Athens was still feeling the effects of Socrates' 5th-century BC Sophists, the professional teachers who come off so badly in Plato's dialogues not so much for their pretentious ways and their love of money as for their claim to be able to teach virtue. Whereas Hippias in the *Hippias Minor* is artfully led to an immoral conclusion unwillingly, the Sophists of the *Euthydemus* with malicious glee delight in their ability to twist the normal ambiguities of ordinary language into startling paradoxical statements, a skill that they claim will enable a citizen to excel in the law courts or wherever such "eristic" skills are valuable. The question of whether virtue can be taught at all is addressed head on in the *Protagoras*. At first, Protagoras understandably argues with a sceptical Socrates that virtue (*arete*) can indeed be taught, and by no one so well as he. In the course of the discussion, however, they somehow change sides so that by the end it is Socrates who now believes that virtue is teachable, Protagoras arguing against his earlier position. This aporetic turnabout, artfully stage-managed by Socrates and Plato, has the desired result that Socrates' young friend who had been on the point of paying Protagoras his huge fee to learn virtue is now almost certainly deterred from doing so.

Whereas up to this point Plato was content to reveal the essentially immoral nature of sophistic teaching by indirection, in the *Gorgias* he starkly reveals the results of these ill-thought-out doctrines. Gorgias himself is shown merely to be morally purblind. His students, however, Polus and Callicles, provide examples of the totalitarian political character who embraces the idea that might makes right. Another student of Gorgias reveals in the *Meno* how little he knows about the nature of virtue (as opposed to its many manifestations in different people and situations).

Having shown in so many dialogues both the existence of widespread ignorance on ethical matters and the necessity for exposing its many forms, it was time for Plato to flesh out some of the many hints he dropped in the aporetic dialogues of a more positive doctrine. In the deathbed setting of *Phaedo*, Socrates not only elaborates on his earlier statements in the *Apology* and *Crito* on the necessity of devoting one's life to the

study of wisdom (which is the very serious meaning he gives to the word *philosophia*), he describes the immortality of the soul and those entities he calls Ideas or Forms. (In the *Meno* real learning was said to be the immortal soul actually recollecting what it had known before.) Although the metaphysical nature of the Forms is often studied by itself, when viewed in their contexts the Forms clearly represent an essential part of Plato's overarching ethical programme. While it is not difficult to enumerate the qualities of these unchanging, eternal, and immanent Forms, it is quite another thing to explain how one might attain direct apprehension of them for oneself.

The *Phaedo* shows how even Socrates' own most devoted followers can accept the immortality of the soul (not a difficult thing for a Greek) and yet prove incapable of absorbing it into their philosophical belief. The immortality of the Forms is even more difficult to incorporate. The *Symposium*, primarily about love, likens the apprehension of the Forms to the initiation into a mystery religion, which cannot be revealed to an outsider. In the *Republic*, however, Plato took the plunge, sketching out (his metaphor) an elaborate scheme for instituting and governing a state where justice would prevail in both its own constitution and in the very souls of its citizens. Its first book (of ten) is modelled on an aporetic dialogue in which the object of discussion is justice. Socrates, however, not allowed to run off after having dispelled various mistaken notions, is compelled to continue with a more positive doctrine of justice, which, it turns out, governs some of the cardinal virtues treated in earlier dialogues. Maintaining the proper relationship among the parts of the soul makes for a just individual, who in turn along with a like-minded citizenry will serve the state – whether as ruler or follower – so that all elements work together in a harmony that Socrates calls justice. Rulers can come only from that elite group of men and women who have pursued a course of education so rigorous that they are able to apprehend the Form of the Good, the nature of which demands that they work for the good of the state. Complementary to the idea that Good demands good is the Socratic paradox that nobody does wrong willingly.

The *Phaedrus*, like the *Symposium*, seeks to understand love through speeches; here, however, Socrates emphasizes less the content of a speech than its form, which, it is argued, should be clearly and naturally articulated. This notion of proper composition calls for a discussion of what Plato will develop in later dialogues, namely analysis of the subject to be defined by a process of collection (of all similar things) and division (of the whole into its parts). The *Phaedrus* is one of Plato's great literary accomplishments. On the whole, however, it may be said that after having considered, with some justification, the *Republic* as the culmination of all of his earlier virtue-oriented writings, Plato now felt free to explore and develop some of the logical consequences of his theory of Forms. This is not to say that the later dialogues lack all literary touches – the *Theaetetus*, for example, is informed by metaphors of pregnancy and birth that illuminate the process whereby Theaetetus is questioned on the meaning of knowledge – but it must be admitted that the *Sophist*, *Statesman*, and *Philebus* have far fewer readers (outside philosophy departments) than the earlier dialogues. Among late dialogues, perhaps only the *Timaeus*, with its fascinating attempt to describe the cosmos by marrying Greek science and religion, commands a wide readership. The *Laws*, the longest dialogue, both complements and, as an older and more conservative Plato must have imagined it, corrects the picture of the ideal state described earlier in the *Republic*.

Plato's influence on later thought was felt immediately and has lasted until the present. The school he founded in the sacred grove known as the Academy lasted until the 6th century AD. Aristotle, denied advancement with the Academy, continued with his own school in Athens and in his writings continued until the end of his life to argue with his teacher. Nor could any other school of western philosophy ignore him; they either adopted, adapted, or overtly rejected the basic doctrines of Plato.

Biography

Born in Athens in 429 BC to an ancient and wealthy family, Plato was destined for a political career but decided to devote himself to philosophy after the death of Socrates. He founded a philosophical school known as the Academy whose original aim was to train prospective statesmen. He visited Syracuse several times in a vain attempt to convert Dionysius II to his philosophical ideas. He published his theories in the form of dialogues, dramatic conversation pieces, of which some 30 survive. He died in 347 BC.

Plethon, George Gemistos *c.*1360–1452

Philosopher

The philosopher George Gemistos (he adopted the pseudonym Plethon around 1439) was both one of the most original thinkers of the Byzantine period and also a significant influence on the development of Platonic studies in Italy during the Renaissance. Little is known of the first 50 years of his life, but from an early stage he held unorthodox views, taking an interest in Neoplatonism and Zoroastrianism. Around 1410 he was exiled from Constantinople by the Byzantine emperor Manuel II Palaiologos, on suspicion of heresy and paganism, and sent to Mistra in the Peloponnese where he spent most of the remainder of his life, attached to the court of the despots of the Morea.

In spite of his relegation to a distant province, Gemistos's powerful personality soon attracted a number of promising students to study under him, including the future cardinal Bessarion, George Hermonymos, Laonikos Chalkokondyles, and Demetrios Rhaoul Kavakis. He became the centre of a lively literary circle and acquired a reputation as the most brilliant exponent of Platonism.

Gemistos also appears to have regarded himself as an adviser to the young despot of the Morea, Theodore II Palaiologos (1408–43), perhaps in conscious imitation of the similar role played by Plato at the court of the tyrant Dionysius II of Syracuse. Between 1415 and 1418 he wrote a series of rhetorical works that drew heavily on Platonic ideas and which offered solutions to the ills then afflicting the Byzantine empire. His *Advisory Address to the Despot Theodore on the Peloponnese* and his *Address to the Emperor Manuel on Affairs in the Peloponnese* proposed various reforms to improve the condition of the Byzantine province of the Morea. He urged the establishment of a standing army, composed of Greeks rather than of mercenaries. To encourage recruits soldiers should be exempt from taxation, but the monastic vocation was to be discouraged because it burdened society with idle mouths. Some of his proposals reflect the utopianism of Plato's *Republic*, notably his suggestions that the Morea should be ruled, under the despot, by a council of dedicated, moderate men, and that all property should be held in common. Both works advanced the idea of Hellenic nationalism as opposed to the traditional universalism of the Byzantine empire.

A turning point in Gemistos's life occurred in 1438 when, at the age of nearly 80, he joined the retinue of the Byzantine emperor John VIII to attend the Council of Florence. He played little part in the union of the Churches but engaged in lively debate with Florentine scholars on the relative merits of the philosophies of Plato and Aristotle. Gemistos naturally took Plato's side, even going so far as to adopt the pseudonym Plethon, with its connotations of "a second Plato". During his stay Plethon circulated his Greek treatise *On the Differences of Plato and Aristotle*, in which he rejected the philosophy of Aristotle and championed that of Plato. The work was interpreted by many as an attack on Christianity, largely because Plethon made no secret of his admiration for those aspects of Plato's thought that were incompatible with Christian doctrine, particularly the concept of *metempsychosis*, the transmigration of souls. Others, however, were deeply impressed by his work, especially the Florentine humanist Marsilio Ficino who later played a leading role in the Platonic Academy established by Cosimo de' Medici at Careggi near Florence in 1462. Plethon can therefore be credited with having aroused the initial interest in Platonism that was later to have a profound influence on the development of Florentine political thought.

Plethon's latter years were spent teaching and writing at Mistra. He produced an essay on Strabo that adopted a sceptical approach to the ancient geographer, rejecting monsters and mythical realms. However, his last work, *On the Laws*, was his most controversial, advocating a new religion based on a synthesis of Neoplatonism and Classical paganism, stating that Zeus was the supreme god, and containing hymns, prayers, and liturgies to pagan deities. Not surprisingly, the work caused considerable offence to the Church authorities, and the patriarch of Constantinople George Scholarios later ordered that all copies be burned on pain of excommunication.

Nevertheless, some fragments of *On the Laws* survive, including a few autograph manuscript sheets. These, along with the *On the Differences*, ensured that the debate on the relative merits of Plato and Aristotle that Plethon had initiated in Florence would be continued after his death in 1452. The controversy was revived in earnest in 1458 when George of Trebizond wrote his *Comparisons of Plato and Aristotle* with a view to exposing Plethon as a heretic, and provoked a series of responses by the members of the Academy of cardinal Bessarion in Rome. Bessarion's *Against the Calumniator of Plato* (1469) which, unlike Plethon's book, was available in Latin, completed the work of his teacher by convincing the Italian humanists that Plato's philosophy was compatible with Christianity and worthy of study in its own right.

Thus it was in Italy, rather than his native land, that Plethon's influence was to be most lasting. By a curious turn of events, it was to Italy that his remains were to return. In 1464, during a campaign against the Turks in the Morea, Sigismondo Malatesta, hereditary ruler of Rimini, came across Plethon's grave at Mistra and had the philosopher's bones exhumed and transported back to Italy. They were reinterred in the Tempio Malatestiano in Rimini, where Plethon's tomb can still be seen.

Plotinus AD 205–269/70

Philosopher

Plotinus was the most influential and important philosopher of ancient Greece after Plato and Aristotle. His philosophical system, though based primarily on Plato, was deeply influenced by Aristotle. Stoicism, too, was an important ingredient as well as the ideas of those intervening philosophers and scholars who commented on, developed, and frequently sought a rapprochement between the thought of their great predecessors. His influence, at first direct, on his sucessors Porphyry, Iamblichus, and Proclus and, subsequently, indirectly through them, on later thinkers had a profound and lasting impact on the way in which Greek philosophy, and particularly Plato, was viewed and on the development of Christian theology, particularly in the Orthodox tradition, which was more receptive of Platonic ideas than the western Church. It is, then, important to grasp some of the basic tenets of Neoplatonism that were given their classic shape by Plotinus, though refined and systematized by later Neoplatonists.

Although Plotinus was deeply imbued with the philosophy of Aristotle as well as that of the Stoics, he regarded himself primarily as a follower of Plato, the hidden implications of whose works he sought to explicate and develop. The term Neoplatonist is modern and Plotinus would have regarded himself simply as a Platonist. He came from Lycopolis in Egypt and was educated in the philosophical schools of Alexandria. Political circumstances brought him to Rome where he founded a school in a private house. He did not start to write down his ideas until he was 50 years old and his system was well thought out, but his treatises give the impression of a lively philosophical dialogue, at times almost of a seminar, in which problems, issues, and objections are thoroughly aired. His treatises were not published until many years after his death by his pupil Porphyry who arranged them in sets of nine: hence the curious title *Enneads*. One result of Porphyry's diligent work as an editor is that Plotinus is the only philosopher of antiquity whose works survive in their entirety.

Plotinus laid great emphasis on the two-world view of Plato, who regarded the physical world as an image of a transcendent world of archetypal Forms and the true home of the soul which, during its earthly life, may be considered to be in exile. Plotinus, however, gave far greater stress to this sense of exile and the necessity for the soul to divest itself of its earthly burdens and return to its original home by a process of moral and intellectual effort leading to mystical union with the supreme principle. At the same time, however, he could see the physical world, in the optimistic context of Plato's *Timaeus*, as the best possible image of its divine maker, indeed as a god in its own right. The idea of return to God as father from exile in this world and the spiritual earnestness with which it was expressed by Plotinus were naturally appealing to Christian writers such as Basil. For Plotinus, however, this return of the soul was not dependent on the grace of God but on the innate capacity that we all have, if only we would use it, to recognize our own worth, our kinship, and ultimate identity with the divine. Plotinus himself had little time for religious cults and even less time for those such as the Gnostics who denigrated the physical universe as the creation of a fallen God.

Equally appealing and influential was Plotinus' complex development of Plato's transcendent world into three levels: above all is the One, the source of all, which gives rise to Intellect (*nous*) from which Soul derives. Although these levels of reality are subordinate to each other, they provided a fertile source for Christian Trinitarian theology. Less obvious but more subtly influential were his complex speculations about the relationships within Intellect which provided a model and a language that Christian theologians could employ to describe mutual relationships within the Godhead. For Plotinus thinker, thinking, and object of thought are substantially identical, though conceptually distinct.The concept of the One also proved influential. For Plotinus this ultimate principle, source of all unity, was beyond all description. It could be indicated only by affirming what it was not. This so-called negative or apophatic theology was to have a long following, including Gregory of Nyssa and pseudo-Dionysius. Equally influential was the way in which Plotinus attempted to describe and analyse his personal mystical union with the One, "the flight of the alone to the alone".

The *Enneads* were read and quoted by Eusebius of Caesarea, Basil the Great, and Gregory of Nyssa. They became fashionable again in the 11th century partly through the interest of Michael Psellos, who also knew Proclus' commentary on them. In the 15th century Gemistos Plethon's Neoplatonic religion owed much to Plotinus and it was his pupil Bessarion who brought manuscripts of Plotinus to the west. But the indirect influence of Plotinus is probably of even greater importance for the Greek east. Although Plotinus had never been official head of the Academy or even visited Athens, his interpretation of Plato gradually became accepted and more systematically

developed under a sequence of Academy heads including Plutarch of Athens, Syrianus, and, most importantly of all, Proclus, whose works had a profound influence on pseudo-Dionysius the Areopagite.The great pagan philosophical and Christian centre of Alexandria was also influenced both directly and through the Academy at Athens, as scholars moved freely between the two cities. Although this form of later Neoplatonism was in many respects quite different from that of Plotinus, the *Enneads* remain the vital source and the most dynamic exposition of Neoplatonic ideas and thus the essential text to which all subsequent Neoplatonists have returned and from which all modern study of Neoplatonism takes its start.

Biography

Born at Lycopolis in Egypt in AD 205, Plotinus was educated in Alexandria where he was a pupil of Ammonius Sacas. In 245 he moved to Rome where he founded a school and taught philosophy. His pupils included Porphyry. Plotinus was the greatest of the Neoplatonists and wrote philosophical treatises which were published after his death by Porphyry as *Enneads*. He died in Campania in 269/70.

Plutarch *c.*AD 50–120

Prose writer

Plutarch came from the Boeotian town of Chaeronea where he lived for most of his life. In his writings there are regular references to various local landmarks, such as the tomb of Lysander on the road leading from Delphi to Chaeronea (*Lysander*, 29. 3). These details cumulatively suggest his fondness for his birthplace, which he once wryly said that he did not wish to leave, for fear of making a small place even smaller (*Demosthenes*, 2. 2). In addition we have an inscription from the base of a statue which was found in Chaeronea: "Philinus dedicated to the gods [this statue of] Plutarch the benefactor" (W. Dittenberger, *Sylloge Inscriptionum Graecarum*, 3rd edition, 1915–24, 843B). This inscription shows that Plutarch had a warm relationship with his home town, but it is clear from his writings that he still found time to travel. Thus at Ravenna Plutarch claims to have seen a statue of Marius (*Marius*, 2. 1), and in northern Italy, when he was travelling with his friend the ex-consul Mestrius Florus, he visited the civil war battlefield at Bedriacum (*Otho*, 14. 2). For the last 30 years of his life Plutarch was a priest at the Greek sanctuary of Delphi (*Moralia*, 792F) and the knowledge of antiquities that he acquired there can be seen throughout his works. For example, Plutarch notes that there existed at Delphi a statue of *Aphrodite of the Tomb* and he uses this fact to suggest why the Romans used to sell items for funerals in the precinct of Libitina/Venus (*Moralia*, 269B). In addition he wrote whole essays that draw on his knowledge of Delphi, including *On the Pythia's Prophecies* and *On the Delphic E*.

Plutarch undoubtedly loved Greece, but at the same time he was a Roman citizen, as we know from an inscription that refers to him as Mestrius Plutarch (Dittenberger, 843B). This name suggests a link between his acquisition of citizenship and his friendship with Mestrius Florus, who was one of a circle of influential Plutarchan contacts that also included Sosius Senecio, to whom the *Parallel Lives* are dedicated. Thus Plutarch was a Janus figure, a Roman citizen who retained a strong Greek identity, but who could see positive qualities in both cultures. Plutarch valued the stability that came with the Roman imperial system (*Moralia*, 317C), but saw the influence of Greek culture on Rome as valuable and even as necessary: "for the time in which Rome reached its greatest success was the time when it welcomed Greek studies and education" (*Cato the Elder*, 23. 3).

Plutarch's most remarkable achievement lies in his vastly rich and varied body of written work. The Catalogue of Lamprias, which is itself incomplete, lists 227 different works. Today we possess 78 essays by Plutarch on a range of topics, which are known collectively as the *Moralia*, and 50 *Lives*. Subjects that Plutarch addresses in the *Moralia* include philosophical questions, historical issues, religious antiquities, rhetoric, and literary themes. Plutarch's most popular works, however, are the *Parallel Lives*, in which he presents pairs of biographies, one of a Greek and one of a Roman protagonist, including in most cases a brief comparison or *synkrisis* at the end. These *Parallel Lives* were not Plutarch's first attempt at writing biography. Probably before AD 96 he had composed the *Lives of the Caesars* about the eight Roman emperors from Augustus to Vitellius. Unfortunately, only the *Galba* and the *Otho* have survived, although there is some material in the *Moralia* that it is tempting to think may have appeared in the other lost imperial *Lives of the Caesars*. For a man who claims that his knowledge of Latin was acquired later in life (*Demosthenes*, 2. 2. 4) researching these imperial biographies cannot have been easy and Plutarch certainly did not have the advantages of the later imperial biographer Suetonius, whose post as imperial secretary gave him access to some unique documents and archives about the emperors. However, Plutarch persevered with his reading of Latin sources when researching the subjects of his *Parallel Lives*. This strategy of pairing Greek and Roman lives was innovative and symptomatic of an era when interaction between Greek and

Roman cultures was gaining momentum: the *Parallel Lives* appear to have been written early in the 2nd century AD under the more enlightened principates of Trajan (emperor AD 98–117) and Hadrian (emperor AD 117–38). Previously, biographers such as Cornelius Nepos and Varro had certainly written groups of lives centring on men of a particular profession, such as orators, poets, and generals, but Plutarch allowed himself the potential for developing vivid and subtle portraits by restricting himself to delineating only two subjects at a time in the *Parallel Lives*, apart from the one double pairing of *Agis and Cleomenes* and *Tiberius and Gaius Gracchus*. His biographical corpus as a whole was extensive, but he kept his readers' interest alive by his tremendous powers of description and by his astute eye for detail. As Plutarch famously says: "Nor is it always the most famous actions which reveal a man's good or bad qualities: a clearer insight into a man's character is often given by a small matter, a word or jest, than by engagements where thousands die" (*Alexander*, 1. 1–2). Rather than offer long authorial analysis of an individual's personality, Plutarch often allows character to emerge from carefully chosen anecdotes, which enable readers to draw their own conclusions about the subject of the biography. Moreover, Plutarch often devotes considerable attention to characterizing other protagonists in his biographies. For example, his portrait of Cleopatra in the *Antony* is unforgettably vibrant, and by serving as a foil to Antony, the Egyptian queen further deepens our understanding of the Roman general.

Plutarch's writings rapidly became popular. In the Byzantine era there were more transcriptions made of Plutarch than of any other ancient author. Strikingly, one scholar, John Tzetzes (died *c.*1180), when he fell on hard times, resigned himself to selling almost all his library but refused to part with his Plutarch. The individual to whom we owe the greatest debt for the preservation of Plutarch's works is undoubtedly Maximos Planudes. In 1294/95 Planudes, who was devoted to Plutarch, assembled a group of scribes whose task was to make copies of a large portion of the *Moralia*, as well as the *Galba* and the *Otho*. The *Parallel Lives* and the remaining essays from the *Moralia* were added to the project in 1296. Without Planudes's determination to collect the scattered pieces of the Plutarchan corpus we would almost certainly have had a much more fragmentary knowledge of Plutarch's work today. Testimony to the continuing interest in Plutarch can be found in the pervasive but inaccurate medieval tradition that the author had served as tutor to the emperor Trajan, just as Aristotle taught Alexander. There is even a Latin version of a "letter" supposedly written by Plutarch to Trajan and consisting of a compilation of quotations from the surviving works. During the Renaissance Plutarch was translated into French by Amyot (*Lives* 1559 and *Moralia* 1572) and into English (via the French) by North (*Lives* 1579). Material from Plutarch was also used by William Barker in 1578 to supplement the incomplete text of Appian on the civil wars. Such translations provided crucial inspiration for Shakespeare and Montaigne. More recently Mary Shelley made Frankenstein's monster a devotee of Plutarch's *Lives* and Harry S. Truman allegedly learned some valuable political lessons through reading the *Lives*. Today Plutarchan studies are thriving on a global level: not only is there *Ploutarchos*, the journal of the International Plutarch Society edited by Dr F. Titchener, but one can also access *Chaironeia*, a lively site devoted to Plutarch on the World Wide Web maintained by the University of Texas.

Poetry, Epic

Ancient

"Homer is enough for everyone", remarked Theocritus (16. 20), and interestingly this is true: the Homeric poems stand at the beginning of extant Greek literature, and the scope of their achievement is such that they constitute defining examples of what came to be known as epic poetry, as well as becoming a fixed standard against which all subsequent epics were assessed. An epic on the Homeric model is a substantial narrative poem that is composed in dactylic hexameters, that has an elevated tone, and that concerns the exploits of gods and heroes, the subject matter being drawn from traditional myth. Epic poetry also had numerous conventional features: formulaic language, frequent archaisms, extensive use of parataxis, ring-composition, type-scenes (e.g. describing arming, dining, etc.), digressions, and extended similes. This picture is consistent with modern notions of what constitutes epic; the ancient understanding of the genre, however, remains uncertain in important respects. The word "epic" – derived from *epos*, literally "word" – seems originally to have been used chiefly of poetry composed in dactylic hexameters (not only the Homeric poems), but also didactic poetry in the Hesiodic tradition and of philosophical poems by early philosophers, such as Parmenides and Empedocles. In later antiquity the term was applied more narrowly to the genre exemplified by the Homeric poems. It is not clear precisely when *epos* became "epic" in the modern sense, although it seems that some idea of an epic genre is implicit in Aristotle's treatment of poetry.

Aristotle's *Poetics* was enormously influential in consolidating and determining ancient views of the genre. Although ostensibly concerned with tragic poetry, the *Poetics* refers to the Homeric poems more often than to any tragic text, and Aristotle's keen engagement with epic is everywhere in evidence (chapters 23 and 24 are particularly relevant). Central for Aristotle is the organic unity of plot (*mythos*), which must comprise a "beginning, middle, and end". As in the case of tragedy, epic plots should be compact, and their unity should reside in events, not character. In this light he called attention to the conspicuous superiority of the Homeric poems and compared them favourably with other products of the early epic tradition. Later critics occasionally offered a broader definition of epic, suggesting, for example, that didactic and pastoral poetry be included (Quintilian, 10. 1. 46, 10. 1. 85), but the view implicit in Aristotle's *Poetics* remained dominant, constituting a point of departure for later poets.

As early as Aristotle (e.g. *Rhetorica*, 1406b3; *Poetics*, 1459b35), commentators had regularly viewed many of the conventional features as simply characteristic of epic dignity; during the 20th century scholars have determined that the style of Homeric poetry and the character of its narrative were indicative of the oral nature of epic poetry in early Greece, and that many apparently idiosyncratic features of these poems were rooted in a tradition of at least partially improvised song. This has led to a widely accepted distinction between "primary", or traditional oral epic and "secondary", or literate epic, the familiar tradition of epic poetry composed with the aid of writing by a literate poet.

It is important to note that the *Iliad* and the *Odyssey* were not the sole products of the early epic tradition. There is evidence for a series of poems called the Epic Cycle, which seem to have offered an account of the world from the beginning to the close of the heroic age. None of these poems is extant, but fragmentary evidence – most notably summaries of a number in various late mythographers (of especial importance are those by Proclus) – allows us to form some impression of the series. Best attested are the poems describing the Trojan War. The *Cypria* provided the background to the war and events leading up to the point at which the *Iliad* begins. There is some evidence to suggest that the beginning and the end of the *Iliad* were adapted to fit more comfortably in the sequence. The sequel to the *Iliad* was provided by the *Aethiopis*, the *Little Iliad*, and the *Iliou Persis*. These poems follow the Trojan myth from the death of Hector to the sack of Troy and the departure of the Greeks. The *Nostoi*, which detailed the homeward journeys of some of the central Greek warriors, marks a transition to the *Odyssey*, the action of which was followed by *Telegonia*, which brought an end to the story of Odysseus' life. In addition to the Trojan War epics, the Epic Cycle is known to have comprised shorter poems on largely unrelated mythic themes: a *Theogony* and *Titanomachy*, covering ground familiar from Hesiod; and an *Oedipodia*, *Thebais*, and *Epigonoi*, providing influential treatment of Theban myths. Other early epics were no doubt in circulation in antiquity, and some may have been included in the Epic Cycle, but no trace of such an ascription can be found among extant ancient sources. We are aware of a number of other poems from the 7th and 6th centuries BC that are often described as epics, although that term may simply mean that they were hexametric. Some of these shadowy poems, such as the *Naupactia* and the *Theseis*, seem to have treated traditional myths; others, like the *Arimaspea* ascribed to Aristeas of Proconnesus, seem to have had affinities with other poetic traditions.

The whole Epic Cycle was ascribed to Homer by many, but other poets are frequently named. Among them are Stasinus, Arctinus, Lesches, and Thestorides, although today these poets are at best little more than names. The Homeric ascription is none the less telling, for it reflects the character of these poems and the way in which they complement the *Iliad* and the *Odyssey*, and in this latter point we can discern the underlying motivation for the formation of the Epic Cycle. As the adjustments made to the beginning and end of the *Iliad* suggest, the cycle's sequence is not natural and indicates some kind of editorial intervention. The precise nature and date of this intervention, however, remain uncertain. Whereas explicit mention of the cycle as a whole is not found until late antiquity, the Trojan cycle seems to have been current at least as early as the 4th century BC, when the alternative beginning of the *Iliad* is first attested.

Although evidence of the existence of the Epic Cycle is too fragmentary to allow any certainty, it is likely that the cycle, along with the Homeric poems, represented a fixing of the oral

tradition of epic in textual form, and this may be true of the other epics known from the early period. The transition to "secondary" epic seems to begin in the 5th century BC. Panyassis of Halicarnassus, who was a kinsman of the historian Herodotus, wrote a *Heraclea* that was well regarded by ancient critics. Although the few surviving fragments seem to reflect the conventional language of oral epic, we seem for the first time to be confronted with a poet who was clearly a historical personage. More noteworthy was the *Thebais* of Antimachus of Colophon, who flourished at the end of the 5th century BC. Although few fragments of any length survive, it is clear both from what little remains and from the ancient *testimonia* that Antimachus' work was characterized by a new sensibility that manipulated the language of epic in a selfconscious way. For subject matter Antimachus looked back to the Theban myths of the *Thebais* from the Epic Cycle, but his treatment seems to have anticipated the learned and allusive manner of Alexandrian poetry. Another notable development from about the same time is the work of Choerilus of Samos, whose *Persica* treats a historical subject, the Persian invasion of Greece. Hexametric poetry on historical subjects is first attested in the second half of the 8th century BC with the *Corinthiaca* ascribed to Eumelus, but Choerilus' *Persica* is the first known work to present what is clearly an epic treatment of such a theme. Although this poem survives only in brief fragments (some of them on papyrus), we are fortunate in having a few lines (fr. 317 *SH*) that seem to derive from a passage (possibly the proem) in which the poet addressed the issue of stylistic innovation.

It is difficult to gauge with certainty the degree to which epic flourished in the post-Classical world. There is considerable evidence for poems in hexameters – a number clearly of some length – and this has led many to conclude that the literary landscape of the Hellenistic world was richly populated with many epic poems that are now lost. Other scholars are more sceptical, arguing that hexametric poetry is not necessarily epic; these lost poems could easily have been accounts of historical events or panegyrics. Whatever the truth of the matter, it remains nonetheless true that the Hellenistic world provides some striking responses to the challenge posed by the Homeric poems. The most obvious of these is the *Argonautica* of Apollonius of Rhodes, a product of the scholarly world of the royal library at Alexandria and the only epic extant from the period between the Homeric poems and the imperial period. Apollonius' epic is a creative reworking of the Homeric poems that recounts the expedition of Jason and the Argonauts in quest of the golden fleece. Apollonius' response to Homer is flexible and subtle, drawing on Homeric language and narrative manner yet producing an epic very different from the Homeric poems, one that is very much rooted in the tastes and preoccupations of the literary circle of the Alexandrian court.

Equally notable was the epic written by Apollonius' contemporary, Callimachus, whose (now fragmentary) *Hecale* represented a striking attempt to produce a new kind of epic. The poem recounted the reception of Theseus by a humble old woman named Hecale on the night before the hero was to face the bull of Marathon. The time-frame of the poem seems to have covered little more than a single day, but through the careful use of digression, flashback, and foreshadowing, the poet offered considerable insight into the two central figures. The focus on Hecale's humble hospitality rather than the celebrated combat with the bull seems to indicate a deliberate attempt to reposition epic tone; it is as though the *Odyssey* were to be retold from the point of view of Eumaeus or Eryclea.

The most influential successors to the Alexandrians were Roman poets such as Virgil, Ovid, and Lucan. But Greek epic continued to be composed in the imperial period. Quintus of Smyrna, writing in the 3rd century AD, produced the *Posthomerica* in 14 books, which dispenses with the familiar epic proem and continues directly from the last line of the *Iliad* to treat the Trojan myth that originally formed part of the Epic Cycle. On a more ambitious scale was the *Dionysiaca* of Nonnus of Panopolis. Composed in 48 books – the aggregate total of the *Iliad* and the *Odyssey* – this poem narrated the birth of Dionysus and his battles in India. Nonnus' elaborate language and highly rhetorical manner constitute an attempt to forge a new kind of epic style; in his detailed literary and mythological learning Nonnus is reminiscent of the Alexandrians. The influence of Nonnus can be detected in the small-scale epics on Trojan themes by Colluthus and Tryphiodorus.

Byzantine and Modern

Epic is a notoriously difficult genre to define. It would be possible to argue that medieval and modern Greece have had no epic after the first Byzantine centuries, making this article a very short one. The medieval *Digenis Akritis* is as much a romance as it is an epic, while the epic deeds of the heroes of the revolution of 1821 were sung in the brief framework of the klephtic ballads. The most characteristic Greek epics of the 20th century, those of Kostis Palamas and Nikos Kazantzakis, also have a lyrical intensity (Palamas) and a philosophical depth (Kazantzakis) which would lead many to exclude them from the genre. However, if one retreats a little from the demand for fully fledged epics and looks for the characteristics of epic in poems which are shared with other genres, a considerable number may be found. The major characteristics of epic will here be assumed to be length, narrative, heroism, a number of books divisible by 12 (in the tradition of Homer and Virgil), and a sense that the poem concerned represents, in some totalizing way, a community at an important stage of its history.

In early Byzantium the literary tradition of the ancient epic was still alive, being used for histories of cities and encomia of famous personalities. There was also a genre of epic on mythical subjects, which reached its climax in the 4th century with the *Dionysiaca* of Nonnus of Panoplis, recounting in 48 books of hexameters the story of the god Dionysus in India. Despite their refined Classical form and subject matter, these poems show an increasingly medieval world view. After Nonnus, poems with epic tendencies abandoned the hexameter, which linguistic developments had made increasingly difficult to write in and restricted to an audience of a small caste of literati. Epic came to be composed in the Byzantine 12-syllable line: the best-known examples are a series of poems by George of Pisidia celebrating the achievements of the emperor Herakleios. After the 7th century the epic dimension of poetry is lost, to reappear, probably in the 12th century, in *Digenis Akritis*. The metre then used was the 15-syllable political verse – the national metre of modern Greece, used in all the poems discussed below until the end of the 19th century. During this period it may with some justification be felt that any medieval or modern Greek epic could only have been written in that metre.

At the beginning of the 20th century, when several of its manuscripts had been found, the medieval poem *Digenis Akritis* was hailed as the "national epic of the modern Greeks". However, it was soon discovered that such nationalist labels were inappropriate. The society represented in the poem is that of the Byzantine-Arab borders, and its hero acts as a policeman against bandits, mainly Christians. One may speculate that oral epics played some role in the genesis of the poem, and that at least one of them, the "Lay of the Emir" (Digenis's father), celebrated the exploits of an Arab raider against Byzantium. However, the axis of the poem's narrative and the inspiration of much of its heroism is the relationship between Digenis and his wife, whom most of the bandits are seeking to steal from him – and this is the basis for the categorization of the poem as a romance. It is unfortunate that neither of the surviving medieval manuscripts of *Digenis Akritis* is internally convincing, while later versions, based on a fusion of the two medieval poems, move steadily away from the epic.

The *Chronicle of the Morea* also deserves to be examined as an epic. The society concerned is that of the Greek Peloponnese under a ruling caste of western crusaders. The poem is expressly written to remind a generation growing up in the early 14th century of the exploits of their ancestors, who won the principality in 1205 after the Fourth Crusade. The poem is very long and has many heroic passages, together with others which suggest that the author was more at home with administration and documents than on the battlefield. No modern society is able to sympathize with the anti-Byzantine and anti-Orthodox spirit which pervades the Greek text of its oldest manuscript. There is a later text of the same type, the *Chronicle of the Tocco*, which celebrates the exploits of a family of Italian origin which ruled parts of the Ionian islands and Epirus in the early 14th century.

The *Erotokritos* of Vitsentzos Kornaros presents itself as a romance, a categorization that is uncontested. However, in this long poem there is also much that is heroic, and other epic characteristics (like the long parade of the champions in book 2), reminiscent of many epic catalogues. It is also plain that the choice of cities and areas from which the champions hail is made with care to represent a version of the thoughtworld of the mixed Venetian-Greek society of 17th-century Crete.

Primary epic has usually existed in close connection with the oral poetry of the area where it arises, and we must turn to Greek oral poetry of the late Turkish period, the first date at which it is possible to study surviving collected material. The chief tradition of the *demotika tragoudia*, the name by which Greek folk songs have come to be known, consists of short ballads, rarely exceeding 100 or so lines in length. Some of the most intense of these, as stated above, celebrate the klephts, the bandit freedom fighters who caused great troubles to the Turkish rulers of Greek lands and were to play a major role in the revolution of 1821. These are intensely heroic, but anti-epic in their brevity.

The prehistory of Greek folk song is, of course, a matter for speculation, for live oral traditions constantly change. This has not prevented a series of historians of Greek literature from linking a number of heroic ballads collected in the last two centuries with the epic romance *Digenis Akritis*, and calling them the Akritic Cycle. Jumping back half a millennium or more, these ballads have been judged in close proximity to the medieval poem, often as its source. As a result, it was once traditional to begin histories of modern Greek literature with a chapter on an epic cycle of Akritic ballads, most of the earliest surviving examples of which date from the 19th century. There are indeed many features which link these ballads to the world of Digenis, not least the appearance in some of them of the names Digenis and Akritis, though other names, like Konstantinos and Porphyrios, are just as common. But the medieval elements are combined with many later features, and the Akritic cycle certainly does not form a cohesive group. A few poems like the *Lay of Armouris* (which survives in a manuscript of similar date to the later of the medieval *Digenis Akritis* manuscripts) form a useful bridge between medieval literature and modern folk song. About most of the Akritic Cycle, however, though some distant relationship to the epic may be admitted, it is unwise to attempt precision over the nature of the connection.

At the margins of the ballads there survives a separate tradition of historical songs, chiefly found in the 20th century in Crete and Cyprus. It is tempting to link this tradition with a few post-Byzantine narrative poems with heroic themes, particularly that on Michael the Brave of Romania. One could make the hypothesis that these were imitations of oral narrative poetry, and trace the genre further back to the chronicles of *Tocco* and the *Morea*, which may well be in traditional Greek form in spite of their non-Greek stance. But this hypothetical narrative oral tradition, with its promise of an epic dimension, is as tenuous as the medieval Akritic Cycle of ballads.

When one turns from folk song to the written poems of the 19th century that are closest to the epic definition, two names stand out, Gerasimos Markoras and Athanasios Valaoritis. Both are among the demoticist successors of Solomos in the Ionian islands. Both take the brief form of the klephtic song and expand it, keeping the epic ideology and atmosphere. Markoras was inspired by the heroic self-sacrifice of the defenders of the Cretan monastery of Arkadi (1866) to write

the poem *The Oath*, a moving example of the genre. Valaoritis used this style for several poems, including *Athanasios Diakos*, a poem with a klephtic subject to match its style. Valaoritis's work is often regarded as more verbose and less successful than that of Markoras.

Greece ended the 19th century in the grip of the Great Idea, the desire to extend the kingdom to cover all areas where Greeks lived. This was at times combined with weak political leadership, leading to crises culminating in that of 1897, a humiliating defeat at the hands of the Ottoman empire. The resultant mixture of aspiration and shame was the motive which led Palamas to write his two great "epico-lyrical" poems *The Dodecalogue of the Gypsy* (1907) and *The King's Flute* (1910). Both poems link the Great Idea to Byzantium and both are in 12 sections, though only the second is in 15-syllable verse. The first makes the astonishing choice of a gypsy hero, who in the first half rejects the foundations of Greek civilization and in the second presides over their rebuilding in a radically new form. The Byzantine setting gives opportunities for prophecy of the degradation of the Greece of Palamas's time. The gypsy hero is able to examine Hellenism with a ruthless external eye, without special interests or preconceived ideas: his portrayal is clearly influenced by Nietzsche's Superman, though Marxist ideas are also present. The poem demands radical change, if Greece's politics are to fulfil the national purposes. The scope is certainly epic, but there is also a smaller-scale lyric dimension, assisted by a free and flexible metrical form, which provides most of the best moments. *The King's Flute* portrays Byzantium at the height of its glory, and narrates a symbolic journey made by the emperor Basil II from Constantinople to Athens, clearly foreshadowing the continuation of Hellenic Byzantine tradition in modern Greece. There are many opportunities to refer to and quote early poetry in modern Greek, and especially folk song. These literary echoes are in the end a significant anti-epic feature of the poem.

The Great Idea led to the Asia Minor disaster, and a need to rethink Greece's place in the world, within the universal ideological ferment which followed World War I. In the years between 1924 and 1938 Nikos Kazantzakis was writing his epic *Odyssey*, in which all the competing currents of the time and all the varied sides of the poet's complex personality and intellect play major roles. There are 24 books and 33,333 lines. The plot begins with Odysseus' return to Ithaca, and continues with his further travels, events which are too many and complex for summary here. The scale is cosmic, the narrative subordinated to the poem's profound philosophical dimension, the language full of abstract and extreme demoticist forms, and the initial impact rather bewildering for most readers. In fact it has often been said that, despite its obvious epic claims, the *Odyssey* is an intensely personal poem, reflecting not so much the tortured world between the wars as the tortured reaction to that world of its creator, whose personality holds together many disparate elements. The poem was well served by its translator Kimon Friar, who made it somewhat more accessible in English than in the original.

The problems of the same period were faced by George Seferis in a quite different way, though using some elements of the epic framework. His poem *Mythistorema* was composed in 24 units and makes constant reference to the Homeric stories. But each unit is only a few lines in length, and the narrative elements are fractured and distorted by various modernist techniques. Seferis obviously feels that this is as close to epic as his degenerate times could come.

Poetry, Lyric

Ancient

"Lyric" is a term commonly used to describe a wide range of Greek poetry; it is in fact applied to most poetic forms, excluding stichic hexameters and drama. The word itself suggests a more precise meaning: it is derived from *lyra* ("lyre"), and this indicates that lyric poetry was originally performed to the accompaniment of a stringed instrument, its range later being broadened to include iambic and elegiac poetry. The modern usage of the word can be imprecise. Lyric poetry was not considered a literary genre until the Hellenistic period; in early texts we occasionally find the word *melos* ("song"), and so "melic" is a convenient modern term often employed to designate lyric proper, although this obscures the fact that elegy also was sung. Greek lyric comprises both solo song (often called monody) and choral poetry, although it is unlikely that ancient scholars made this distinction. Apart from the victory odes of Pindar, no early Greek lyric poetry survives in an independent manuscript tradition, so that we are forced to work with fragmentary texts, some of which are preserved on lacunose (mutilated) pieces of papyrus and others quoted by later authors. Complete poems are all but nonexistent. Still, despite such incomplete evidence, considerable variety can be discerned in the extant lyric texts. These poems are characterized by elaborate metrical patterns, often organized in strophes consisting of three or four lines, sometimes in larger units of corresponding strophe and antistrophe followed by an epode of a different metrical character.

The performance of song can be imagined as taking place in a variety of settings, the performers being no doubt either soloists or communal groups. In the celebrated scene in the *Iliad* Achilles may be giving such a performance when he sings "the glorious deeds of men" while accompanying himself on the lyre (9. 186ff.), although that passage has regularly been understood as referring to heroic song in the epic tradition (the

songs of Demodocus in *Odyssey*, 8 are similar). The *Iliad* also mentions songs that are familiar from the later lyric tradition: the paean, most familiar as a hymn to Apollo (1. 472–73, 22. 391), the *threnos* or formal lament (24. 720ff.), the *ailinos* or dirge (18. 570), and the *hymenaios* or wedding song (18. 493). These songs are all rooted in the religious traditions of Greek communities, and cult seems to have constituted one of the commonest settings for the performance of song, and, perhaps more important, the religious context seems to have influenced the character and development of principal lyric genres. This is not to say that song was confined to sacred occasions; doubtless it featured in many secular settings too. Brief fragments of soldiers' marching songs (*Poetae Milici Graeci*, edited Page, 1962, frr. 856 and 857) and songs sung at work (*PMG*, fr. 869) suggest that Greek life was alive with song – in fact, early Greek society has been characterized as a "song culture".

Modern knowledge of Greek lyric begins in the 7th century BC, and the period from then down to the 5th century BC witnessed an extraordinary flowering of lyric; in fact, this period is often called the Lyric Age of Greece. It is sometimes said that lyric poetry was "invented" at this time, but there was clearly already a long tradition of popular song, and the preservation of poetry beginning in the 7th century BC no doubt coincides with the relatively recent introduction of writing and its use for recording poetry, a process that also brought about the preservation of the Homeric poems. These early lyric texts became the objects of considerable scholarly interest, first in the school of Aristotle, and later in the great library at Alexandria, where the texts of the central poets were edited and annotated. It is largely through the eyes of Hellenistic scholarship that we today view the fragmentary remains of the work of these poets, and we still make considerable use of that system of classification and categories, although it is clear that it imposed distinctions that obscure as well as clarify the issues. Perhaps the most pernicious is the rigid formal distinction between monody and choral song. Stesichorus and Pindar are classified as choral poets, and their surviving works have been seen to reflect a tradition of choral song that also stands behind the choral poetry of Greek drama; but recent discussion has challenged this view, and it now seems likely that this firm classification may be misleading, and that both monodic and choral performance were possible.

Working from the texts preserved in the library at Alexandria, scholars established a canon of nine lyric poets of the Archaic and Classical period. This list is avowedly selective, purporting to include only the finest exponents of lyric poetry, and we know incidentally of a number of lesser figures. Nevertheless the Alexandrian canon gives some impression of the character and range of the poetic activity in the early period. In chronological sequence, first comes Alcman, who was active in Sparta in the mid-7th century BC. He is best known from an extensive papyrus fragment containing a portion of a long *partheneion* ("maiden song"), a genre for which the poet was well known, in which a chorus of nubile young girls sing a song that strikingly combines both traditional myth and self-presentation at a local religious festival. Much remains teasingly uncertain, and we are reminded of how closely bound much of early Greek poetry was to the occasion for which it was intended. Next we encounter Alcaeus and Sappho, who both composed monody on the island of Lesbos and represent what was clearly a distinctive Aeolic tradition of song. Alcaeus' poems seem to have been sung against the backdrop of the political factions in Mytilene at the close of the 7th century BC. Sappho lived during the same period, and the remains of her work afford a tantalizing glimpse into the private world of young women as they prepared for marriage. Stesichorus was born in Himera, in the western part of the Greek world. He seems to have been a contemporary of the Lesbian poets, but the fragments of his work betray little of his world; he composed large-scale lyric treatments of traditional myth, and his strongest affinities seem to be with the epic tradition. It has generally been assumed on formal grounds that Stesichorus' poetry was choral, but recent scholarship has increasingly been inclined to see these poems as the products of a tradition of solo song. Ibycus and Anacreon both seem to have moved in the world of the tyrants of the 6th century BC, and we can gain from the extant passages of their poetry an arresting impression of the aristocratic symposium. Simonides of Ceos, his kinsman Bacchylides, and the Theban Pindar are the great lyric voices of the Classical age; they composed in an impressive range of genres, but it is the surviving victory odes by Pindar and Bacchylides that give us the clearest picture of their art.

The latter part of the Classical period witnessed the decline of lyric poetry. The bold experiments of dithyrambic poets of the "new music" led to the subordination of poetry to music. In the Hellenistic period changes in social organization seem to have led to a severing of that important connection between occasion (especially religious festivals) and specific poetic forms. Once free of the need to produce the familiar forms for traditional occasions, poets were able to reconsider the established genres and give them new expression. During this period the epigram emerged as a remarkably flexible form, and quickly became the favoured medium of small-scale poetic expression. Lyric poems, however, continued to be composed, although many seem to have been prompted by special occasions and there is little impression of a continuous tradition of lyric song. From the imperial period little survives of importance. The *Anacreontea*, a collection of poems written after the manner of Anacreon, are variable in quality, but exerted considerable influence on western poetry. More interesting is Hadrian's freedman, Mesomedes, who lived in the 2nd century AD. A collection of 13 poems survives in a manuscript tradition that also preserves musical notation for four of them; there are also two poems preserved in the *Palatine Anthology* (14. 63 and 16. 323). Mesomedes employed a number of metres and attempted to produce novel verbal effects and colouring in poems on a striking range of subjects.

Byzantine and Modern

Byzantine poetry is Christian poetry. Although educated men of the eastern Roman empire continued to display their erudition and training in the writing of Attic Greek on ancient (mythological or historical) themes, even they knew that their tradition was suffocating them. In fact the Greek language had played a crucial role in the diffusion of Christianity after 313 and slowly the simple style of the Septuagint and New Testament began to be used for poetry of religious feeling.

The pagan traditions were dealt a near-death blow when the emperor Justinian I closed the schools of Athens in 529, and so this is a good date to start calling Greek literature "Byzantine"; it lasted until 1453, when Constantinople fell to the Ottoman Turks. Classical mythology was supplanted by the rapidly developing Christian mythology, and Byzantine poetry, even of the most formal kind, could appeal to the average citizen, for whom religion was meat and drink.

The change of the metrical system from Classical quantity to modern stress and syllable count caused poets more trouble than changes in diction and grammar. Amazingly, the poems of the influential George of Pisidia observed both systems simultaneously; no wonder his production was limited. His most popular poem praised the victory of his patron, emperor Herakleios (610–41), over the Persians. Since George, the rhythm of spoken Greek has been the rule.

Formal Byzantine poetry took three main forms, all lyrical. In the 4th and 5th centuries short hymns, or *troparia*, were most popular. In the 6th and 7th centuries these yielded to long metrical sermons, called kontakia. And in the 8th and 9th centuries cycles of hymns, called canons, were the rule. Much religious poetry was set to music and it is poorer read silently on the page. Luckily, some of it, such as the magnificent *Akathistos* hymn (date unknown, but early) is still sung in church.

The greatest of the kontakia poets was Romanos the Melodist, possibly a converted Jew from Emesa, living in the 6th century. His music, now lost, was as renowned as his verses, which are lyrical, clear, rich in metaphor, and dramatic. But the flaws that make Byzantine poetry less popular than it deserves are evident in him: grandiloquence and love of size.

The canon, which usually consists of eight or nine long odes, did nothing to curb this inflation. Probably the greatest writer of canons was St John of Damascus (*fl.*730); deeply religious, he nevertheless revived Classical metres, perhaps because music was flooding the poetic tradition. Also important was Kassia (*fl.*840), Byzantium's only poetess. Her great poem on Mary Magdalene is sung for the evening of Tuesday in Holy Week. It concludes:

> who will trace out my multitude of sins and the abysses
> of thy judgements, my saviour of souls?
> Do not pass by thy slave
> in thy boundless mercy.

Symeon the New Theologian (949–1022) is often considered Byzantium's greatest poet after Romanos. Though overlong, his hymns are full of undoubted feeling. Symeon introduced the metre which now became the rule for 800 years. This is the so-called "political verse", a 15-syllable iambic line similar to the English fourteener. But after Symeon, it seems, there was nowhere to go.

Among the educated, the refined Hellenistic tradition maintained its appeal, and it still breathed in the epigram. The *Palatine Anthology*, comprising poems from the 1st century BC to the 10th century AD, was compiled in the 10th century and added to in the 14th. Poems worthy of their predecessors were composed by Agathias Scholasticus (536–82) and Paul the Silentiary (*fl.*563), and personal lyric poetry never vanished entirely. But after Symeon inner necessity in general gave way to rhetorical display.

The importance of anonymous folk poetry kept growing and came to a rich flowering during the Tourkokratia; because Ottoman domination forestalled the Renaissance and intellectual and religious development ceased, the common ancestral roots thrust deeper. Perhaps the earliest and most remarkable of these productions was the epic cycle *Digenis Akritis*, about a heroic Byzantine borderguard fighting the Saracens. The cycle's origins – before the 10th century – are lost in time, and many of its folk songs were not written down until the 19th century. After the Venetians conquered Constantinople in 1204, many popular verse romances were turned out. The folk poetry of Turkish Greece is extensive: love songs, satiric comments on politics, laments, imitations of foreign models, evocations of place, wrestlings with death, and much more: it is from this fertile loam that modern Greek poetry was waiting to spring. It needed only one more nutrient: freedom.

It might have started in Crete, which evaded Ottoman domination until 1669, and where higher education was in Italian. Vitsentzos Kornaros (1553–1617), who wrote Greek in Latin letters, composed a long romance, *Erotokritos*, that became for the Cretans what the *Iliad* was for Classical Greece; Cretan folk musicians perform it to this day. Though based on a French work, its diction is the most fluent, lyrical, and natural since the Hellenistic age. The ease and variety of the flow in strict metre and rhyme keep it fresh and delightful throughout its elaborate plot turnings. A medieval love story, it is full of wisdom:

> The Cycles with their circling paths that rise and fall aright;
> Time's Wheel that comprehends the Whole, from depth up
> to the height,
> And bears the whims of Destiny and never then turns back,
> But as it whirls all Good and Evil whirl within its track,
> The clanging clash of angry war, the spur of hate and spite,
> The rapturous embracing and the languorous kiss by
> night ...

Erotokritos remained Greece's national poem until Elytis' *Axion Esti*. Had the Turks not stifled this remarkable efflorescence (it includes poetic drama and El Greco), Cretan dialect might have prevailed.

Erotokritos, klephtic ballads, vigorous folk songs, heroic narratives, and freedom – something had to come of this. Dionysios Solomos (1798–1857), the father of modern Greek poetry, lived in Corfu, which was never under the Turks. Critics call the poets of the Heptanese, of whom he was chief, the School of the Ionian islands. Like his model Kornaros, he was educated in Italian; as an adult he learned to write Greek from Greece's first prime minister, Charilaos Trikoupis.

However imperfect, a more limpid Greek has never been written. It is no coincidence that his output coincided with the War of Independence of 1821. Though he never visited free Greece, its spirit suffuses his work much more than it does that of the Romantic poets of Constantinople, who relocated to form the Old School of Athens. The first stanzas of Solomos's *Ode to Liberty* are now the Greek national anthem, and his *The Free Besieged*, about the heroic resistance at Missolonghi, is often accounted the greatest modern Greek poem. His lines on the Turkish massacre of Chios rival Simonides.

On the deepblack ridge of Psara
Glory walking in solitude
meditates on the bright young heroes
and on her hair she wears a wreath
woven of the scanty grasses
remaining on that desolate land.

Solomos also introduced European metres new to Greek. Though his work is mostly fragments, every line has proved a seed for the future.

The new poetry was an adventure, but what were its influences, diction, forms, and themes? Like Solomos, whom he did not know, Andreas Kalvos (1792–1869) was educated in Italian, and lived for a while in Corfu; born in Zakynthos, he also lived in Italy, France, Switzerland, and England. He published only two books, of ten odes each, and they are so original that, though he was long neglected, modern poets continue to turn to him for a genuine exaltation of Greek; he devised one way to write Greek poetry when nobody was quite sure how to do it. His freedom from fixed metre helped too. As an imagist, Kalvos is supreme and startlingly original:

The circlechasing sun
enriches the sea
with the scent
of golden citrons

Elytis wrote of him: "He was – both for the uncompromising line of his life and for his original poetics – the only one who could be considered our distant forerunner."

Aristotle Valaoritis (1824–79) continued the values of the Ionian School. Rigorously demotic and exuberantly romantic, he had a deep and immediate influence, especially on the New School of Athens, which produced much enduring poetry. The New School, which dominated the later 19th century, made a conscious attempt to be both Parnassian and demotic, both classicist and folkloristic; it took the whole tradition of Greece for its subject. Though many fine poets wrote under its banner, its great figure was Kostis Palamas (1859–1943), who went beyond the parameters of the school in theme and time and whose funeral was a state affair. His huge output includes long poems (his masterpiece is *The Twelve Books of the Gypsy*), songs, meditations on philosophical, historical, and social themes, and critical works. His great poetry collection, *Life Immovable*, is both intensely lyrical and vigorously masculine. With Palamas we enter the 20th century, which has produced as much and as various first-rate Greek poetry as any.

Like Solomos and Kalvos, Constantine Cavafy (1863–1933) had imperfect Greek. He was born in Alexandria of a Constantinopolitan family, was educated mostly in England, and was not a Greek citizen. Spending his life as a minor official in Alexandria, he produced a small body of work that, for all its hard diffidence, first strikes the modern note, influencing dozens of modern writers. "I am not a Greek", he said, "but a Hellene." Though he clearly learned something from Robert Browning, he sounds like no previous poet; Seferis thought he got it from Suidas. If Solomos introduced a singing folk-like language, new themes, and high vigour, Cavafy was a dry, scholarly poet of the Greek diaspora, whose careful rhythms resemble prose and who, eschewing imagery (simile and metaphor) entirely, relies on direct statement. The notes of alienation, irony, and isolation later struck by Eliot and Seferis were first struck by him.

No new lands will you find, you'll find no other seas.
The city will follow you. To the same streets you will
turn again. And you will age in the same neighbourhoods;
and in these same houses you will grow grey.

W.H. Auden wrote that Cavafy had "a unique perspective on the world", and that perspective, though it carefully cherishes and builds on Hellenism, has travelled everywhere.

Influenced by French Symbolism and later Surrealism, modern Greek poetry developed rapidly in Athens; for all its being a tiny country, Greece has produced an extraordinary number of world-class poets. Although Seferis and Elytis – both recipients of the Nobel Prize for Literature – are deservedly the most famous, such fine poets as the suicidally gloomy Karyotakis (1896–1928), the exuberantly dithyrambic Sikelianos (1884–1951), and the imagistic and much-translated Ritsos (1909–90) are only the apex of an immense pyramid of poetic activity. And the novelist Kazantzakis wrote, among other works in verse, a frenzied philosophical continuation of the *Odyssey*, longer than the original. As with nearly all Greek writers, the care and passionate advocacy of the Greek language was of first importance to him.

The middle of the 20th century, during which Greece suffered so much from war and foreign occupation, was dominated by the diplomat-poet George Seferis (1900–71), a symbolist who, through essays, translation, and his own masterpiece *Mythistorema* (1935), brought T.S. Eliot's influence into Greek. Overburdened with exile and hopelessness, Seferis's poetic protagonist continually finds salvation in aesthetic values:

We brought back
these carved reliefs of a humble art.

A very erudite man, constantly wrestling with his heritage, he wrote the leanest Greek of all, and helped fix its Protean slipperiness.

Where Seferis was chaste in diction, pessimistic in theme, ironic and allusive in tone, and faint in rhythm, Odysseus Elytis (1911–96), for all his craft, seems to be overflowing with Greece, its eros, landscapes, traditions, language. His book-long poem, *Axion Esti*, especially as set to music by Theodorakis, has helped Greeks to engage their tradition as a living organism. Although Elytis is full of the Aegean – its islands, girls, skies, depths, flora – he also wrote about the war, about history, about childhood, about love. In his long career he kept experimenting, writing mostly in free verse, but also in various species of closed measures, in slang, in formal diction – he changed strategy with every book. So great was his presence that today's young poets have had to avert their eyes from him for a long while before yielding. A song from his *Axion*

Esti has become for Greeks an anthem of independence and is the best-known contemporary poem:

*A solitary swallow * and Spring's great worth is found*
*It takes a lot of work * to make the sun turn round*
*Their shoulders to the Wheels * it takes a thousand dead*
*It also takes the living * to offer up their blood.*

*God my greatest Masterworker * high in the mountains*
You built me
*God my greatest Masterworker * You have surrounded*
me with sea!

Sensuous in his youth, in old age he wrote profound meditations on death.

Throughout the Byzantine and modern periods – some 1500 years – Greece produced little dramatic or satiric verse of value. But the fount of lyricism has never ceased flowing, and an astonishingly prolific record of a people's and a language's intense joys and sorrows remains for us to read for ever.

Political History to 490 BC

Although a preoccupation with defining personal and collective relationships both within and between communities can be assumed to date back at least as far as the Neolithic period, the current state of knowledge makes it impossible to write a coherent political "prehistory" of Greece prior to the emergence of the polis (city state). While archives of Linear B tablets are now known from Mycenae, Tiryns, Midea, Thebes, Pylos, Knossos, and Chania, they are chiefly administrative records and inventories of commodities stored in the palaces; no texts have yet emerged that parallel the royal decrees and diplomatic documents of the Near East. What is known is that the Mycenaean palaces employed large workforces of specialized labourers (including slaves) dominated by an administrative hierarchy under a *wa-na-ka*, sometimes assisted by a *ra-wa-ke-ta*. The Pylos tablets reveal that the "kingdom" of Pylos was divided into two provinces, governed by a *da-mo-ko-ro* and a *du-ma*, and that each province was further subdivided into districts under the authority of a *ko-re-te* who was assisted by a *po-ro-ko-re-te*. Nothing is recorded about the relationships that existed between palatial centres, though a recent tablet from Thebes appears to attest the presence of a Lacedaemonian.

Even less is known about the succeeding Dark Age due to the complete absence of literary material prior to the adoption of the Phoenician alphabet in the 8th century BC. Inferences for this period are largely based on archaeological investigation or analysis of institutional forms and social structures in the Homeric epics (though there is considerable debate as to whether Homeric society is in any sense historical and, if so, whether it reflects the social and political conditions of the Dark Age, the 8th century, the 7th century, or an amalgam of each). Scholarly opinion is divided as to whether Dark Age society was predominantly hierarchical or egalitarian and whether the communities of this period were subject to individuals whose authority derived from personal charisma and social standing or – as the Homeric poems and later political theorists suggest – to hereditary monarchies. Consensus remains elusive, though recent interpretations of the archaeological evidence incline towards the view that Dark Age communities were not as small as previously assumed and may have been characterized by a weak form of ranking, though

political leadership was probably an achieved rather than ascribed status.

The political history of Archaic Greece is essentially the history of the polis (plural: poleis), though in western Greece the prevailing form of organization was the *ethnos* – a large territorial entity characterized by scattered settlement and loose "federal" ties between communities, particularly in the religious and military domains. The word polis is conventionally translated as "city state" to indicate its dual status as both (1) an urban centre housing a single, unitary decision-making body whose authority extends over not only the settlement itself but also the surrounding territory (including second-order habitation sites) and (2) a community of citizens, fully enfranchised or not, who are entitled to own property within the territory of the polis and whose citizen status is predicated on either agnatic (patrilineal) descent from a citizen or a grant of citizenship from the central authority. While some possible continuities with features of the Mycenaean states cannot entirely be discounted and although poleis continued to be founded throughout the whole period of Greek antiquity, the crucial era for the formation of this type of organization would appear to be the 8th century BC. Archaeological evidence in particular indicates that this was a time of increasing settlement nucleation – perhaps accompanied by a more sedentary way of life and demographic increase which would itself necessitate a greater division of labour and specialization – as well as of a new preoccupation with defining territoriality through the foundation of sanctuaries in both urban settings and marginal rural areas.

The 8th century also witnessed the commencement of colonization of areas outside the Aegean and a symbiotic relationship has been posited between this and the emergence of the polis. The processes of social exclusion through which the polis was forged may have created a new group of outsiders who

decided to form communities overseas, but the immediate imperatives of colonial foundation – settlement planning, allotment of land, and procedures for decision making – probably exerted a feedback effect on the communities of the Greek mainland.

The rise of the polis should not be confused with the advent of democracy (the Athenian democracy hardly predates the reforms of Cleisthenes at the end of the 6th century BC, or in its more familiar "radical" form the measures undertaken by Ephialtes and Pericles in the middle of the 5th century) and ultimate authority in the poleis of the Archaic period invariably rested with the elite. The provisions of the Spartan "Great Rhetra" (conventionally – though not uncontroversially – dated to the mid-7th century BC) imply that deliberation and the right of veto lay with the two kings and their advisory council of 28 elders, drawn from the wealthier families, while the function of the popular assembly was merely to accede to the motions placed before it. A law from the temple of Apollo at Cretan Dreros, dated to 650–600 BC and stipulating that the office of kosmos could not be held by the same individual twice within a ten-year period, makes it clear that the function of early legislation was concerned less with defining rights and privileges within the citizen body as a whole than it was with regulating the distribution of power within the elite classes.

The word demos, which in democracies of the Classical period signified the entire citizen body, is in this period employed to denote those who are not of elite status, and the poetry of Hesiod, Theognis, and Solon testifies to a sharp division between elite and non-elite groups as well as to the growing importance of wealth (as opposed to birth) in recruitment to the governing classes. One of the many grievances which the demos held against the "bribe-devouring lords" who governed them (Hesiod, *Works and Days*, 38–39) appears to have been the fact that there was no clearcut dividing line between poor citizens and slaves: among the social problems that the Athenian statesman Solon had to address in the early 6th century BC was the practice whereby poorer citizens took out loans on the security of their person, risking enslavement in the event of default.

From the 7th century BC onwards certain members of the elite recognized that popular discontent could be mobilized for political ends and appealed to the demos for support against their rivals in establishing tyrannical regimes (the thesis that tyrannies emerged as a result of a sudden radical reorganization of military equipment and tactics – the so-called "hoplite reform" – is less religiously held today). The earliest tyrannies are attested in the area of the Corinthian isthmus: at Corinth itself Cypselus seized power *c.*655 BC; at about the same time Orthagoras gained control at Sicyon; and at Megara Theagenes established a tyranny *c.*640 BC. Towards the end of the 7th century, tyrannies were established at Mytilene on the island of Lesbos and Miletus on the coast of Asia Minor and in the middle of the 6th century Polycrates seized power on the island of Samos. A tyranny is attributed to Pheidon at Argos, though dates for this enigmatic figure range from the 8th to the 6th century BC. About 630 BC Theagenes of Megara assisted his son-in-law Cylon in a coup at Athens, but the attempt was unsuccessful and Athens remained free from tyranny until *c.*546 BC when, on his third attempt, Pisistratus established himself as tyrant. The reason for Cylon's failure and Pisistratus' two failed attempts is probably that the vast and differentiated territory of Attica militated against any unified sentiments of collective consciousness among the Athenian demos (Pisistratus' eventual success was achieved through a mercenary force rather than the support of the demos). Popular support for tyrannical regimes was often shortlived as rival elite claimants also joined in courting the favour of the demos. Alternatively, elite factions might call upon outside help: the Spartan expulsion of Pisistratus' son Hippias in 510 BC was reputedly instigated by the wealthy Athenian family of the Alcmeonidae.

Relationships between poleis in the early Archaic period are characterized by the counteracting tendencies of aggregation and competition and conducted mainly at the level of the elite – the majority of citizens constituted a landbound peasantry whose horizons rarely exceeded the territorial limits of the polis, though specialist craftsmen, merchants, and mercenaries would often seek employment in other (Greek and non-Greek) cities. The elite classes maintained more cosmopolitan networks of support through guest friendships (*xenia*) and intermarriage (*epigamia*). This policy is demonstrated most clearly by the tyrants: guest friendships existed between Pisistratus and Lygdamis of Naxos (Herodotus, 1. 61), between Periander of Corinth and Thrasybulus of Miletus (Herodotus, 1. 20), and between Polycrates of Samos and Amasis, pharaoh of Egypt (Herodotus, 2. 182), while intermarriage guaranteed bonds of friendship between Periander and Procles of Epidaurus (Herodotus, 3. 50) and Theagenes and Cylon (Thucydides, 1. 126). The practice was not, however, limited to the tyrants alone: Isagoras, the Athenian archon (chief magistrate) for 508/07 BC, was a guest friend of the Spartan king Cleomenes (Herodotus, 5. 70); the Athenian Alcmeonidae contracted a guest friendship with King Croesus of Lydia (Herodotus, 6. 125); and among suitors from the most important families of Greece, it was the Alcmeonid Megacles who won the hand of Agariste, daughter of the Sicyonian tyrant Cleisthenes (Herodotus, 6. 130).

Aside from forging bonds of friendship, the elites also competed among themselves to win *kleos* (repute) and *kudos*. Archaeological evidence from Olympia indicates that the origins of the sanctuary date back to the 10th or even 11th century BC, long before the formal institution of the Olympic Games (traditionally dated to 776 BC), and that the sanctuary originally served as an arena for competitive display through the dedication and circulation of prestige goods. Such conspicuous consumption served to assert an individual's status in the eyes of his peers as well as to guarantee his authority in his home community.

In the 6th century BC, however, elite habits came to be increasingly integrated within the more collective framework of the polis. The practice of contracting individual guest friendships was usurped and institutionalized at a civic level by appointing an official *proxenos* ("consul") in another city (a Locrian is already described as a *proxenos* of Corfu on a limestone cenotaph dated to 625–600 BC). New regulations regarding *epigamia* stipulated the communities into which one might marry, and the glory that individuals won in agonistic competitions at the Panhellenic sanctuaries of Olympia, Delphi, Isthmia, and Nemea was now redirected to reflect credit on the victor's polis. Cities, alongside individuals, vied with one

another to dedicate expensive offerings and treasury buildings at the most important sanctuaries of Greece. These shared cult places provided a locus for the proclamation of common bonds between Greek cities, but it was those perceived commonalities that provided a defined framework for poleis to publicize not only their parity but also their distinct identities.

Warfare was simply a more violent manifestation of this agonistic spirit which employed shared rules and ritualized norms within which poleis might assert their independent identities. One of the earliest wars of which we hear is the Lelantine War fought between the neighbouring Euboean cities of Eretria and Chalcis, probably towards the beginning of the 7th century BC. Thucydides (1. 15) asserts that the rest of the Hellenic world participated in the conflict through alliances with one of the main protagonists, and isolated notices from Hesiod, Archilochus, Theognis, Herodotus, Plutarch, and Strabo have been ingeniously marshalled to draw a picture of a conflict between two massive trading leagues; in reality, however, it is far from clear that each of the sources refers to the same war and it is more likely that the story of an original conflict between two neighbouring cities was exaggerated over time by a tradition that cast the Lelantine War in similar terms to the Trojan War. Certainly wars in the Archaic period generally involved powerful neighbours – for instance, the mid-6th-century "Battle of the Fetters" between Sparta and Tegea (Herodotus, 1. 66) or the long-running dispute between Argos and Sparta over the Cynourian region of the Peloponnese, which may already have run intermittently for about a century by the time of the mid-6th century when each side put forward 300 picked men to fight a "Battle of Champions" (Herodotus, 1. 82). Warfare in this period required the preselection of a time and place (generally a level plain) at which two armies of citizen hoplites (heavy infantry) confronted one another; in conforming to prescribed rules and rites both as preliminaries to the battle and in the conduct of the battle itself, hoplite armies played out a regulated (if lethal) game to determine which city was the victor.

Polis autonomy was also guaranteed within the leagues and amphictionies ("dwellers around") that are said to have emerged during the Archaic period. Though its origins are hazy, one of the earliest is said to have been the amphictiony of central Greek states, organized around the sanctuary of Demeter at Anthela, which is thought to have been the predecessor of the Delphic Amphictiony charged with administering the sanctuary of Pythian Apollo. Strabo (8. 6. 14) refers to a Calaurian amphictiony, centred on the sanctuary of Poseidon on Calauria (modern Poros) and including the cities of Hermione, Epidaurus, Aegina, Athens, Prasiae, Nauplia, Orchomenus, and, later, Sparta and Argos, though there is no independent testimony for this amphictiony prior to the Hellenistic period. By the beginning of the 6th century, if not earlier, six Dorian cities in Asia Minor had organized themselves into a league (the Dorian Hexapolis) centred on the sanctuary of Apollo Triopios near Cnidus, while 12 Ionian cities constituted a similar federation (the Ionian Dodecapolis) focused on the sanctuary of Poseidon Heliconius at Mycale. Towards the end of the 6th century BC Sparta created a new hegemonic Peloponnesian league in which allies were required to follow wherever Sparta led by land or sea.

It is likely that an increase in the incidence of hostilities between poleis, together with the need to field larger citizen armies, contributed to growing calls for a broader base of political inclusion. An inscription from the island of Chios attests to a "popular council" (as opposed to an aristocratic council) by 575–550 BC, and a few decades earlier the Athenian Solon is said to have established a new probouleutic council (*boule*) of 400 which coexisted with the aristocratic council of the Areopagus, though it is unclear exactly how powerful this council was prior to its reconstitution as the Council of 500 under Cleisthenes in the last decade of the 6th century and the reorganization of the Areopagus under Ephialtes in the 460s. Solon also established the right of appeal to popular jury courts and formalized the admission of the lowest property class of Athenian citizens (the *thetes*) to the popular assembly, though the aristocracy continued to exert considerable influence – particularly in rural areas – until Cleisthenes engineered a radical reorganization of the citizen body into demes distributed among ten new tribes.

The rise of Lydia and especially Persia in the 6th century BC had profound consequences for the cities of eastern Greece. By 546 the cities of Colophon, Magnesia, Smyrna, and Ephesus had fallen to the Lydians, and following the defeat of Croesus of Lydia the Greek cities of Asia Minor became the possession of the Persian king Cyrus the Great. In about 520 Cyrus' successor Darius I assessed the cities for tribute within the new satrapies that he had established and launched attacks on the islands of the Aegean as well as advancing into Thrace, where he accepted the submission of the Macedonian king Amyntas *c.*500 BC. In 499 the Ionians initiated their ill-fated revolt from Persian dominion, and Herodotus (5. 97) argues that it was the support afforded the Ionian rebels by Athens and Eretria on this occasion that provoked Darius' successful assault of Eretria and unsuccessful landing at Marathon in 490. The Athenian victory against overwhelming forces at Marathon served as a key founding-myth of Athenian identity throughout the 5th and 4th centuries BC.

Political History 490–323 BC

The immediate effect of the Athenian victory at Marathon was to prompt Darius' son Xerxes to launch a new and greater invasion in 480 BC. His force, incorporating various Greek contingents including the Thebans, was repulsed by the Greeks, under the hegemony of the Spartans but without the Argives, in the battles of Artemisium, Salamis (both 480), Plataea, and Mycale (both 479). These victories, and the glorious defeat at Thermopylae (where the fighting on land coincided with the naval battle at Artemisium), were of utmost importance in the fostering of Greek self-belief and were commemorated in verse, prose, art, and architecture for centuries afterwards. But they are also indicative of two of the major themes of Greek history in the 5th and 4th centuries BC: the persistent external threat posed to the Greeks by the Persian empire, and the constant internal, interstate rivalries which served to undermine Greek political stability.

Athens was the first state to assert this new-found confidence, when the Spartans withdrew from the command of the Greek forces in 487. The Spartan king Pausanias captured Byzantium, but his arrogant behaviour led to his recall to Sparta. A new alliance was formed, comprising the Ionian states, most of the Aegean islands, and cities of the Hellespont and Propontis regions, with a base on Apollo's island of Delos (hence the modern title "Delian League") and under the leadership of Athens, which claimed to be the Ionians' mother city. Delos housed the treasury of the league, to which most of the members paid an annual tribute (others, most notably Chios, Lesbos, and Samos, provided ships). The history of the *pentekontaetia* (roughly the 50-year period 480–430 BC) is dominated by the Athenians' increasing hold on the Delian League and its transformation into an Athenian empire, and the largely ineffectual opposition to Athens by the Spartans and their allies (loosely termed the Peloponnesian League). Although the early campaigns of the league were aimed at dislodging the Persians from western Asia Minor, culminating in the Athenian general Cimon's victory at the river Eurymedon (466), almost from the start Athenian ambitions were barely disguised. Cimon's coercion of Skyros (*c.*475) was followed by that of Carystus in Euboea (*c.*472), Naxos was forcibly prevented from seceding (*c.*467), and Thasos was harshly dealt with after revolting in protest against Athenian interference in Thasos' mainland possessions (465). Athenian confidence was further fuelled by the development of the democracy. Cleisthenes' democratic reforms of 508/07 BC were buttressed by the rising importance of the board of ten elected generals at the expense of the archons, and by the reforms of Ephialtes in 462, in which the powers of the Areopagus were divided between the assembly, the council, and the law courts. Soon after, Pericles introduced pay for the jurors and members of the council, and in 451 he passed a law which restricted citizenship to those who were the legitimate sons of an Athenian mother as well as father.

The Spartans, meanwhile, were unable to check the expansion of Athens. Although the threat of Argos, Sparta's main rival in the Peloponnese, had been crushed in 494, internal problems with the Arcadians were followed by a serious helot revolt after an earthquake *c.*465. Cimon led a force of Athenians to assist the Spartans, but in his absence Ephialtes passed his reforms and Cimon was dismissed. After subduing the revolt, Sparta finally took action to secure its interests in central Greece, but Athens' main opponents during the First Peloponnesian War (*c.*461–446) were the Corinthians. Corinthian aggression led Megara to leave the Peloponnesian League and side with Athens, and Corinth suffered heavy losses in the early stages of the war. Athenian power now reached its peak in Greece and the Aegean under the leadership of Pericles: Aegina was forced into the league (458), and after an initial defeat at Tanagra had been reversed at Oenophyta, Boeotia came under Athenian control (457–446). The Athenians were confident enough to pursue war on two fronts, dispatching an expedition to Cyprus in 460 which was sent on to Egypt to support Inarus' revolt against Persia, but this force was destroyed in 454. The league treasury was subsequently transferred from Delos to Athens, and the Peace of Callias was concluded with the Persians in 450, ending open hostilities until 413 (it is not quite certain that a formal peace was made). Back in Greece, the war ended in 446 as Boeotia revolted and the Athenians were defeated at Coronea. Megara returned to the Spartan fold and was used as the base for a Spartan invasion of Attica, and Euboea also rebelled. The Thirty Years' Peace was concluded, by which Athens lost control of Boeotia (whose major cities formed the Boeotian Confederacy) and other recent acquisitions, and which satisfied the Corinthians, who prevented Peloponnesian intervention against the Athenians when Samos revolted in 440. The peace held until 431, despite continued Athenian expansionism (e.g. the establishment in 437–436 of the strategically important colony of Amphipolis on the east bank of the river Strymon) and increasing oppression of the allies, especially by means of cleruchies (settlements on conquered territory). But in Thucydides' view war was inevitable, and in his opinion Spartan fear of the growth of Athenian power was the truest cause of the outbreak of the main Peloponnesian War (431–404). It was precipitated by a series of grievances among Sparta's allies, including the Athenian alliance with Corfu against Corinth (433), the Megarian Decree (?432), which restricted access to the Athenian agora and to harbours of the Athenian empire, and Aeginetan complaints that their autonomy under the terms of the peace had been infringed. The Spartans and the Peloponnesians now attempted to liberate Greece from Athenian domination, but the first ten years (the Archidamian War) resulted in stalemate and the Peace of Nicias (421). On the resumption of hostilities Athens suffered various setbacks, including the disastrous failure of the great expedition to Sicily (415–413), the subsequent secessions of Chios, Miletus, Thasos, and Euboea, the renewal of Persian interference in Greek affairs (413) and their commitment to the Spartans (407), and the temporary overthrow of the democracy by the oligarchy of the Four Hundred (411). Nevertheless, the fighting continued (the Ionian War) with some notable Athenian successes until they were finally defeated at Aegospotami (405). Persian money was no small influence here. The city itself fell in 404, and the Spartans installed the shortlived and hated regime of the Thirty Tyrants (404–403).

Sparta's victory in the Peloponnesian War, far from curtailing hostilities, was only the beginning of a series of struggles in the 4th century, as various states in turn asserted their claim to supremacy and were overthrown. The victorious Spartan

32. The Second Athenian Confederacy, 377–355 BC

general, Lysander, quickly made himself and his country unpopular with his policy of establishing oligarchic decarchies in numerous cities, and fear of Sparta's expansionist policies in Asia Minor, central and northern Greece, and the west led to the Corinthian War (395–386). Athens, with a restored but less radical democracy, had recovered remarkably from defeat and now joined in an anti-Spartan alliance with Thebes (which had gained control of the Boeotian Confederacy during the Peloponnesian War, but had fallen out with Sparta and received Athenian democratic exiles during the rule of the tyrants), Corinth (whose relations with Sparta had also deteriorated in 404 when the Spartans refused to destroy the defeated Athens), Argos (Sparta's old enemy), and Persia (reversing the former alliance). The Athenian Conon led a Persian-sponsored fleet to victory at Cnidus (394), but despite much fighting around Corinth the allies were unable to inflict a fatal reverse on the Spartans and the war was ended by the King's Peace. This treaty, negotiated by the Spartan Antalcidas and imposed by King Artaxerxes II, guaranteed the Greeks' autonomy, but in exchange for Persian control of the cities of Asia, Clazomenae, and Cyprus. The peace had the additional effect of strengthening Sparta's position in central and northern Greece, enabling the coercion of Olynthus and dissolution of the Chalcidian Confederacy. The Boeotian Confederacy was also dismantled, but the Spartans, whose king Agesilaus II was implacably hostile to Thebes, went too far in occupying the Theban acropolis, the Cadmea (382), which the Athenians helped liberate in 379. Thebes subsequently joined the Second Athenian Confederacy (378), which was formed to ensure the Spartans' compliance with the terms of the King's Peace. Athens was careful not to repeat the mistakes of the 5th-century empire, guaranteeing no internal political interference or tribute, and membership grew rapidly in the period 378–373. But so too did Theban power, as it re-established the Boeotian Confederacy under Theban control, and the Spartans' military dominance was ended for good at the Battle of Leuctra (371). A decline in the number of full Spartan citizens (*homoioi*) had set in during the 5th century, as changes in

the pattern of landholding deprived many Spartans of the ability to contribute to the common messes on which their citizenship depended. Now Athens and Sparta were forced to forget past differences and unite in opposition to Thebes, which tried to supplant Athens at sea and to undermine Sparta's position in the Peloponnese by the foundation of Megalopolis in Arcadia (*c.*370–367) and Messene in Messenia (369). While the Peloponnesian League finally collapsed (366), the Thebans, led by Epaminondas and Pelopidas, enjoyed a brief period of hegemony, which ended with Epaminondas' death at the Battle of Mantinea (362).

One other major player in the 370s was Jason, the tyrant of Pherae in Thessaly, who made an alliance with Thebes after 375, captured Pharsalus (375/4), and became *tagos* (supreme magistrate of Thessaly). His unification of Thessaly provoked Phocis (373–371), but he went on to gain control of Perrhaebia and was planning a Persian invasion when he was assassinated (370).

Athens, meanwhile, was beginning to return to its old ways. Attempts to recover Amphipolis (from 368), which had surrendered to the Spartan general Brasidas in 424 and had since remained independent, the installation of cleruchies, especially that in Samos (366), and increasing political and judicial interference in confederate states made the Second Athenian Confederacy unpopular; and eventually Byzantium, Chios, and Rhodes rebelled in the Social War (357–355). Athens and Sparta also became involved in the Third Sacred War, backing Phocis against the Delphic amphictiony (355). All the time a new threat to Greek independence was growing, as Philip II of Macedon (ruled 359–336) first consolidated his position and then began expanding his kingdom. Amphipolis was captured in 357 while Athens was involved in the Social War, other northern Greek states were annexed, and Philip secured Thessaly in 352. Athens finally began to wake up to the threat, and opposition to Philip was promoted by Demosthenes. It was too late, however, to save Olynthus (349–348), and without Greek support the Athenians were forced to negotiate the Peace of Philocrates (346). Before ratifying the treaty Philip accepted the invitation of the Delphic amphictiony to lead resistance to Phocis, which was destroyed. Further expansion in Illyria and Thrace, and the besieging of Perinthus and Byzantium, delayed the final attack on Greece, which culminated in the destruction of the Theban, Corinthian, and Athenian forces at Chaeronea (338). This was the end of Greek political independence: the League of Corinth was formed the next summer (337) with a common peace which provided for the autonomy of member states, prohibited constitutional change, and put Philip at the head of the governing council (*synedrion*). At the foundation meeting Philip announced his plan to invade Persia, but he was assassinated before he could carry it out (336).

Philip's successor was Alexander III the Great, who accomplished his father's plan in a series of brilliant campaigns (334–323). Before departing on his great expedition Alexander made a show of strength in southern Greece, and when Thebes revolted during Alexander's campaign on the Danube, he returned to destroy the city and enslave its inhabitants (335). Alexander left Greece under the control of Antipater, who crushed a Spartan rebellion led by Agis III, supported by Elis, Tegea, and the Achaean Confederacy (331). Athens refused to support Agis and remained subdued in the 330s and 320s, its leading politician being Lycurgus. He was responsible for re-establishing the city's finances, increasing the navy, and a rebuilding programme, which included an arsenal, docks, and the theatre of Dionysus. Alexander's death sparked the struggles of the successors and in the Greek sphere the Lamian War (323–322), in which a coalition led by the Athenians and Aetolians was almost successful. But the crushing defeat at Crannon resulted in the suppression of the Athenian democracy by Antipater, which was temporarily restored in 318 by Polyperchon before the tyrannical rule of Demetrius of Phalerum (318–307).

The momentous struggles of mainland and eastern Greece in the 5th and 4th centuries should not be allowed to overshadow the events in the western Greek world, in Sicily and southern Italy. Here too the Greek communities faced the double threat of external powers and internal rivalries. Those in Italy had local, indigenous rivals (e.g. the Messapians massacred the Greek Tarentines *c.*470), as well as the major power of the Etruscans; while those in Sicily faced the threat of the Carthaginians. The main western Greek state was Syracuse, whose power rose greatly under Gelon, the tyrant of Gela, who seized Syracuse in 485 (his brother Hieron becoming tyrant of Gela). He was prevented from helping the mainland Greeks in 480 by the Carthaginian Hamilcar's invasion of Sicily, but won a crushing victory at Himera. Gelon was succeeded in 478/77 by Hieron, who defeated the Etruscans in a naval battle with the help of Cumae (474). Democracy was restored after Hieron's death (466), but Syracuse became involved in wars with another leading Sicilian state, Acragas, and with the Sicels, who under Ducetius defeated the joint forces of Syracuse and Acragas in 451. Ducetius himself was in turn defeated by the Syracusans in 450 and exiled, but returned to found the colony of Caleacte, which resulted in another war between Syracuse and Acragas. Syracusan victory was later followed by successes against Athens (427–424, 415–413), but further interference by the Carthaginians resulted in the destruction of Himera and other cities (409). The democracy was overthrown in 406 by Dionysius I, who fought four wars against the Carthaginians and extended Syracusan power over most of Sicily and much of southern Italy. He died in 367 and his successor, his eldest son Dionysius II, was opposed by Dion (356) in a civil war which was ended by the intervention of the Corinthian Timoleon on behalf of exiled opponents of Dionysius. Timoleon put down tyranny in Sicily, defeated the Carthaginians (341), and re-established stable government, but after his retirement (*c.*336) an oligarchic government was installed until Agathocles became tyrant (317) and once again subdued most of Sicily.

Political History 323–31 BC

The chaos resulting from the unexpected death of Alexander III the Great in Babylon in 323 BC lasted for several decades before the establishment of the three major Hellenistic Greek kingdoms which form the focus of the history of the next three centuries. The kingship fell jointly to the son and half-brother of Alexander, the satrapal appointments were rearranged, and the successors (the name traditionally used for Alexander's generals) fought each other and jockeyed for positions of ever greater power. Some were killed early on in this power struggle, and successive regents of the two kings died. The kings were returned to mainland Greece (which in effect signalled the end of Alexander's Asian empire) where they became pawns in the hands of those seeking to establish mastery over Macedonia and Greece, and the remaining successors continued to fight each other in Asia Minor.

It was probably inevitable that both kings would be murdered, as also were eventually all the immediate members of Alexander the Great's family, thereby extinguishing the Argead dynasty of kings of Macedonia (to which Alexander and his father Philip II belonged). In 306–305 BC the surviving successors assumed the title of "king", thus acknowledging finally that Alexander's kingdom was now split among several rulers even if they did not yet have fixed geographical kingdoms. A major landmark of this period was the Battle of Ipsus (in Phrygia) in 301 BC, in which the Macedonian general Antigonus the One-Eyed was defeated and killed by a coalition of the other successors, who divided the spoils of the territories he controlled among themselves.

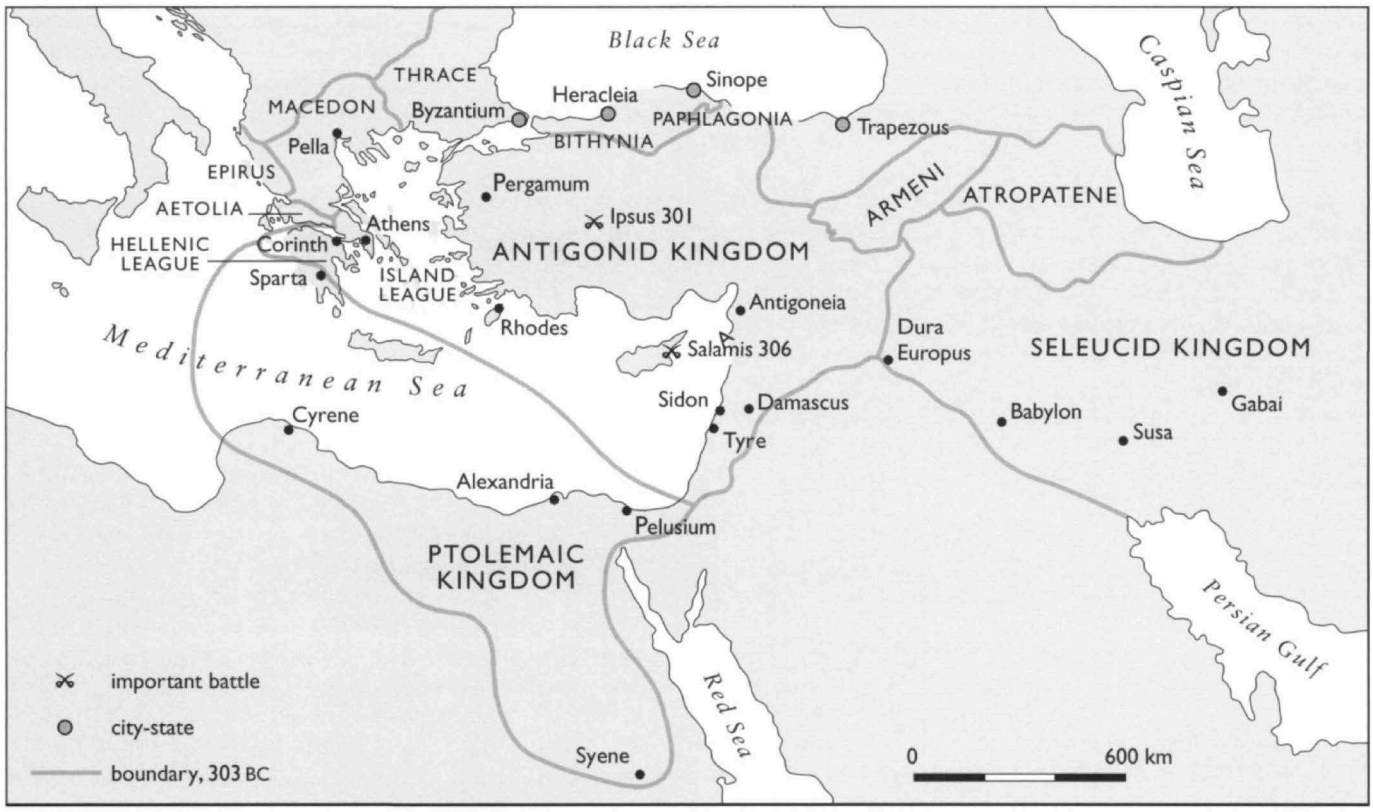
Antigonus' ambitious son Demetrius (known as Poliorcetes, "the Besieger", because of his siege of Rhodes in 305/04 BC) unsuccessfully tried to re-establish his father's Asian empire while also intervening in Greece. It was only when his son Antigonus Gonatas securely established himself on the throne of Macedon in 277/76 BC that the Antigonid dynasty of kings of Macedon was created.

Third-century Macedonian history is characterized by warfare on the northwestern borders with Illyria and by attempts to control mainland Greece by both diplomacy and guile. Judging from the low numbers of Macedonian troops recorded in various encounters, it appears that the country suffered the effects of severe depopulation as a result of Alexander the Great's removal of some 40,000 men in their prime in the 4th century BC. Finally, in 229 BC, the accession to the throne of the boy king Philip V under the care of a regent left the country potentially vulnerable. When he assumed control in his own name in 221, Philip unwisely thought that he could prevail against the growing power of Rome, whose suspicions about Greece were becoming ever stronger. Three Macedonian Wars were fought, leading to Philip's defeat at Cynoscephalae in 197, and to his son Perseus' even more catastrophic defeat at Pydna in 168. After Pydna, Macedonia was ruthlessly sacked and the kingship abolished. The region became a full province of Rome in 146 BC.

Mainland Greece suffered various vicissitudes during this period. Athens, usually under Macedonian control, was constantly split between pro- and anti-Macedonian factions and experienced severe internal political stasis. A major revolt against Macedonia is attested in 287 BC, and the Chremonidean War in the 260s signalled the final unsuccessful attempt of Athens (this time allied to Sparta) to overthrow the Macedonian yoke. A Macedonian garrison was imposed, Macedonian officers were installed in Athenian political posts, and the activity of the Assembly was curtailed. This was a severe humiliation to a city which was the birthplace of Greek democracy. Athens became politically unimportant after this period, but remained culturally pre-eminent, even if eclipsed by the new Greek city Alexandria in Egypt. During the next centuries many notable figures of both Greek and Roman origin came to study in Athenian philosophical and rhetorical schools.

During this period politics in the Peloponnese revolved around the Achaean League (a powerful federation of Peloponnesian cities), a stubbornly independent Sparta, the interference of both Macedonia and Rome, and the attempts of the league to manipulate all parties to its advantage. Despite some flirtations with social and economic reform in the 3rd century, Sparta was finally forcibly united with the Achaean League in 192 BC, which was in turn defeated by Rome in 146 BC. The Greek city of Corinth was sacked with a savagery which shocked the Greek world. The region was first incorporated into the Roman province of Macedonia but became the separate province of Achaea under the Roman empire.

Events in mainland Greece in the Hellenistic period arguably take second place to events in the new Greek kingdoms established in Asia after the wars of the successors. Ptolemy, a Macedonian general of Alexander the Great, received the satrapy of Egypt after Alexander's death and developed it into a wealthy and powerful kingdom to be ruled



33. The successor kingdoms to Alexander's empire

by himself and his descendants. Being content with Egypt, Ptolemy wisely avoided any temptation to extend his territory at the expense of the other successors, but he displayed a defensive strategy by establishing control over nearby Cyprus and Cyrenaica (a large region in modern Libya). His capital was the coastal city of Alexandria in the north of the Nile delta, founded by Alexander during his visit to Egypt in 331 BC. Alexandria – superbly situated for east–west trade – quickly became the jewel of the Mediterranean, taking over from Athens in cultural terms, and grew into a great city as a result of encouraged immigration from the rest of the Greek world.

Third-century Ptolemaic Egypt is characterized by good kings, relatively stable government, and enormous prosperity. Although there were brief interventions in mainland Greece, Egypt's major foreign problem was an ongoing dispute with the Seleucids (see below) over the area called Coele (in Greek "Hollow") Syria, the region comprising much of the modern Middle East. A series of Syrian wars were fought during the 3rd and 2nd centuries BC, with varying outcomes. By the middle of the 3rd century Ptolemy II had developed the largest and most powerful naval fleet ever known in the ancient Greek world (although the navy did experience a few defeats in battle), and Egypt became the protector of the Mediterranean, securing the safety of trade and travel against the threat of pirates. At the end of the 3rd century the kingdom was shaken by a native revolt in which Nubia (southern Egypt) seceded for a time.

In the 2nd century the growing interest of Rome in eastern Greek politics was combined with weak Ptolemaic kings and continued Syrian wars. The Ptolemaic habit of brother–sister marriage led to even worse cases of incest, resulting in several multiply interrelated claimants to the throne at various periods. Rivals were murdered, princesses were married off to foreign kings to seal temporary alliances, and the support of Syria and Rome was sought by different factions. The last Ptolemaic queen was Cleopatra VII, descended from an illegitimate royal line. Julius Caesar came to Egypt in the mid-1st century BC in the course of his war with Pompey the Great, and fought on Cleopatra's behalf a war against her brother-husband (the so-called "Alexandrian War"). Their love affair resulted in the birth of a son. Cleopatra turned to Mark Antony after Caesar's assassination, and their even more famous love affair ended with a naval defeat at the Battle of Actium in 31 BC at the hands of Octavian (later the emperor Augustus). Both committed suicide, the Ptolemaic dynasty ended, and Greek Egypt became a province of Rome.

The Seleucid empire was established by Seleucus, a Macedonian general of Alexander the Great who had received the satrapy of Babylon during the various divisions of Alexander's empire. He was eventually confirmed as ruler also of the territories east of the Euphrates – the huge Asian empire of Alexander which included modern Iran, Iraq, Afghanistan, and Pakistan as far as India. Seleucid control over much of this vast territory was nominal, with several royal expeditions during the next three centuries in not always successful attempts to reconquer or pacify various regions. After the battle of Ipsus in 301 Seleucus received the area of greater Syria (the northern part of the Middle East, not to be confused with the boundaries of the modern state of Syria), and this became the heartland of his empire, now with an outlet to the Mediterranean. A new capital city was founded at Antioch on

the Orontes river (the city of Antakya in modern Turkey), with a seaport on the coast at Seleuceia in Pieria. Antioch became one of the greatest and most important Greek cities of later antiquity. Seleucus also encouraged Greeks from all over the Mediterranean to inhabit his kingdom, and the early Seleucid kings were enthusiastic city founders, founding several cities throughout their empire in which Greek urban lifestyle, institutions, culture, and language were established and continued for centuries.

During the 3rd and 2nd centuries the Seleucids fought several wars against the Ptolemies for the control of adjoining Coele Syria (see above), and suffered dynastic disputes and revolts by brothers, cousins, and eastern satraps. Expansion into Asia Minor came up against the growing power of the Attalid kingdom of Pergamum, and in the 2nd century Rome's unfavourable attention focused on king Antiochus III the Great because of his troublemaking alliances with other Hellenistic kings and forays into mainland Greece. In 191 BC Roman forces defeated Antiochus at the Thermopylae pass in central Greece (the site of the famous battle of the Persian War in the 5th century BC). He refused harsh Roman demands and an ultimatum that he withdraw to Syria. Risking all in battle, he was decisively defeated by a Roman army at the Battle of Magnesia in 189 BC. The resulting Peace of Apamea in 188 meant that the Seleucid empire was no longer a Mediterranean power, and successful revolts in the eastern territories decreased the extent of its influence.

Later Seleucid history is dominated by catastrophic dynastic disputes and the rise of pretenders to the throne which led to constant civil wars (much of the conflict was aided and abetted by Ptolemaic kings who intervened in devious ways in order to weaken their main rivals). The situation deteriorated to the extent that the Syrian people offered the throne to the king of Armenia in 83 BC. After appealing to Rome, the last Seleucid king, Antiochus XIII, was temporarily restored to the throne in Antioch under Roman protection in 69 BC, but in 64 BC Syria was made a Roman province.

The rise of the kingdom of Pergamum also lies in the age of Alexander's successors. Philetaerus, of mixed Macedonian and Paphlagonian background, is first seen in the entourage of Antigonus the One-Eyed, then in that of Lysimachus of Thrace, and finally in that of Seleucus I. He had been put in charge of the stronghold of Pergamum, a city in northwest Asia Minor (now Bergama in modern Turkey), as well as a substantial treasury. The descendants of Philetaerus gradually established their independence from the Seleucids, and deprived the Seleucid empire of large areas of Asia Minor by cunningly intervening in Seleucid civil wars. Attalus (after whom the Attalid kingdom of Pergamum is named) was the first ruler to take the title of king in the late 230s BC, as a result of his military victories over Celtic mercenaries (called Galatians) in Seleucid employ. By means of lavish sculpted dedications, Attalus depicted his victories as important achievements, and himself as the champion of Greek freedom against a renewed barbarian threat. The Attalids early on were allies of Rome against Philip V of Macedon, and established the beginnings of an overseas empire in the Greek islands of Aegina, Andros, and Euboea.

Attalus I's sons continued as Rome's allies against various Greek foes, and Pergamum was rewarded with vast grants of territory in the reassignment of territory in the Peace of Apamea in 188 BC. After the Galatians were finally decisively defeated, Pergamum became the most powerful kingdom in Asia Minor, and extensive building operations on the acropolis transformed Pergamum into a magnificent Greek city. A library of Greek literature rivalled those of Athens and Alexandria (some scholars say that parchment, called in Greek *pergamena* after the city, was invented there to remove dependence on Egyptian papyrus), and monuments proclaiming in mythological terms the Attalids as the defenders of Hellenism and civilization against barbarism were erected. These are among the greatest creations of Hellenistic art. In order to reinforce their place in the Hellenic world, the Attalids also dedicated lavish buildings at Delos, Delphi, and Athens (the stoa of Attalus II in the Athenian Agora is a famous example of their beneficence towards Greek cities).

The Attalid dynasty came to an end in 133 BC upon the death of its last king, Attalus III, who for uncertain reasons bequeathed his kingdom to Rome, thereby giving Rome a free rein to intervene in Greek Asia Minor.

During the Hellenistic period the Greek cities of Asia Minor and the islands suffered different fates under the shifting control of various Hellenistic monarchs. The Dodecanesian island of Rhodes maintained its democratic independence for some time despite attempts by the kings to control it, and it gained a position of considerable power and prestige in the Greek world at this period. Its position on the east–west trade routes and the facilities provided by five harbours in the capital guaranteed considerable economic prosperity. Bravely resisting a year-long siege by Demetrius Poliorcetes against immense odds in 305/04 BC, Rhodes built up its navy and gradually replaced the Ptolemies as protector of Greek cities in the Aegean against marauding pirates. Friendship with Rome ensured rewards for Rhodes in the Peace of Apamea in 188 BC, and it was granted extensive territory on the mainland of Asia Minor. The democratic system of government on Rhodes allowed for the development of anti-Roman factions, however, and Rhodes was punished for its support of Macedonia in the Third Macedonian War. It was forced into an unequal alliance with Rome in 164 BC, and thereafter ceased to be an independent political power, although it remained a prosperous and highly cultured city.

The Hellenistic age saw the expansion of Greeks and the Greek way of life into Asia Minor, the Middle East, Egypt, Iraq, Iran, Afghanistan, and Pakistan as far as India. Some settlements were not as successful and long-lasting as others, depending upon the fortunes of the Hellenistic empires, but Greeks and the Greek language lasted in these areas throughout the Roman empire until it phased into the world of Byzantine Greece. It could be maintained that the Hellenistic period had a more cosmopolitan Greek culture than that of the parochial city-states in the Classical period. Unfortunately, the Greek world was ultimately unable to resist the power of Rome in political terms, but, far from extinguishing Greek culture, Rome itself became captivated by Greek scholarship, philosophy, and literature.

Political History 31 BC–AD 330

Many discussions of the history of Roman Greece begin with the famous line from Horace: "Graecia capta ferum victorem cepit" ("Greece, the captive, took her savage victor captive", *Epistulae*, 2. 1. 156). It is true that Greek ideals and language captured and dominated the eastern Mediterranean world, but politically Greece became part of the Roman sphere of influence long before the triumphs of Augustus and the poems of Horace. As early as 229 BC the Romans had established protectorates over Greek towns, such as Corcyra, Apollonia, Dyrrachium, and Issa, and in the mid-2nd century BC the Romans arrived to stay in the eastern Mediterranean region. In 146 BC the Romans, led by L. Mummius, destroyed the Achaeans near Corinth. Corinth was razed, its treasures were shipped to Rome, men were massacred, and other inhabitants were sold into slavery. The Achaean League was dissolved, and Greece ultimately became the site of much bitter Roman warfare throughout the 1st century BC. The Civil Wars brought Pompey and Caesar and then Octavian and Mark Antony to Greece, where the combatants depended upon men and material aid from the Greeks, putting significant psychological and economic burdens on the population.

Once the east was conquered, the Romans needed to manage their new territories. The organization of political control in Greece was complicated by Roman respect for Greek culture and traditions, so that the province's administrative status underwent several changes throughout the centuries of Roman rule. Shortly after the Battle of Actium (31 BC) Octavian created the new province of Achaea (roughly the area of modern Greece without Crete, Macedonia, and Thessaly). The idea of a unified Greece rather than politically independent city states took root in this era, even though parts of what we now consider Greece remained separate. Epirus was eventually (though temporarily) made into a separate province as well. The province of Achaea was at first under the control of the Senate (i.e. "proconsular"), but both Achaea and Macedonia were, according to Tacitus (*Annales*, 1. 76), officially turned over to the emperor in AD 15. After AD 44 "proconsul" and "praeses" are both used to describe the governor of Achaea, and the province seems to have, de facto, reverted to proconsular rule. The Greeks briefly enjoyed some independence under a grant from Nero. At the Isthmian Games in AD 66/67 he declared Achaea free, though this status was overturned by Vespasian only a few years later. Achaea was formally made proconsular again in either Diocletian's or, more likely, Constantine's reign, after which the governors of

34. The Hellenic world in the Roman empire

Achaea are known only as proconsuls or consuls until they disappear from the record in the 5th century AD.

After the conquest the Hellenistic leagues endured (at least 12 are known), but they were of little bureaucratic importance. Instead, the Greek provinces were ruled through their well-established cities where small groups of local elites played important roles as Roman managers and representatives, and ran the day-to-day provincial business. Among the most important duties of the cities and their managers was the collection of imperial revenues. It was likely that as early as the reign of Augustus (as Octavian was styled from 27 BC onwards) regular taxation was levied. Both a "head tax" (*tributum capitis*) and a "land tax" (*tributum soli*) are attested under the Principate. Other levies included customs and port taxes, sales taxes, and special levies in times of need. Though statistically relatively low (probably less than 10 per cent), taxation was despised by the provincials and felt to be oppressive, and may well have been devastating to subsistence farmers and other poorer provincials. Not all cities, however, were subject to regular taxation and control by the provincial governor. Pliny (*Epistles*, 8. 24. 2–3) states that the cities most revered for their Classical history were granted freedom and immunity from levies (these included Amphissa, Athens, Corinth, Delphi, Elateia, Pallanteion, and Sparta). But even these cities were sometimes asked to provide contributions from a sense of "friendliness" to the Romans. Strabo (*Geography*, 8. 5. 5) notes that the Spartans "were held in particular honour, and remained free, contributing to Rome nothing else but friendly services [*philikon leitourgion*]". Of particular importance to the economic health of Greece, however, is the crucial fact that, whether regular or sporadic, resources were drained away from Greece into the coffers of the larger empire.

In addition to any economic burdens, the Greeks experienced a mixed blessing from their location at the centre of the empire. Technically, Achaea was an unarmed province with little military presence, so the influence of the empire may often have been a degree less obvious and oppressive in Greece than on the frontiers. Only small contingents of soldiers, rather than significant garrisons, were found in the territory during the early empire. On the other hand, the economic stimulation that the frontier provinces experienced was missing in Greece, where insulation brought a measure of economic stagnation.

For the most part Greek citizens and cities were unmolested and enjoyed the fruits of the *pax Romana*, but there were examples of violent strategies in the imposition of early imperial control. The arrival of the Romans sometimes meant territorial and demographic manipulation. Particularly in the early years of Roman control under Caesar and Augustus, land was taken and redistributed to show pleasure or displeasure with one city over another. These were considered the rights of the victor over the vanquished. Cities and colonies were founded at will. Corinth, for example, was rebuilt, colonized, and grew under the support of Caesar and then Augustus. Augustus also

founded Nicopolis in Epirus, and Dium and Cassandreia in Macedonia, while Caesar was known to have created the city of Patras in Achaea and possibly Dyme nearby. Augustus not only manipulated territories, he moved people. Men were transferred, for instance, into Patras where the emperor "united them with the Achaeans also from Rhyope, which town he razed to the ground" (Pausanias, 7. 18. 7).

Recent archaeological and historical work supports ancient claims, such as those of Pausanias, that there was significant movement of populations and realignment of states under the emperors. Results from archaeological survey in Aetolia show a clear pattern of site abandonment in the Roman era which reflects the claims of Pausanias (7. 18. 8–9) that the province was "laid waste" by the emperor Augustus. Epirus, too, was depopulated – so much so that Strabo claims all remaining Epirots in Augustus' time would fit into a single city (7. 7. 6).

Over the course of the 1st and 2nd centuries AD in Greece, as elsewhere, there was a trend towards larger, but fewer, administrative centres such as Corinth, where the provincial governor and his staff were based. Corinth itself did not formally control other Achaean cities, or even mediate between them and the Romans, but it did show a particularly close connection to Rome. Corinthian coinage was modelled on Roman, its pottery showed clear western influences, and Corinth was the site of one the earliest overseas capitolia (though its precise location is still disputed). Clear benefits of empire also accrued to regions outside Corinth. As is well known, one way to emphasize one's political power and prestige was through patronage. The emperor Augustus began a long-imitated trend when he made Greece the beneficiary of such largesse. He continued to rebuild Corinth, which probably became the provincial capital at that time (and which remained Latin-speaking until the reign of Hadrian). Roman Messenia also shows signs of growing prosperity with the coming of empire. Pausanias (4. 31. 5–33. 2) lists numerous Roman-period structures, both civic and religious, which testify to an affluent way of life.

Many Roman emperors evinced a personal interest in Greek culture and history (sometimes, of course, this meant despoiling Greece of its art and antiquities). Nero, for example, was a devoted philhellene. He spoke Greek, attempted to cut a channel through the isthmus of Corinth (to improve communications and trade routes), became an Athenian archon, and was initiated into the mysteries of Demeter. Imperial dedications to Greece could be substantial, including buildings, roads, and other physical manifestations of their concern for Achaea and their own prestige. Trajan had built the Library of Pantaenus in Athens. Hadrian supported numerous projects including buildings at Delphi, many structures in Athens – creating a "New Athens" in the process – as well as stoas, temples, aqueducts, bridges, and baths throughout Achaea. In AD 131/32 Hadrian founded the "Panhellenion", a largely cultural organization of Greek cities (from Greece, Asia Minor, and north Africa) centred in Athens. The respect for Greek culture supported by the creation of this organization lasted well into the 3rd century AD. Throughout these years the Greeks kept their language, culture, and traditions, and continued to maintain control over their cities, which may help explain why, for the most part, the Greeks were loyal to Rome.

The late 2nd and 3rd centuries AD brought unwelcome changes to the Roman world as a whole. Civil wars, economic woes, migrations, and invasions from the north characterize this era in Roman history. Revolts erupted periodically in the 2nd century AD, including at least one in Greece: A small abortive rebellion occurred under the relatively benevolent rule of Antoninus Pius. The chaotic 3rd century AD brought civil wars and extensive Gothic raids to the Balkans. Greek territories were not immune. The restless northern peoples were no longer stopped at the borders of the empire after the death of Severus Alexander (AD 235). Thrace suffered the first assaults from Gothic invaders and related tribes. The emperor Decius was eventually killed by these invaders, which led to further raids and a civil war. The Danube and Rhine regions were the locations of most of this raiding activity, but in AD 254 raiders made their way as far south as Thessolonica. Many parts of Greece, especially coastal areas such as Athens, were severely damaged by these incursions. In the AD 260s further raids occurred. Gallienus repelled the intruders in AD 262, but he was soon forced to return to protect Greece again. Gallienus, just like Hadrian, was a philhellene, held the archonship in Athens, and was initiated into the Eleusinian mysteries. His support for Greece was sorely needed when in AD 268 the Heruli captured and wrought considerable destruction upon Athens. Eventually Gallienus expelled the Heruli, but such attacks were only slowed and would happen again in the future (most notably in the 5th, 6th, and 7th centuries).

In the 3rd century AD the empire was also faced with fiscal crises. Inflation worked to wreak havoc on urban financial structures. The content of silver coinage (the denarius) had become debased, while at the same time imperial mints were producing ever-growing quantities of money in an attempt to keep up with fiscal demands. The situation grew particularly painful for Greek cities and their elite, the *curiales* or *bouleutai* ("councillors"), who had drawn their revenues from civic lands, from taxes, and from local dues and tolls. Those leaders with access to goods, rather than money, were able to increase prices and rents, but they became hard pressed if they depended upon debased and devalued revenues. The *curiales*, thus, began to feel unable to carry out their administrative duties. The needs of the imperial treasury, as expressed by the Roman *correctores* (regional governors, normally senators) who now governed Achaea, led to the loss of autonomy for any remaining free Greek cities. Increasing demands on the province as a whole required new strategies for production, which strategies would eventually result in a late Roman (4th- and 5th-century) resurgence of economic prosperity in Greece.

Upon Diocletian's accession to the throne in AD 284, the empire was temporarily at peace and the emperor set about solving the more serious economic and social problems in the provinces. To fix the problem of ruling vast territories, Diocletian reorganized provincial administrative units. There were 45 official districts in AD 117, but 108 districts by the end of the 4th century. Diocletian had expanded the number of Severan provinces by creating smaller provinces for easier administration and methodically divided the empire into clear eastern and western sections. The province of Achaea (with its capital still at Corinth) was incorporated into the administrative structure of the east. Diocletian placed Achaea into the diocese of Moesia, though Constantine moved the province

under the jurisdiction of Macedonia in Illyricum. Northern Greece included the provinces of Epirus, Thessaly, and Macedonia. Crete remained a separate province. These provincial divisions continued to separate what we think of as "Greece" into several administrative units, but provided smaller territories that allowed for more efficient management and tighter control.

Once Diocletian stepped down from his office, conflict began again and the Balkans, Greece included, became a recruiting ground for Constantine's civil war with Licinius. Constantine, once in power, set about moving his capital to "New Rome" or Constantinople. In the tradition of earlier emperors, he felt it his right to remove art and artefacts from his provinces, including Achaea, to beautify his new capital. Nevertheless, 4th-century Achaea generally saw a renewal of building activity, an invigorated economy, and another revival of Greek letters after the hiatus of the civil wars. Subsequently, Achaean political, religious, and economic orientation was focused on the east and thus began the transition to the later Roman empire, or early Byzantine era in Greek history.

Political History AD 330–802

The period AD 330–802 is dominated in its early phase by the dynasties of Constantine the Great and Theodosius the Great. The middle period contains the spectacular rule of Justinian followed by his less fortunate successors. The years from 610 to 802 witness the rise of two relatively long-ruling houses founded by Herakleios and Leo III the Isaurian, respectively. Each of these epochs is characterized by internal and external troubles, some being an outgrowth of unresolved earlier problems, while others were unique to their times. The history of these roughly 500 years reflects the efforts of the imperial government to find practical solutions to these difficulties, and at the same time to maintain the fiction of an empire undiminished in authority and power.

When Constantine the Great (324–37) inaugurated his new city of Constantinople on the Bosporus in AD 330, he set in motion a movement that would end with the two halves of the empire forming a Latin-speaking west and a Greek-speaking east, each with its own government and cultural life. If Constantine, who was the first ruler to protect the Christians among his subjects, had hoped to unite the empire under the banner of the new religion, he was to be disappointed. His reign and the reigns of his immediate successors were beset with Christological controversies and bickering within the ranks of the Church.

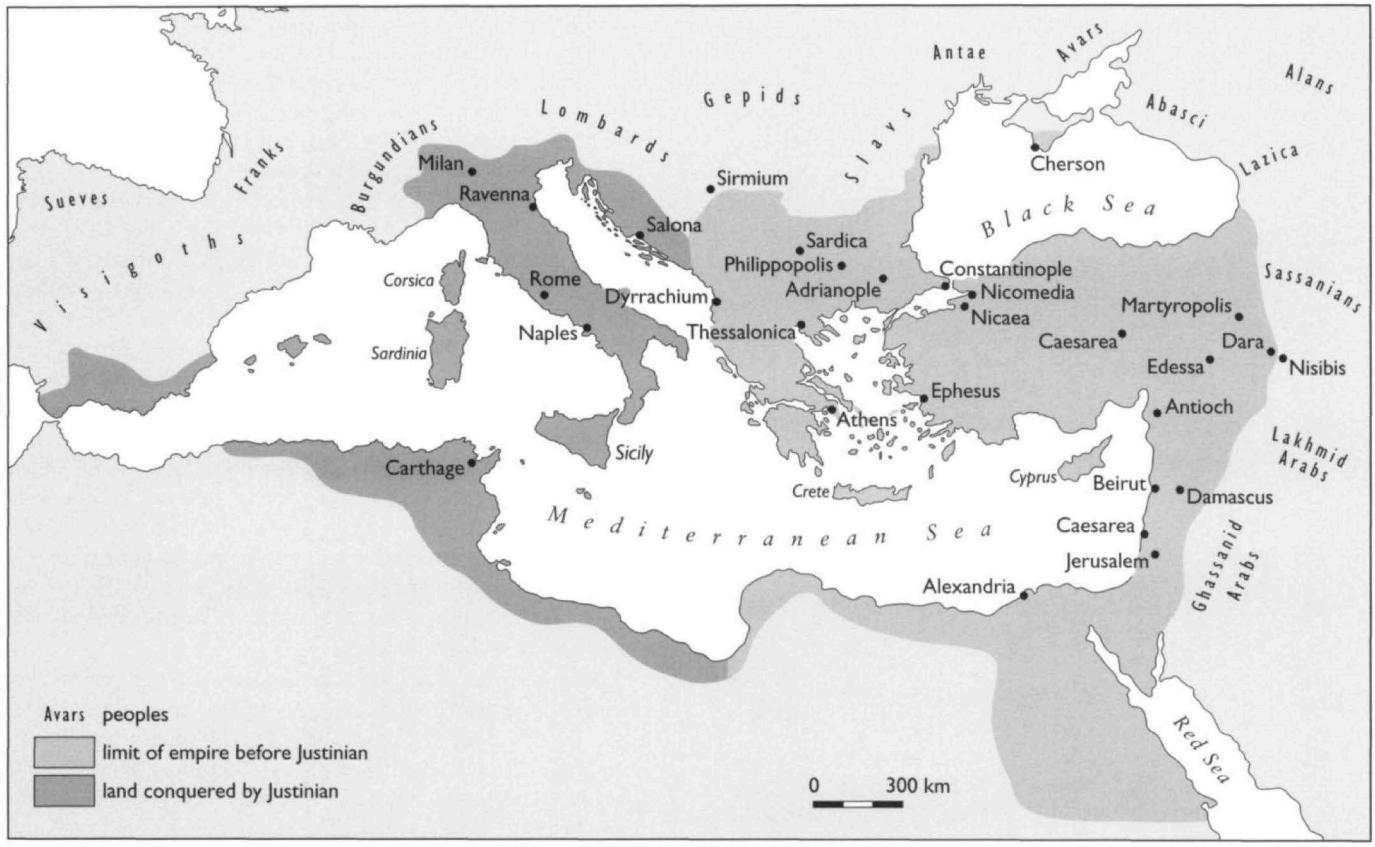
It was left to Theodosius I (379–95) to found the orthodox state, enforce uniformity, and in consequence deny toleration to pagans and heretics. Questions of dogma and definitions of the right faith were hammered out in ecumenical councils, of which the first dealt with the Arian heresy at Nicaea in 325 under Constantine, and the second with the establishment of Christianity as the state religion under Theodosius at Constantinople in 381.

The enemies threatening the security of the empire during this time were the Persians on the eastern borders, and the invading Germanic barbarians who had earlier threatened the Rhine frontier and later overrun the hinterland of Constantinople. The terrible defeat of a Roman army by a Gothic force at Adrianople (378) and the death of the emperor Valens in this battle brought Theodosius to the throne. He settled the Gothic threat by making the Visigoths *foederati* (confederates) of the empire, and he was able to secure a peace with Persia which ended for a time the ceaseless warfare in that region. This peace, however, depended on sacrificing the independence of Armenia which had been the apple of discord between Persia and the empire and was now divided between the two powers. It was timely, since the empire faced new dangers on its borders with the advance of the Huns.

In Church affairs there was bitter discord between Alexandria and Constantinople, both struggling for ecclesiastical supremacy. The matter was finally resolved in 451 at the Fourth Ecumenical Council at Chalcedon which decided in favour of Constantinople. The same council, in addition, was sowing the seeds of further conflict with its definition of the Orthodox faith. From now on the Eastern Church would find it impossible to please Rome as well as Syria and Egypt.

The reign of Justinian (527–65) is distinguished by the emperor's efforts to restore the Roman empire to its former size and to re-establish Roman authority in the territories lost during the barbarian invasions. The emperor's general, Belisarius, in quick succession wrested North Africa from the Vandals and began the conquest of Italy. Finally, a strip of territory in southern Spain was taken from the Visigoths.

In the internal affairs of the empire, Justinian quelled the rowdy circus factions in Constantinople when he put down the Nika uprising. The destruction that had been done in the capital during the rebellion allowed the emperor to embark on an ambitious building programme, the most impressive result of which was the church of Hagia Sophia. All of this activity needed money, and for this reason Justinian tolerated the excesses of his minister of finance, John of Cappadocia.



35. The empire of Justinian in AD 565

New dangers for the empire arose in the Danubian provinces with the first appearance of the Slavs and Bulgars. At the same time, an outbreak of plague in 542 created a serious shortage of recruits for the army. In the reigns of Justin II (565–78) and his successors the resources of the empire were unequal to the demands made on them. Justin himself became insane, unable to carry the burden of his responsibilities. He had provoked an outbreak of hostilities by his arrogant treatment of the Persians. At the same time, the Avars, a people of Turkic origins, together with hordes of Slavs, attacked the Balkans, and Italy was overrun by the Lombards.

The emperor Maurice (582–602) was able to obtain a favourable peace with Persia in 590 when he helped Khusrau, the heir to the throne, to regain his kingdom after a rebellion that had killed his father. Before Maurice could turn his attention to the dangerous situation in the Balkans, however, he himself was overthrown and killed in 602 in an army rebellion that elevated Phokas, an insignificant officer, to the throne. Phokas initiated a reign of terror that bled the aristocracy until in 610 he too became the victim of a revolt. The exarch of Carthage rebelled and sent his son, Herakleios, at the head of an army against Constantinople, where he founded a dynasty that was to last till 717.

Herakleios (610–41) came to the throne of an empire that was in mortal danger. The Avars and Slavs continued to be a threat, and the Persian king broke the peace on the pretext of avenging the murder of the emperor Maurice. Herakleios, leaving his capital in the care of the patriarch, went to Asia Minor to gather and train an army for the defence of his realm. For six long years the emperor campaigned against the Persians with great success, breaking the power of the Persian king. The benefit of his victory, however, was to be reaped by another. The reign of Herakleios saw the tribesmen of Arabia, possibly driven out by the increasing desiccation of their lands, and steeled by the new faith of Islam, overrun both Persian and Byzantine territories. Sassanian Persia succumbed to the new power in 628, to be followed in quick succession by Syria, Palestine, and Egypt. At the death of Herakleios in 641 the Byzantine empire was territorially more compact, comprising Asia Minor, some Balkan coastlines, north Africa, and Sicily.

With the loss of the eastern provinces came greater religious homogeneity. In the future, the Orthodox Church and the Orthodox empire were to be closely intertwined. The heart of the empire now lay in Asia Minor, and with Italy mainly in the hands of the Lombards, the eastern empire became distinctly Greek in language and culture. This was not necessarily clear at the time, and Constans II, Herakleios's grandson, attempted to move the seat of government once more to the west. The experiment ended when he was murdered in Sicily in 668. The last member of the house of Herakleios, Justinian II, reigned twice from 685 to 695 and again from 705 to 711. His arbitrary government became unpopular, and he was banished to Cherson after having been mutilated. In spite of this he was able to regain his throne with the help of the Bulgar khan Terbel, but was killed in an uprising in 711.

The importance of the Herakleian dynasty lies in the fact that it stayed the Arab invasions and preserved Asia Minor. When the Arabs built a fleet and became expert sailors, Constantinople was in grave danger from repeated attacks. Its strong walls, however, withstood the sieges, and in 678 the

caliph Muawiya made peace. Three short reigns followed after the Herakleian dynasty, but in 717 the general of the Anatolikon theme, Leo III the Isaurian (or Syrian), ascended the throne, inaugurating the Isaurian dynasty that was to last until 802.

In 717 the Arabs returned to mount an assault by land and sea on the capital. The siege was abandoned the following year when a discomfited enemy withdrew after an exceptionally hard winter, and Leo's victory at Akroinon in 740 temporarily ended the Muslim advances in Asia Minor. Applying diplomacy, the Byzantines had been able to draw both Bulgars and Chazars to their side in the fight against the Arabs.

Internally, Leo, who had himself been brought to the throne by an army revolt of the Anatolikon and Armeniakon themes, understood the danger these large units posed for the ruler. He, therefore, restructured these territories creating smaller units that were less likely to provide any would-be usurper with the necessary resources. He is thought to have applied the same principle to the Karabisianon theme which housed the fleet.

In 726 Leo issued the *Ecloge* (literally "selection"), reforming the law of the empire. Far more than a mere compilation, this body of legislation reflects the influences of both custom and the orient. In family law, the *Ecloge* curbed the power of the *paterfamilias* by distributing rights and obligations more evenly between spouses; and in criminal law mutilation largely replaced the death penalty.

Leo's reign is remembered as the beginning of the conflict over the use of icons. Icons had a special place in popular worship but were opposed in some theological and intellectual circles. The motives for the emperor's sudden move against the veneration of icons are no longer understood, and possibly were not clear to his contemporaries either. It has been suggested by some that Leo, who came from the eastern provinces of the empire, had fallen under the influence of Arab culture. It is of some significance that the first order forbidding the veneration of pictures was issued in 723 not by a Byzantine ruler but by the caliph Jezid who ordered the removal of pictures from Christian churches in his domain. Others detect in the emperor's fight against icons purely political motives, proposing that Leo, in his bid for autocratic rule, hoped to liberate the people from the influence of the Church. The sources of this period are biased since only the accounts of the iconodules (supporters of icons) survive, making it difficult to grasp the intellectual background to iconoclasm in its totality. Leo tried to gain converts to his ideas by preaching against the veneration of icons which he saw as idolatry. He wrote to Pope Gregory II that this was his duty not only as emperor but also as high priest to his subjects.

Persecution of icon worship began with the removal of Christ's image from above the gates of the Chalke, the entrance to the Great Palace in Constantinople. The officer sent on this commission was lynched by a crowd. Significantly, it was the European theme, Hellas, that immediately revolted at the news. Leo was able to quell the rebellion but could convince neither the pope nor the patriarch of his move against icons. Leo's most formidable opponent, however, was John of Damascus, regarded as the greatest theologian of his time. As a Greek in the service of the caliph at Damascus, he was out of reach of the emperor. John wrote three speeches in defence of holy icons arguing in Neoplatonic terms that icons were merely symbols and a means to communicate with the sacred. His writings were to become the basis for the defence of icons.

With his edict of 726 Leo gave imperial sanction to the destruction of pictures, and the persecutions of the iconodules began in earnest. The emperor could not enforce his will in the west, however, and Pope Gregory III condemned iconoclasm. In a counter move, Leo placed the Churches of Calabria, Sicily, and Illyricum under the patriarchate of Constantinople which meant that the incomes from these territories would now flow directly to the eastern capital.

Leo died in 741 and was succeeded by his son Constantine V (741–75) who had been associated in his father's reign since the age of two. The *strategos* (commander) of the Opsikion theme, Artabasdos, who was related to the imperial house, immediately contested Constantine's succession. He posed as a restorer of images but was defeated in 743. Constantine then took advantage of unrest in the Caliphate, where the Abbasids had replaced the Umayyads and moved the centre from Damascus to Baghdad, to recapture territory in Asia Minor that had been lost in earlier campaigns. For some time, the fight between Arabs and Byzantines was to take on the character of border conflicts, a fact which was later immortalized in the epic of *Digenis Akritis*.

The danger facing the empire was now no longer to be seen in Asia Minor but in the rising power of Bulgaria. Constantine V fought nine campaigns against the Bulgars. In 763 he won a

great victory over the khan Teletz who in consequence became the victim of a revolt at home. After this the Byzantines interfered frequently in Bulgaria, which entered a phase of internal upheavals. While Constantine was thus engaged in the Balkans, Ravenna, Byzantium's outpost on the Adriatic, fell to the Lombards. With the eastern empire no longer an important power in Italy, in 754 Pope Stephen II crossed the Alps to seek an alliance with the Frankish monarchy which marked the beginning of a lasting relationship between the papacy and the Carolingians.

In his iconoclast policies Constantine was more radical than his father had been. The "headless synod" of 754 ordered the destruction of pictures, and was followed by renewed persecutions and executions reaching into the highest strata of society. Monasteries were closed down, and their lands were confiscated. Those monks that could escape fled to southern Italy where they founded monasteries and schools, thereby reinforcing the surviving Greek culture of the region.

Hated by the Orthodox Church for his heavy-handedness, the body of Constantine V Kopronymos was later removed from the church of the Holy Apostles where it had been buried. He was, however, also remembered for his great military successes by the people who, in times of danger, would pray at his grave for deliverance from their enemies.

The reign of his son Leo IV (775–80) was characterized by a much more restrained form of iconoclasm. Iconodules were left largely undisturbed, and monks returned to high positions in the Church. When Leo died prematurely in 780, his ten-year-old son became emperor Constantine VI with the iconodule empress Irene as regent. She systematically began to change the officials at court, advancing her own family. The monasteries flourished again under Irene, and she tried to achieve reconciliation with both the papacy and the Frankish power now under Charlemagne. An ecumenical council in 787 anathematized the iconoclast synod of 754 and re-established the veneration of icons. Irene herself signed the canons to that effect in the Magnamara palace in the presence of papal legates. Her name was invoked as a token of peace, and her government was hailed as the bringer of it.

The young Constantine was kept in the background, and his mother arranged several marriages for him. These were the cause of irreconcilable differences between them and in 797 Irene had him imprisoned in the palace and blinded in the very room where he had been born.

The subsequent reign of Irene (797–802) was marked by renewed hostilities and losses in warfare with both Arabs and Bulgars. The latter received tribute payments from that time on. Internally, Irene did much damage to the finances of the empire with a taxation policy that aimed to win her popularity. The most important event of her reign, however, came from the outside. Pope Leo III took the opportunity presented by her rule to crown Charlemagne emperor of a reconstituted western empire on Christmas Day 800 since, so the pope reasoned, there was now no longer an emperor in Constantinople. This signalled the end of the long-maintained fiction of a universal Christian empire with its centre at Constantinople.

In autumn of 802 a palace revolution ended the rule of Irene and she died a year later in exile on the island of Lesbos. It fell to her successor, Nikephoros I (802–11), to undo the damages of her reign and he addressed himself energetically to restoring the financial and military needs of the empire.

Political History 802–1204

In 802 Byzantium was still recovering from the crises of the previous two centuries. Its realm, of Asia Minor, parts of Greece, Sicily, and toeholds in Italy, was threatened on every side. The vast and far richer Abbasid caliphate, then at its height, was the most obvious threat as Arab forces continued to harry Asia Minor, but the Bulgarian kingdom posed an equally serious threat close to the capital, and the rising empire of Charlemagne loomed in the west. Nikephoros I (802–11), who made important reforms that strengthened the administration after the extravagant reign of his predecessor Irene, recovered the Peloponnese, strengthened the Hellenic population of Greece, and hoped for greater success in the Balkans. Instead, his huge army met with disaster at the hands of the

36. The empire of Basil II in 1025

Bulgars, with Nikephoros becoming the first emperor to fall in battle since Valens in 378.

Although the Bulgars inflicted more defeats and advanced up to the walls of Constantinople, the death of their khan removed the immediate threat. These military setbacks provoked Leo V (813–20) to revive iconoclasm, remembering the great military successes of iconoclastic emperors in the 8th century. His murder, however, was followed by the devastating revolt of Thomas the Slav during which the Arabs landed in Sicily and – a more immediate threat to imperial naval supremacy close to home – occupied Crete in 828. Theophilos (829–42) laid the basis for recovery by tightening the administrative system based on military districts called themes, and improving the army. He issued new coinage, was an active builder, and presided over a cultural revival. Nevertheless, he suffered the humiliation of seeing Amorium, home of the dynasty, fall to Arab attack in 838.

The tide turned under Michael III (842–68). His victory in Asia Minor in 863 brought the centuries of Arab raids to an end, while his extensive fortifications laid the basis for advances to the east. He had restored veneration of images in 843, ending a long period of ecclesiastical turmoil. Byzantine influence now spread to the Slavic world thanks to the missionary efforts patronized by the highly learned patriarch Photios (858–67, 877–86). Although at first directed to Moravia, they soon led to the conversion of the Bulgars and Serbs to Orthodox Christianity. In 860, however, a potential new threat, a Russian fleet, appeared at Constantinople.

Basil I (867–86), an Armenian of humble origins, founded Byzantium's most successful dynasty, which presided over triumphant expansion, prosperity, and cultural flourishing for two centuries. Basil himself rebuilt the army and moved on the offensive in the east. He conquered much of southern Italy, which became a refuge for the Greek population of Sicily, finally lost with the fall of Syracuse in 878. Basil's work of reforming the laws and making them available in Greek was continued by his son Leo VI (886–912), a ruler famed for his learning, but also for his four marriages which caused serious dissent with the Church. External troubles also were not over: an Arab raider sacked Thessalonica, second city of the empire, in 904 and the Russians attacked in 907, but the greatest danger came from the Bulgars. To weaken them, Leo called in the Hungarians whose settlement permanently changed the map of Europe. Nevertheless, this was a flourishing time for the Bulgars whose king Symeon aimed at ruling the empire. During the regency that succeeded Leo, Symeon's victorious forces approached Constantinople and almost assured his aims of an imperial title and marriage, but the usurpation of Romanos I Lekapenos (920–44) saved the day for Byzantium. In the east Romanos extended Byzantine territory to Armenia and Mesopotamia, where in 944 Edessa fell and one of Christianity's most sacred relics, the sacred towel that bore the imprint of Christ's face, was transferred to Constantinople. He also gained significant victories over pirates and the Russians. Romanos began a legislative assault on great landowners who had been acquiring land from their smaller neighbours, a tendency that could weaken the system of military landholdings; the effort continued through the next several reigns. Meanwhile the legitimate emperor Constantine VII Porphyrogennetos (913–59) devoted himself to the learning

that reached its height in this period. During the short reign of his son Romanos II (959–63) the great general Nikephoros Phokas finally reconquered Crete in 961, re-establishing Byzantine naval supremacy in the Aegean and making further advances possible.

Byzantium reached its apogee under Basil II (976–1025). During his childhood, the regents Nikephoros Phokas (963–69) and John Tzimiskes (969–76) annexed eastern Bulgaria after inflicting a signal defeat on the Russians, and extended imperial power ever further east, bringing much of Syria under control. Tzimiskes, perhaps the greatest general the empire ever had, conquered Damascus and Beirut and even approached Jerusalem in a movement that had many aspects of a crusade. Byzantine influence took deeper root in the west when Tzimiskes married his niece Theophano to the future Holy Roman emperor Otto III. The sole rule of Basil II began with a devastating series of civil wars, 976–89, which finally established imperial supremacy over the powerful landed magnates of Asia Minor, and ended their efforts to submerge their smaller neighbours. Thereafter expansion was rapid on all fronts: in the east Basil annexed much of Armenia; in the west he secured his position in Italy. Basil is most famous, however, for his unrelenting Balkan campaigns that brought Bulgaria under complete control and extended the empire to the Danube. His savage but effective victories earned him the name of Bulgaroktonos, "Slayer of the Bulgars". He was planning a campaign to reconquer Sicily when he died after the longest reign in Byzantine history. By then, the empire was the most powerful state in Europe and the Near East. Of the powers that threatened Byzantium in 802, the caliphate had collapsed, Bulgaria was reduced to insignificance, and the western empire was concerned with its own problems. The empire also enjoyed its greatest influence as the centre of the Orthodox world, vastly expanded in 988 when the conversion of prince Vladimir of Russia brought his country into the Byzantine sphere.

The glory of Byzantium faded with incredible rapidity. Within 50 years of Basil's death, new enemies had struck mortal blows from which the empire never recovered. Although the Komnenoi (1081–1185) effected a partial restoration, the state never regained the extent, wealth, or power it had under Basil II. Incompetent rulers, strife between military and civil factions, increasing decentralization, and frequent conspiracies and revolts combined with changing external circumstances to weaken the empire. In 1040 it was still strong enough to attempt the reconquest of Sicily and to annex further territory in Armenia, but these were the last gains. In the mid-11th century the Seljuk Turks appeared in the east, and the Normans in Italy. Both soon exerted pressure on a state in serious financial trouble. Extravagance had led in 1050 to the debasement of the gold coinage, which had maintained its purity since the time of Constantine and served as a universal standard. In 1054 the Byzantine Church split definitively with Rome, leaving a legacy of hostility that would never be repaired. Two years later the empress Theodora, last descendant of Basil II, died.

The military revolt that brought Isaac Komnenos (1057–59) to the throne in an effort to suppress corruption failed to solve the problems that the ineffectual regimes of his successors only compounded. Finally, Romanos IV (1068–71) made a major attempt to reform the army and to crush the constantly encroaching Seljuks. He met disaster at Manzikert in 1071. The Seljuk victory left Asia Minor open to the Turks who were soon ravaging every part of it, and could never be dislodged. In the same year the Normans took Bari, the empire's last outpost in Italy. During the next decade Turkish attacks combined with constant revolts to destabilize the empire and bring the almost total loss of Asia Minor. Economic collapse was not far away since the currency was drastically debased.

When Alexios I Komnenos (1081–1118) came to the throne, the empire was in ruins. Turks had occupied most of Asia Minor and the Normans landed in Albania and rapidly advanced into Greece. Recognizing the western threat as the most immediate, Alexios turned to Venice, long a subject, then an ally of Byzantium. In exchange for extensive concessions that gave them virtually free trade in the empire, the Venetians sent their fleet to rescue Alexios. This combined with the death of the Norman leader to allow Alexios to turn to the interior of the Balkans where he suppressed revolts and neutralized the invading Cuman and Pecheneg tribes. By 1094 the Danube was once again the imperial frontier. At the same time Byzantium advanced further towards feudalism as the emperor made considerable grants of land with immunity from taxation, especially to his relatives.

Alexios was ready to turn east when the uncontrollable forces of the First Crusade arrived in 1096. He sent them on to Asia Minor where their victories enabled the empire to regain considerable territory. The crusaders' reluctance to submit to imperial authority or to surrender Antioch, however, led to further conflicts, especially with the Normans. Finally in 1110 Alexios was free to move against the Seljuks, who now ruled a state in central Asia Minor. His successes ensured control over the rich coastal region and laid the base for further advances by his son John (1118–43), who consolidated Byzantine Asia Minor by acquiring additional territory and establishing a network of strategic fortresses that served as bases for advance. He campaigned successfully against the Seljuks, whom he confined to the Anatolian plateau. Much of his effort was directed to Cilicia, which he conquered, and to Antioch, which recognized his authority. In the west he consolidated Byzantine control and neutralized the threat from Hungary. His one failure was a war against Venice, after which he was obliged to renew their trading privileges.

During the reign of Manuel I (1143–80) Byzantium was renowned as a centre of wealth and culture, but also saw the beginning of a fatal decline. This was a time of considerable influence from the rapidly advancing West, reflecting the taste and preoccupations of the emperor who tended to neglect the ultimately much greater danger from the east. The immediate threat, though, came with a renewed war with the Normans and the unwelcome arrival of the Second Crusade in 1147. Manuel hurried the crusaders across into Anatolia where they met total defeat. With the expensive help of Venice, he defeated the Normans but failed in the last attempt to establish a Byzantine foothold in Italy. Manuel fought two successful wars with Hungary, which recognized his suzerainty, thereby gaining Dalmatia and the enmity of Venice, which felt threatened. In the subsequent war (1170–77) Manuel had once again to renew all the Venetian privileges. To balance them, he had made similar concessions to Genoa as his father had to Pisa. As

a result, most of the empire's trade was in the hands of the Italian states.

Manuel extended the practice of granting lands to subordinates who would collect taxes and contribute to the army. In this he strengthened his military (though at the price of an increasingly powerful aristocracy) while his new system of fortifications bolstered Byzantine Anatolia preparatory to a major advance against the Turks. He had already made a triumphal entry into Antioch, and entered into alliance with the crusaders of Jerusalem against Egypt. His ambitions in the east, however, came to disaster at Myriokephalon in Asia Minor in 1176. The imperial army that hoped to solve the Seljuk problem once and for all was completely crushed. In the aftermath major bastions fell permanently to the Turks, whose nomads encroached further on imperial territories. Although Byzantium was still the greatest regional power in 1180, Manuel had spent much of its treasury and prestige and his death was followed by a rapid collapse.

Resentment against the Italians and their privileges culminated in 1182 when traders were massacred and their quarters looted. Manuel's cousin Andronikos I (1183–85) seized power during the crisis, cleaned out corruption, and attacked the over-powerful aristocracy, but the disastrous Norman sack of Thessalonica led to his overthrow and murder by the urban mob. Isaac Angelos (1185–95) proved incapable of maintaining central control in the face of external threats and major revolts. Although the Normans were defeated, and the Third Crusade passed through without disturbance in 1189, a successful revolt that established a new Bulgarian empire in 1186 fatally undermined the Byzantine position in the Balkans. Revolts and widespread disorder increased under Alexios III (1195–1203) who had deposed and blinded his brother Isaac. When plans for a new crusade were announced, Isaac's son Alexios appealed for aid against his uncle, making fabulous promises to the crusaders. The Venetians agreed, despite the denunciations of the pope, to divert the crusade to Constantinople, where they arrived in 1203. The young Alexios IV assumed the throne but was unable to pay off the crusaders. When his efforts on their behalf provoked a revolt that deposed him, the crusaders attacked. On 12 April 1204, for the first time ever, Constantinople was taken by a foreign army. The city was mercilessly looted, a Latin empire established, and Byzantium permanently finished as a great power.

Political History 1204–1261

The sack of Constantinople in April 1204 marked the end of the Byzantine empire, at least temporarily. The French and Venetian Crusaders who had brought this about, whether by luck or by accident, sought to carve out lordships in Greece and the Aegean, and in so doing appropriated for their use the name Romania, which from thence fell from Greek usage as a geographic identification of the Byzantine empire. The partition committee of 24 men – 12 Franks and 12 Venetians – based their division on Byzantine tax registers compiled for Alexios IV in 1203. Possession and effective defence of the newly acquired territories were critical. While Niketas Choniates marvelled at the task that lay ahead for the crusaders, the latter sought to make a quick conquest by taking advantage of Greek demoralization and confusion, as well as the continued presence of the crusader army until March 1205.

By September 1204 the area south of the Rhodope mountains between Constantinople and Thessalonica was reported subdued. Up to March 1205 Greek resistance was light and an army led by Boniface of Montferrat, the ruler of Thessalonica, encountered little opposition in taking Thebes, Athens, and the island of Euboea. In much of central Greece the Latins were welcomed as liberators and, after they made concessions to Greek *archontes* (rulers) guaranteeing their own position in the new order and the continuance of Greek inheritance practices and the Orthodox religion, they were even hailed as the bringers of some hope of stability following the destabilization and disintegration which had characterized the provinces of the Byzantine empire in the last 20 years of the 12th century. This first campaign came to a halt before the fortresses of Acrocorinth, Argos, and Nauplia, where the first serious Greek opposition was led by Leo Skouros. Boniface had carefully avoided any trespass on potential Venetian territories in Epirus and he continued to avoid a possibly hostile encounter in the Morea too, when he allowed William de Champlitte and Geoffrey de Villehardouin to conquer that area. The conquest proceeded from Corinth west and south via Patras and Andravida. Three sieges and one battle are mentioned by the western chroniclers; they emphasize the ease with which the conquest proceeded and compromise was reached with the Greeks. There is much that is obscure here. The southeastern corner of the Peloponnese, the Skorta region, was not

37. The Greek world in 1214

conquered until the late 1240s, while many Greek landowners who saw no chance of reaching an accommodation with the Franks sought refuge in Epirus. By contrast, Latin expeditions to Nicomedia and Cyzicus in Asia Minor and up the Maritza valley to Philippopolis (modern Plovdiv) were contained and repulsed by the Nicene Greeks and the Bulgarians respectively.

When they captured Constantinople, the crusaders had not expunged all Greek resistance, as they clearly believed at the time. In July 1203, as the crusaders arrived on the Bosporus and his father-in-law, Alexios III (1195–1203), was deposed, Theodore I Laskaris (d. 1222) established himself at Nicaea; in the summer of 1205, following Latin defeat at the hands of the Bulgarians at Adrianople, he was proclaimed emperor. This Byzantine government in exile was eventually to recapture Constantinople in July 1261, but for now it contained Latin expansion into Asia Minor by securing its power base in Bithynia. The immediate and most serious threat to the Latin position came from the Vlacho-Bulgarians led by Kalojan. Eager to gain papal recognition for a Bulgarian empire, Kalojan had sought coronation as emperor and recognition of a Latin Church from pope Innocent III as early as 1203. Though his initial approaches to the crusading army had been friendly, they had been rebuffed and followed up by Latin incursions into his territory.

In April 1205 Kalojan inflicted a serious defeat on the crusaders at Adrianople and went on to launch raids into Thrace. On Kalojan's death in 1207 the Latin empire was granted a respite, and the subsequent power struggle among his successors was not resolved until the emergence of John II Asen as tsar of the Bulgars (1218–41). Asen contested control of Thrace with the Greeks of Epirus, whom he defeated at the Battle of Klokonitsa in 1230. Thereafter it was his proud boast that the Latins only survived in Constantinople by his leave. Certainly the Greeks rulers of Nicaea were to profit from his death, gaining many Bulgarian territories in Thrace and Macedonia and in 1246 capturing Thessalonica from the Greeks of Epirus.

Michael I Komnenos Doukas (1205–15) was the illegitimate son of John Doukas and the cousin of Alexios III. For a short time in 1204 he was in the army of Boniface of Montferrat, but left to lead Greek resistance in Epirus. Epirus had become a refuge for many who could not come to terms with the Franks and there was something of the fanatic about Michael's attack on the Latins in Thessaly. By 1210 he had recovered many towns from Latin control and had treated captured Latins with marked brutality. His brother and successor Theodore (1214–30) captured Ochrid (1216) and Thessalonica (1224). The Latin emperor Peter de Courtenay sought to relieve Epirot pressure on Constantinople by proceeding to his capital along the Via Egnatia with his force of 5000 troops. Somewhere along the way he was captured by Theodore and died in prison. Until defeated at Klokonitsa the Epirot Greeks seemed poised to recapture Constantinople itself. Their loss of Thessalonica to the Greeks of Nicaea effectively left the leadership of the Greek resistance in Nicaean hands.

Despite this instability in the north Aegean states, the principality of Achaea and the lordship of Athens and Thebes enjoyed some stability, with secure frontiers and an uninterrupted succession of rulers. The principality of Achaea certainly flourished and in the 1240s was able to offer substantial naval and financial support to the beleaguered Latin empire. In 1259 Prince William of Achaea (1246–78) formed an alliance with the rulers of Epirus to counter Nicene Greek expansion into Macedonia. At Pelagonia his army was deserted by the Epirots and was surrounded and defeated by the Greeks of Nicaea. William and many of his leading knights were captured. On 25 July 1261 the Byzantines recaptured Constantinople itself. Prince William ceded the towns of

Monemvasia, Mistra, and Maina. From then onwards the Frankish position in Greece was to be a defensive one, down to the extinction of the principality of Achaea in 1430.

The Venetians too gained much territory by the partition of 1205. In 1206 they began the conquest of Crete and licensed scions of noble Venetian families to set themselves up as rulers of the Aegean islands. Marco Sanudo became Duke of the Archipelago based upon the islands of Naxos, Paros, and Syros, while his cousin Marino Dandolo set himself up as lord of Andros. In Constantinople itself the Venetian *podestà* (chief magistrate) took the title of "*podestà* and despot of the empire of Romania and lord of a quarter and a half of a quarter of the same empire". There were plans at least among some of the Venetians in Constantinople for independence from the mother city, but such moves were quashed, and the title passed to the doge by 1217. In the Aegean the Venetians maintained two sorts of possessions – colonies like Crete, Corfu, Korone, and Methone, which were administered by officials sent out from Venice, and the *condominia*, which were conquered by private enterprise but ruled by Venetian noble families. The former saw the Greeks treated as subjects, with occasional revolts against Venetian rule. The latter were marked by the policy of accommodation and concession prevalent in the Frankish states of mainland Greece. With the exception of Corfu (lost to Epirus in 1214) Venetian occupation of these territories lasted well into the 15th century and in the case of Crete was to persist until 1669.

There was a third Greek successor state to the Byzantine empire, namely the empire of Trebizond, set up in 1204 by Alexios and David Komnenos with the help of Tamara of Georgia. The new empire was more a symptom of the fragmentation of Byzantine power in the late 12th century than a reaction to the Latin conquest. Alexios fled from Constantinople in September 1185 when his relative Andronikos I (1183–85) was dethroned. Alexios was criticized by Niketas Choniates for taking no action against the Latins in Constantinople. Isolated as they were and surrounded by enemies, the emperors of Trebizond concentrated their energies on survival, acknowledging the suzerainty of Seljuks, Mongols, and Ottomans in turn. The empire was to last until 1461, when it was incorporated in the Ottoman empire.

Political History 1261–1453

In the period 1261–1453 the Byzantine empire was beset by a variety of internal problems and external crises which eventually led to the disintegration of the state and to the fall of Constantinople to the Ottoman Turks in 1453. It is necessary, however, to make a distinction between the first part of the period (1261–*c.*1350), when the state was relatively strong and prosperous, and the second half (*c.*1350–1453), when Byzantium was reduced to an "empire of the straits" as a result of civil wars and loss of territory to both Turks and Serbians.

The period began with high hopes following the triumphal entry into Constantinople of Michael VIII Palaiologos (1261–82) who removed form the throne the last Laskarid emperor, John IV (1258–61), and established the rule of the longest-lasting dynasty in Byzantine history, the Palaiologans (1261–1453).

The recovery of Constantinople had some important political consequences for Byzantine foreign policy. For one, it displaced the focus of interest of the Byzantine rulers from Asia to Europe. The papacy, Charles of Anjou, the French royal house of Valois, and the Venetians all became engaged between 1261 and 1314 in various efforts to retake Constantinople. In Michael Palaiologos' day, Charles of Anjou, brother of the French king Louis IX and master of Sicily, led a coalition including the despot of Epirus Michael II Angelos (*c.*1231–71) and the kings of Serbia and Bulgaria. Michael VIII deflected the coalition through a major concession on his part and masterful diplomacy. The concession was the Union of Lyons in 1274, according to which Byzantium recognized the primacy of the Roman Church. The papacy forced Charles of Anjou to abandon his plans for a time, but in 1281 pope Martin IV decided that Michael VIII had not really implemented the union and gave his full support to Charles of Anjou. The diplomacy of Michael VIII again prevented a Western expedition against Constantinople; he entered into negotiations with the king of Aragon and others, contributing significantly to the attack of Aragon on Sicily occasioned by the Sicilian vespers in 1282. Michael VIII's heir, Andronikos II (1282–1328), who repudiated the Union of Lyons, had to face yet another Western coalition in 1308–14, but good diplomacy and sheer luck saved the day. The matrimonial policy of the Palaiologan emperors also served the purpose of thwarting a possible Western attack on Constantinople. Andronikos II took as a second wife Irene/Yolanda of Montferrat, and his heir Andronikos III (1328–41) married Anne of Savoy.

The increasing involvement of the Byzantine empire in the West meant a more active Balkan policy vis-à-vis the despots of Epirus and Thessaly. It was, however, only in the first half of the 14th century that the emperors of Constantinople succeeded in subjugating the despotate of Epirus and the independent rulers of Thessaly. The city of Ioannina recognized Byzantine overlordship in 1318 and the rest of Epirus submitted in 1340. Thessaly was acquired piecemeal in 1333. In 1348, however, both Thessaly and Epirus fell into the hands of the Serbian emperor Stephan IV Dushan, and were never again fully reunited with Constantinople. In the Peloponnese the process of reconquest from the Latin principality of Achaea continued throughout the period; after 1349 the Byzantine

38. The Byzantine empire and its neighbours in 1350

possessions were organized as the despotate of the Morea, which became one of the most vital parts of the state.

The necessity for an active policy in the west led to neglect of the eastern boundaries of the empire that proved to have disastrous consequences in the long run. Michael VIII overtaxed the border soldiers (*akritai*) on the Byzantine–Turkish frontier and even withdrew troops from there for his western campaigns. The Turks themselves were in a condition of political and social turmoil after the collapse of the Seljuk sultanate of Rum under Mongol pressure. A powerful Turkish migratory thrust led to the collapse of the Turkish–Byzantine frontier in the late 13th century. The emperors in Constantinople became seriously involved with the problem too late and could do too little. Andronikos II made a number of efforts to remedy the situation: he personally campaigned in Asia Minor in 1282 and tried to mitigate the pro-Laskarid sympathies of the population of Asia Minor by visiting the blind John IV in his prison in 1290. The military successes of the able general Alexios Philanthropenos were shortlived and the rebellion that he led in 1295 ended his career. The Byzantine defeat at Bapheus, near Nicomedia, in 1302 by a Turkish force led by Osman brought the Ottomans to the fore for the first time. The Ottomans took Bursa in 1326, Nicaea in 1331, Nicomedia in 1337. Further to the south Ephesus, Miletus, and Sardis fell to

the Seljuk emirates in the first decade of the 14th century. In a misguided effort to halt the advance of the Turks, Andronikos II in 1303 hired the Grand Catalan Company, a group of undisciplined Spanish mercenaries who soon turned against their Byzantine masters, laying waste to Thrace, Mount Athos, and Thessaly, and eventually establishing the Catalan Duchy of Athens (1311–88) in place of the Frankish lords who had hitherto ruled Attica and Boeotia.

The territorial contraction of the empire and the decrease of its tax resources led to a feeling of restlessness among the powerful landed aristocracy. The Byzantine political elites became increasingly prone to support rival candidates for the imperial throne who promised high material rewards and tax exemptions to their followers. This competition for the diminishing resources of the state fuelled two major civil wars in the first half of the 14th century and exacerbated succession conflicts in the second half. The first civil war (1321–28) between the two Andronikoi, Andronikos II and his grandson Andronikos III, began when the former decided to disinherit the latter because of an amorous escapade that had led to the murder of his brother. Andronikos III was joined in his struggle against his grandfather by prominent aristocrats, such as the future emperor John Kantakouzenos, and succeeded in 1328 in ousting the old Andronikos. Andronikos III (1328–41) achieved the annexation of Thessaly and Epirus to the empire, and in 1333 joined an anti-Turkish alliance with Venice and the Latin lords of the Aegean. The promise of his short reign, however, remained unfulfilled after his death due to the onset of the second civil war (1341–48) which had even more disastrous consequences for the body politic than the first one. It was fought between the regency government of John V (1341–91), including his mother Anne of Savoy, the patriarch John XIV Kalekas, and the admiral of the fleet Alexios Apokaukos, on the one hand, and John VI Kantakouzenos (1347–54), on the other. Both parties in the conflict claimed to represent the rights of the young John V Palaiologos and, when John Kantakouzenos eventually entered Constantinople in triumph, he ruled in the name of the legitimate Palaiologan emperor.

The second civil war saw social conflicts on a scale unprecedented in Byzantine history. Before declaring himself co-emperor in the Thracian town of Didymoteichon, John VI Kantakouzenos had sent letters to prominent men in the cities, seeking their support; when his letter was read on 27 October 1341 in Adrianople, three men, one of whom was certainly a merchant, aroused the people of the city, who attacked the aristocrats and burned their houses. The civil war spread rapidly to the cities of Thrace and Macedonia. The most acute aspects of social conflict were visible in Thessalonica, where the opposition to Kantakouzenos was led by the Zealots, a group with radical social views that ruled the city from 1342 until 1349. Although the social alignments in this civil war are not always easily drawn, the main lines of division are clear. The merchants, perhaps the bankers, certainly the sailors, and in general the people whom contemporary authors call *mesoi*, i.e. the middle classes, supported the regency government. The landed aristocracy sided primarily with John VI Kantakouzenos, the winner of the civil war. Kantakouzenos was crowned co-emperor again in Constantinople in February 1347 and married his daughter Helen to John V Palaiologos. His victory was, however, bittersweet.

In his brief reign (1347–54) Kantakouzenos failed to stop the advance of the Serbians, his erstwhile allies during the civil war. By the middle of the 14th century the empire of Stephan IV Dushan (1331–55) stretched from the Danube to the gulf of Corinth, with only the city of Thessalonica remaining in Byzantine hands. In the second civil war and during his rule as a sole emperor, Kantakouzenos regularly used Turkish mercenaries, who thus became familiar with the rich resources offered by the Balkans. Kantakouzenos had employed first the emir of Aydin, Umur pasha, but subsequently concluded an alliance with the Ottoman house that was cemented by the marriage of his daughter Theodora to the Ottoman ruler Orhan (1326–62). In 1354 John V forced Kantakouzenos's abdication and assumed sole power over the greatly reduced territory of the empire consisting of Constantinople, Thrace, Thessalonica, parts of the Peloponnese, and Philadelphia and its immediate surroundings in Asia Minor. Both financially and politically the Byzantine empire was a ruined state.

The middle of the 14th century marks a break not only because of the territorial reduction of the Byzantine state, but also due to the rise in political influence and prestige of the Orthodox Church. Unlike the imperial office, the Church emerged unscathed and even strengthened from the period of the civil wars. The heightened prestige of the Orthodox Church enabled it not only to command the spiritual allegiance of the people, but also to fill the political vacuum left by the decline of the state's institutions. The Church had grown as a judicial institution since the reign of Andronikos II, who reformed the supreme court in 1296 to include ecclesiastical judges. In the second half of the 14th century the ecclesiastical courts grew in power and met much more regularly than the imperial ones. The rise of Church power in this period was, however, chiefly due to the revival of monasticism. The monasteries of Mount Athos had been detached from imperial control since November 1312, but it was the hesychast belief in the possibility of contemplating the divine light through rigorous asceticism that gave a new impetus to Orthodox monasticism. The monastic theology of hesychasm triumphed in two councils of Constantinople, the first in 1341 pronouncing the orthodoxy of the teachings of Gregory Palamas and condemning those of Barlaam and Gregory Akindynos, the second one in 1351 denouncing the opposition of Nikephoros Gregoras. Hesychast monks, such as Kallistos I (1350–54 and 1355–63), Philotheos Kokkinos (1354–55 and 1364–76), and Neilos (1380–88), captured the patriarchate during the second half of the 14th century and often influenced the will of emperors.

The middle of the 14th century marks also a new stage in the advance of the Turks. In 1354 the Ottomans acquired their first permanent foothold in Europe, the fortress of Tzympe in the Gallipoli peninsula. A fortunate accident allowed the Ottomans to capture the fortress of Gallipoli itself in 1356 after an earthquake had damaged its walls. From this time onwards, the Ottomans assumed control of the Dardanelles and crossed regularly into Europe. Philippopolis was conquered in 1363 and Adrianople *c.*1369. The most that John V could do was to seek closer ties with the West in the hope of a crusade. He journeyed to Hungary in 1366 and in 1369 to

Rome, where he declared his personal conversion to Catholicism. On his way home he was detained in Venice because of his debts and was forced to promise the cession of the island of Tenedos in the Sea of Marmara to the Venetians. The only result of John V's diplomatic efforts was the expedition of Amadeo of Savoy which restored Gallipoli to the Byzantines for ten years (1366–76).

The Ottoman advance, however, did not propel Byzantium into coalitions with other Balkan powers. In 1371 the brothers Vukasin and John Uglesa, rulers of Slavic principalities in Macedonia that emerged after the disintegration of Stephan Dushan's empire, were defeated by the Ottomans at the battle at Chernomen on the Maritza river. This Turkish victory opened up the Balkans for further Ottoman conquest. After the Battle of Maritza John V sought an accommodation with the Turks and became an Ottoman vassal obliged to join the sultan in his military campaigns. The desperate situation in the last years of John V's rule was further aggravated by the rebellions of his son Andronikos IV (1373, 1376–79) and his grandson John VII (1391). Thessalonica submitted to the Ottomans in 1387 and Thessaly in 1393. As an Ottoman vassal, the future emperor Manuel II (1391–1425) had to accompany Sultan Bayezid I "the Thunderbolt" (1389–1402) on campaigns in Anatolia and witnessed the conquest of Philadelphia, the last independent Byzantine city in Asia Minor. The Ottoman blockade of Constantinople began in 1394 and seemed to spell the imminent fall of the imperial capital.

Nevertheless, the life of Byzantium was prolonged almost miraculously for 50 more years. A Mongol army under the leadership of Timur invaded Asia Minor from the east and dealt a crushing blow to the Ottomans at the battle of Ankara on 28 July 1402, taking into captivity Sultan Bayezid himself. The civil war that broke out among Bayezid's four sons allowed Byzantium a much-needed breathing space. Manuel II Palaiologos, who had been in the west since 1399, returned immediately to Constantinople. An energetic ruler as well as author of numerous literary works, Manuel II negotiated the recovery of Thessalonica and supervised the reconstruction of the barrier walls across the isthmus of Corinth protecting the despotate of the Morea. In the first half of the 15th century the Morea became the most viable part of Byzantium and a centre of Hellenic revival exemplified in the ideas of the philosopher and political thinker George Gemistos Plethon (*c.*1360–1452). Its capital Mistra witnessed a remarkable cultural and artistic renaissance similar to the one that had occurred in Constantinople in the early 14th century. While the capital of the empire was slowly dying, the despots of the Morea managed to extend their boundaries. Manuel II's three sons, the despots Theodore, Constantine, and Thomas, succeeded in conquering the Latin principalities in the northern part of Peloponnese in 1430–32.

In the meantime, the Ottomans had renewed their expansionist policies. Constantinople was besieged in 1422 and the Byzantine empire became a vassal state of the Ottomans again in 1424. Thessalonica fell for a second and last time to the Turks in 1430. Manuel's son and heir John VIII (1425–48) again pursued a rapprochement with the West in order to ward off the Ottoman advance. He personally participated in the Council of Ferrara-Florence in 1438–39, where he signed the decree of union recognizing the primacy of the Roman Church. The Union of Ferrara-Florence, like the Union of Lyons a century and a half earlier, met with strong popular opposition. Moreover, the crusade of 1444 triggered by the union never reached Constantinople, but was crushed by the Turks at Varna. John VIII's brother Constantine XI Palaiologos (1449–1453), the last ruler of the Byzantine empire, accepted the Union of Ferrara-Florence in the hope of gaining military assistance from the West. He did not implement the union, however, until the eve of the Ottoman conquest, on 12 December 1452. Constantine XI Palaiologos fought bravely during the Ottoman siege of Constantinople and perished in the final battle on 29 May 1453. The despotate of the Morea survived the conquest of Constantinople by exactly seven years; Mistra fell to the Ottomans on 29 May 1460. Trebizond, the last outpost of independent Hellenism, submitted to the Turks in 1461.

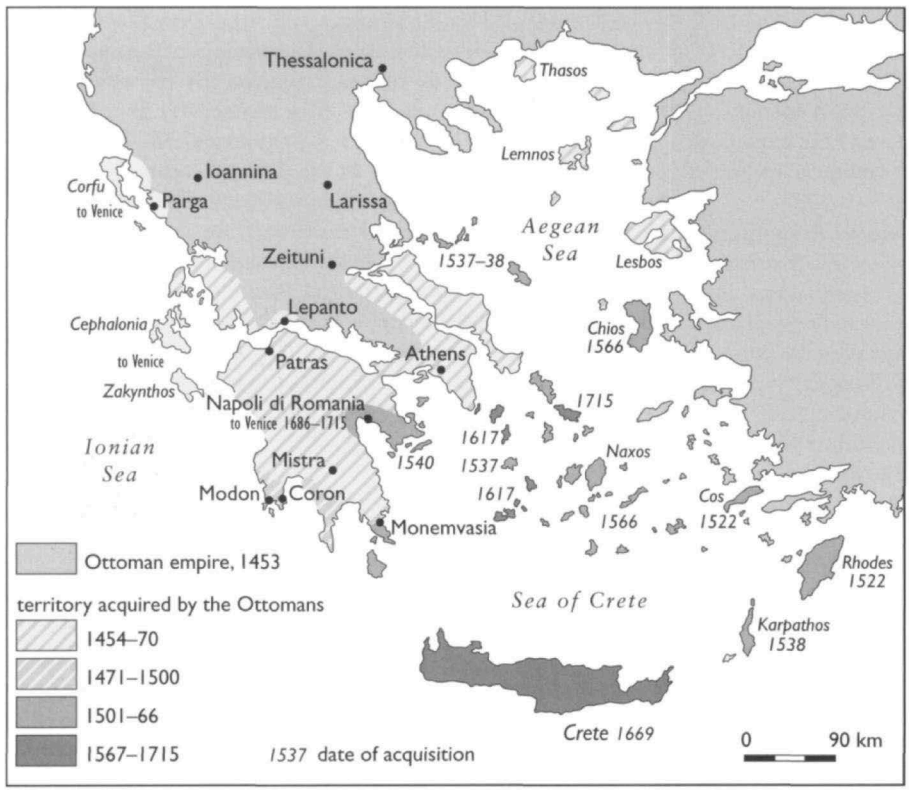
Political History 1453–1832

Those who seek the unbroken thread of the Hellenic tradition may find it at its most tenuous, and therefore vital, in the Ottoman period, when the Greeks had no political history. Even the conventional dates are unhelpful. True, in May 1453 the 21-year-old Sultan Mehmet II conquered Constantinople, when Constantine XI, last Byzantine emperor "of the Romaioi", died. True, in August 1832 the 16-year-old Bavarian prince Otto accepted the throne as king Otho of the "Hellenes" of Greece. But the dates are inconsequential and all the two Christian rulers had in common was that they acknowledged the ecclesiastical supremacy of Rome, while most of their Orthodox subjects did not. In fact most "Greek"



39. Greece under the Ottomans

Orthodox had been secular subjects of the Ottoman state for some decades before 1453 and were to remain so for some decades after 1832. But that did not make the Ottoman empire Byzantium with a turban either, despite their common lands and peoples. A surer link between the Byzantine and Ottoman empires was an attitude to empire. In a pre-nationalist world, neither existed for the convenience of its subjects. Each used an administration in Constantinople with the simplest aim of best exploiting its resources: to maintain or extend its empire by diplomacy, threat, or so far as a summer campaign could be supplied – which for the Ottomans stopped at Vienna in 1529 and 1683. In both the Byzantine and Ottoman empires the capital was the source of patronage. For example, Cyprus was for Byzantine administrators until 1191 and for Ottoman administrators from 1571 neither "Greek" nor "Turkish", but a medium-rank posting from the capital, like Bengal in the Indian Civil Service in the British empire.

Along with an administrative capital, Mehmet II (1451–81) also inherited religious and legal duties as a Muslim sultan, one of which was the recognition and protection of his *dhimmis*, or non-Muslim subjects. In 1454 Mehmet came to a settlement with his first chosen patriarch, Gennadios II Scholarios (three reigns between 1454 and 1465), who, unlike the last emperor, had rejected the union of the Roman and Orthodox Churches signed at Florence in 1439. The arrangement in effect defined a Greek as a religious subject of the patriarch who was responsible to the sultan, and in return for economic concessions gave the patriarchate extensive legal control of its flock. This settlement came only just in time to save the Greeks, for while those areas which the Turks had conquered since the 11th century had been largely Islamicized with the loss of the economic base of the Byzantine Church and state, the areas conquered after the settlement (e.g. much of the Balkans, the Morea in 1458, the Pontus in 1461, Cyprus in 1571, Crete by 1669) remained largely Christian. But for the momentous settlement of 1454, and subsequent ones between the Ottomans and the Armenian and Jewish communities, no contemporary documents survive. What is known only emerges in retrospective Greek tradition by 1520, and probably owes as much to wishful thinking of the benevolence of Mehmet II on the part of all parties (Ottoman included) as to its codification by the lawgiving sultan Suleyman I (1520–66), during whose reign the settlement largely worked its way through.

The tradition, and, until recently, modern historiography, is that Mehmet II and Gennadios created a *Millet-i Rum*, or semi-autonomous non-Muslim community, governed through the ecumenical patriarch. Neither sultan nor patriarch can really be described as Renaissance figures. Mehmet may have collected icons, employed Bellini, and discussed theology with Gennadios in Greek, but his "mightiest war", as he put it, was to make Constantinople a Muslim capital. Similarly, Gennadios may have been willing to compromise (he could do no other), but his writings are of conventional polemic impartially against Islam and Rome, and also demonstrate that the end of the world was to come in 1492 – a date then understandably postponed in popular Greek tradition to 1772. The mindset that sultan and patriarch shared was medieval. History is about practice rather than origins and all parties have found it convenient to let sleeping myths lie, for the *Millet-i Rum* worked that way in the end, and sounds logical, for Mehmet had the example of centuries of Islamic experience of dealing with non-Muslim minorities (and majorities) under the caliphate behind him.

However, the settlement was not preordained. Mehmet's first action on taking Constantinople was to execute his own prime minister, an almost hereditary post in the Anatolian Candaroğlu dynasty – henceforth his ministers were mostly converts who tried ever harder to please. His second action was not to turn to the patriarch (who in any case was in Rome) as his agent to deal with his Greek subjects, but to the last Byzantine prime minister, Luke Notaras, who famously preferred the turban of the sultan to the tiara of the pope. Notaras, however, was executed, and only then did the sultan seek out Gennadios as his patriarch and agent. Armenian and Hebrew traditions have it that he made similar arrangements to set up an Armenian patriarch of Constantinople in 1461, and a Jewish *haham* is claimed by 1492 – dates certainly too early, but such officers were in place by 1520. The point is that the Ottomans created Christian and Jewish institutions which had not hitherto existed, in order to keep their eye on a head of community in the capital. The very patriarchate of

Constantinople must be put in this category. In 1454 it was an Ottoman recreation on Ottoman terms. It is not known what Mehmet and Gennadios discussed, but they cannot have called it a *millet*, for the term was unknown to them. The conqueror and canonist may have been talking past each other, but in effect they seem to have made up a *Millet-i Rum* as they went along. The determinants were Constantinople and *Rum*. Constantinople makes the political history of the Greeks from 1453 to 1832 quite literally the history of the polis, or of the City; but while all Greeks, and by definition no Armenians, Jews, or Latins (who were without the law), were *Rum*, not all *Rum* were Greeks, for they included Slav, Arab, and other Orthodox subjects of the sultan and patriarch in Constantinople – to an extent that national risings after 1832 were as much against patriarchs as sultans, for the sees and churches of Jerusalem (1520), Antioch (1720), Peć (1760), and Ohrid (1767) fell in turn to the patronage of Constantinople. While the settlement of 1454 defined who a *Rum* was, it allowed a Greek-writing mandarin class to enter Orthodox service, whatever their origins – just as the Byzantine empire had done. But while terms such as "Hellene" only meant something on paper after 1832, Mehmet and Gennadios knew, without using it, what a "Greek" was in 1454, and the Greeks learned how to use the Ottoman patriarchate to establish a cultural control over other Orthodox subjects of the sultan.

Among the arts of the underdog, Ottoman patriarchs soon learnt how to use, if not raise, the *peşkeş*, or bribe of office, first voluntarily offered to the sultan by patriarch Symeon of Trebizond (three reigns between 1467 and 1486). The system percolated down to equivalent bribes offered for patriarchal patronage of his own sees and led to a spiralling of the cost of Constantinople, which did not produce many great shepherds in the revolving post, whose *peşkeş* their lay flock largely paid. Among the most impressive was Cyril I Lukaris (six reigns between 1612 and 1638) whose great rival was Cyril II Contari (three reigns between 1633 and 1639). If the Church was for auction, rival Western commercial and political interests found it a way into the Ottoman system. Cyril Lukaris, the so-called "Protestant Patriarch", was sponsored by Protestant, and Cyril Contari by Catholic, powers, who encompassed Lukaris's murder in 1638, of which Archbishop William Laud of Canterbury was concerned for further details before he was in turn executed in 1645.

Greeks outside Constantinople found opportunities within the Venetian empire, in Cyprus until 1551, Crete until 1669, the brief Venetian reconquest of the Morea thereafter, and in the Ionian islands until 1797, contributing, like El Greco (Domenikos Theotokopoulos), to a European culture which knew the Renaissance, Reformation, and Counter-Reformation. But this entry concerns their political history in Constantinople, not just the polis but the patriarchal quarter in the Phanar on the Golden Horn, where Phanariots entered the Ottoman civil as well as patriarchal service, as Grand Dragomans from 1661 and as rulers of the Danubian tributary provinces of Moldavia (from 1709) and Wallachia (from 1714) on the same, if more elaborate, terms that the patriarchate could obtain. All such slave princes endowed the Orthodox Church at the expense of their Romanian subjects, and some caught and promoted the Enlightenment too. But in Constantinople both Phanar and Church, Porte and *ulema* (the body of religious scholars) were at one, not with the *Revolutionary Proclamation* of Rigas Velestinlis (1797), but with the *Paternal Exhortation* under the name of the patriarch Anthimos of Jerusalem (1798): "When the last emperors of Constantinople began to subject the Eastern Church to papal thraldom, the particular favour of heaven raised up the Ottoman empire to protect the Greeks against heresy, to be a barrier against the political power of the Western nations, and to be a champion of the Orthodox Church."

If there had been any Greek readers of both Rigas and Anthimos, they would have been found among such burgeoning Greek commercial centres as Marseilles, Odessa, Bucharest, and Smyrna (where at nearby Kydonia (Ayvali) there was indeed a rising). But in 1821 the revolution began with the crossing of the river Pruth from Russia to modern Romania by Prince Alexander Ypsilantis to restore a "Great Idea" of Byzantium. The Romanians would not have it. On 25 March 1821 the metropolitan of Patras raised another banner in the Morea, where factors were quite different. It looked as if the southern Balkans were to fall apart under local warlords, such as Ali Pasha of Ioannina (1741–1822). Patriarch Gregory V (three reigns between 1797 and 1821) could only condemn the rising in the Morea and sultan Mahmud II (1808–39) could only hang his patriarch from his gate in the Phanar on Easter Sunday, 15 April 1821. In 1827 the untoward Battle of Navarino led to the independence of Greece, and in fact of Egypt, then unwanted by all parties. Politically, the upstart new state of king Otho was excommunicated by Constantinople until 1850, by when whatever understandings had been made between sultan and patriarch in 1454 entered a final phase. Patriarch Gregory V was canonized as a saint in Athens in 1921, but patriarchs Gennadios Scholarios and Cyril Lukaris await similar recognition.

Political History since 1832

Greek political history since 1832 has indeed been turbulent. During these 170-odd years Greece has had six constitutions, the form of the regime changing from authoritarian regency and monarchy (1832–44), to constitutional monarchy (from 1844), to republic (1924–35), back to monarchy (1935–74), and again to republic (from 1974). The country's political history is further studded with around half a dozen successful or attempted coups, military or with military involvement (1909, 1922, 1923, 1925, 1933, 1935), two periods of dictatorship totalling a little over 11 years (1936–41, 1967–74), a long and destructive civil war (1946–49), and other periods of anomalous or irregular democracy. Yet, despite these events, Greek political history shows that the democratic system adopted by the country during the 19th century has enjoyed great legitimacy and popular support and has exhibited considerable resilience. Of course, this does not make Greece into an exemplary democratic state: repression, vote-rigging, even intimidation of opponents have at times been features of Greek political life, even up to the 1960s. This is explainable if it is taken into account that the system of government imported into Greece in the 19th century had to coexist with a much older and deeply embedded system where patronage and clientelism were the norm; and at the same time it was subject to "royal intrusions". The nature of Greek society (traditional and pre-industrial in the 19th century) and the lack of a staged evolution of democracy, along with the inevitable (regional and world) wars, economic crises, and internal upheavals, were to create tensions that manifested themselves as regime instability and turbulence in Greek political history.

The Treaty of London (1832) established an independent and "monarchical" Greek state whose crown was given to Otho, second son of king Ludwig of Bavaria. A three-man Bavarian regency ruled Greece until 1835 (when Otho came of age) in a highly authoritarian manner, showing little respect for Greek tradition and customs. Their rule (not least their handling of religious issues) caused resentment both among the common people and to the political and military elites, which considered themselves entitled to a share of power. A further problem was the constitutional question. A constitution had been promised by the Protecting Powers, and confirmed again in 1832; yet both the regents and Otho, despite domestic and external pressure, refused to grant it. However, on 3 September 1843 a popular uprising forced Otho to grant a constitution. The 1844 constitution established Greece as a democracy. Constitutional government did not significantly improve Otho's popularity; nor did it at first significantly alter the rules of the political game: elections in 19th-century Greece were often conducted in an atmosphere of irregularity and even violence, and Otho continued to intervene in politics.

Otho was deposed in 1862, by an uprising in the capital. His fall was the result of popular discontent with both his foreign policy and his domestic governance. He left Greece in October 1862. Otho's deposition was followed by a period of anarchy, while the Protecting Powers were looking for a suitable replacement. Prince Christian George of Denmark accepted the throne and in 1863 became George I, king of the Hellenes. Greek politics remained unstable: between 1864 and 1910 there were 42 general elections and 140 governments; Charilaos Trikoupis became prime minister seven times between 1875 and 1895. Between 1863 and 1909 Greece suffered a bankruptcy (1883) and a disastrous war with Turkey (1897), but also acquired the Ionian islands (1864) and Thessaly (1881). The Great Idea remained the main theme of Greek politics, but was now joined by the need for modernization. This period is characterized by an expansion of democracy, though the king retained considerable powers that provided the means for royal interventions. An important political development was the consolidation and regularization of democracy and its institutions. For a sizeable part of his reign a bipolar party system operated, with a stable if frequent alternation of the major parties in power. Another major development was the adoption of the principle of *dedilomeni*, a stipulation that the king has to invite the leader of the party with a majority in Parliament to form a government.

The year 1909 marks the first significant military intervention in politics. Pressure for modernization at home, exasperation at royal patronage, and fear of the effects of the Young Turk revolution in the Ottoman empire had been building up. In the summer of 1909 officers belonging to the Military League staged a pronunciamento. The army's demands and grievances were expressed in very moderate terms; surprisingly, the people quickly and openly embraced them, and the government and king equally quickly surrendered to the coup. Lacking the experience to govern, the Military League invited the Cretan politician Eleftherios Venizelos to assume the government of Greece (January 1910). Venizelos presided over a period of intense preparation for the conflict with the Ottoman empire that everybody expected. Venizelos's party, the Liberals, was dominant in parliament in all electoral contests between 1910 and December 1915. The successful conduct of the Balkan Wars was as much the result of careful preparation as of cooperation between Venizelos and George I. The assassination of the latter and the succession of Constantine were to end this. Constantine's intervention in politics in 1915 led to the painful period of the national schism. Venizelos and the king became two mutually exclusive poles. The nation and the country were deeply divided, and even a physical division took place when Venizelos formed the provisional government. The division of the country (but not the people) ended in 1917, when Constantine was deposed by Entente forces. He appointed his second son, Alexander, to succeed him.

Upheaval continued during the period 1917–36. Greece participated in World War I, and gained considerable territories in Thrace and Asia Minor, bringing closer the realization of the Great Idea. However, the country was still deeply divided between royalists and Venizelists; after Constantine's departure in 1917 Venizelos had recalled the parliament elected in June 1915. The death of king Alexander (October 1920) caused a political and constitutional crisis; Venizelos's fateful decision to find a solution by elections led to his defeat in November 1920. The victorious Populist Party quickly organized a referendum for the return of Constantine (December 1920), where the Liberals abstained. Constantine returned to Greece the same month. Purges of Venizelos's supporters now took place.

The Populists were to preside unwillingly over the territorial liquidation of the Great Idea. While the Gounaris govern-

ment decided to continue the war against Mustafa Kemal's nationalists in Asia Minor (begun in 1919), war fatigue, the withdrawal of financial support by the Entente, and Italian and French hostility led to the collapse of the front in Asia Minor and the 1922 disaster, with over a million destitute refugees arriving in Greece.

The defeat and the subsequent exchange of populations further radicalized Greece. In September 1922 the army revolted in Chios under the leadership of colonel Nikolaos Plastiras and marched on Athens; the government collapsed. A revolutionary committee, formed by a group of officers, assumed power. King Constantine abdicated and left Greece; crown prince George briefy became king. Six politicians (among them Dimitrios Gounaris, the former prime minister) and a general were accused of high treason, tried by a revolutionary court martial, sentenced to death, and executed in November 1922. The revolutionary committee defeated a royalist coup, following which George II had to leave Greece "on leave" (December 1923). The same month elections (from which the Populists abstained) produced a Liberal-dominated parliament, with a strong republican minority that pressed for the abolition of the monarchy. In January 1924 the revolutionary committee handed power back to civilians and dissolved itself. Government instability as well as popular anti-monarchist feeling (the monarchy had been associated with the Asia Minor debacle) allowed the republican minority to advance its aims: Greece was made a republic on 25 March 1924, an act retrospectively confirmed by a referendum three weeks later. Two-thirds of the electorate voted in favour of the republic; however, the royalist parties (as well as George II) refused to accept the regime change.

Instability continued under the republic. In June 1925 general Theodoros Pangalos overthrew the government and concentrated power in his own hands. He was himself overthrown by general Georgios Kondylis in August 1926. An all-party government was formed in November 1926 and surprisingly survived in different forms until the summer of 1928. However, the return of Venizelos to Greece in March 1928 hastened its fall. Venizelos resumed the leadership of the Liberal Party, and in July 1928 was invited to form a government. He won the elections held in the same month and those of September 1932 and January 1933. Venizelos governed Greece until March 1933. Another period of instability followed, laced with two abortive republican coups (March 1933 and March 1935). Venizelos, declared the nominal head of the second coup, had to leave Greece for France, where he died a year later.

Liberal and republican abstention in the elections of June 1935 produced a parliament monopolized by the royalists. Panayis Tsaldaris, the leader of the Populist Party, formed a government, but a putsch replaced him by Kondylis (October 1935), who hastily organized a referendum for the return to monarchy. The referendum of November 1935 was clearly rigged: 97 per cent of the votes were in favour of the monarchy and there were many reports of irregularities. Nevertheless, George II returned to Greece the same month. The January 1936 elections produced a hung parliament, with the balance held by the 15 communist deputies. The Communist Party of Greece (KKE) had been making limited progress since it was founded in January 1918; now it assumed centre stage. Workers' unrest in May 1936 and a general strike announced for 5 August 1936, both endorsed by the KKE, provided Ioannis Metaxas with the pretext for establishing a dictatorship.

Metaxas, leader of a marginal political party, had been appointed caretaker prime minister in April 1936, while negotiations for the formation of a coalition government were taking place. Metaxas's appointment had been aided by the death (by natural causes) of several major politicians (Kondylis, Demetzis, Venizelos, and Tsaldaris all died between January and May 1936) and also by the army's confidence in him. With considerable naivety the parliament had allowed him to rule by decree, initially for five months. On 4 August 1936, using as pretext the "communist danger", Metaxas with the consent of the king dissolved parliament, suspended the constitution, and declared martial law.

The "Regime of 4 August" which Metaxas founded proved quite durable. It remained in power until his death (January 1941) and even afterwards its rule was only relaxed. It was

characterized by political repression all round, with communists singled out for particularly harsh treatment.

The mainstream political parties remained in suspended animation throughout the 1936–44 period; the Metaxas dictatorship and the war and Axis occupation that followed did not allow for traditional political activity. The one exception was the KKE which, through its role in the resistance, emerged as a major player in the political game.

In 1944, after a series of crises in the Greek government-in-exile, an agreement (brokered by the British) was reached, creating a coalition government with communist participation, under George Papandreou. The coalition broke up in December 1944, during what is often seen as the half-hearted communist attempt to seize power. A series of weak and short-lived governments followed.

The single most serious political issue that dominated Greek politics during the Axis occupation was the future of the monarchy. Until 1944 George II had refused to accept a referendum as the means to decide the issue; nevertheless, the referendum was held in September 1946, after the national elections in March 1946 (where the KKE had abstained) had given a clear majority to the Populist Party. The referendum, held in a climate of disorder, resulted in the restoration of the monarchy. George II returned to a country sliding quickly into a bloody civil war that lasted until August 1949.

The post-1945 political scene briefly saw the resurrection of the pre-1936 Liberal/Populist division. The Civil War was fought by a series of governments formed by either or both groups. However, it was becoming clear that the division was weakening. New political forces were emerging: in the 1951 elections a new party, the National Rally (*Ethnikos Synagermos*) under marshal Alexandros Papagos displaced the Liberals and Populists as the largest single party in parliament; another new party that contested the elections was the United Democratic Left (*Enomeni Dimokratiki Aristera*), which was to act as an umbrella for communists and leftists until 1974. The election of 1952 ushered in a decade of rule by the Right. The National Rally ruled until Papagos's death in 1956 and was succeeded by Constantine Karamanlis whose Greek Radical Union (ERE) used National Rally cadres and support. Liberalization, begun under Papagos, continued alongside economic development and reconstruction. The political system came close to a breakdown in 1959, when EDA surprisingly became the largest opposition party in parliament. Though on that occasion the crisis was defused, the army and the Right were seriously alarmed. However, the catalyst that probably deepened the crisis was the victory of George Papandreou's Centre Union in the elections of 1963 and 1964. The army as well as the palace had been alarmed by the prospect of loss of power by the Right; the army felt that anti-communism (almost an institutional ideology after the Civil War) was being questioned by Papandreou. Furthermore, the palace considered the armed forces its exclusive domain and felt threatened by the attempts of the elected government to control them. The protracted government crises of 1965–67 were as much an attempt by the palace to influence politics as the result of multiple fragmentation of the Greek political parties.

The army seized its chance on 21 April 1967, when a group of officers staged a coup. Though the king was probably not informed of the coup, he cooperated with the new regime, swearing in a new puppet government. In December 1967 the king organized his own (abortive) coup. Its failure forced him to leave Greece and allowed the Colonels (after a period of regency lasting until 1973) to proclaim Greece a "presidential parliamentary republic".

The Colonels' regime ruled Greece repressively until July 1974, when the Cyprus debacle forced them to hand power to a civilian government. Karamanlis returned from France to a hero's welcome. He formed a centre-right coalition, presiding over a highly successful transition to democracy. Among his first actions was to legalize the KKE (illegal since 1947). Elections were called for November 1974 (the first in ten years) and were won overwhelmingly by Karamanlis's New Democracy. A plebiscite to decide on the regime issue in December 1974 resulted in favour of abolishing the monarchy. Throughout the 1974–81 period modernization of both society and politics continued apace; a major achievemat of Karamanlis was the entry of Greece to the European Economic Community in January 1981.

The elections of November 1974 and November 1977 were won by New Democracy. However, it became obvious that the Greek political scene was changing rapidly. PASOK, a new party led by Andreas, the son of George Papandreou, contested both elections on a radical leftwing platform, with strong anti-Western overtones. PASOK enjoyed a meteoric rise, becoming the main opposition party in 1977 and coming to power in a landslide victory in 1981. This was the first time a left-of-centre party had come to power since 1944. PASOK rule lasted until 1989. Beginning quite radically, it settled down and by 1986 anti-Westernism had been largely abandoned. PASOK rule quickened the pace of reconciliation and the ending of the Civil War divide, not least by recognizing all national resistance movements. PASOK's main failings were the introduction of rampant populism and reckless economic policies.

A political crisis erupted in 1985 over the election of the president of the republic. Karamanlis had moved to the presidency in May 1980, but resigned in May 1985 when in a surprise move PASOK announced it would not support his re-election. However, despite fears, both the political system and the ruling party proved durable. PASOK's downfall was the result of serious economic problems and corruption scandals involving top-level members of the government. Elections in June 1989 and Novernber 1989 resulted in hung parliaments and produced first a coalition government of the conservative New Democracy and the far-left Alliance of the Left, and then an "ecumenical" grand coalition governmment. New Democracy won the elections of April 1990 and formed a government with a very slim majority; surprisingly it lasted over three years.

In the summer of 1993 Antonis Samaras, a former foreign minister, broke away and formed his own party. The government fell in September. The elections of October 1996 were the last victory for PASOK leader Papandreou. He fell seriously ill in the following month and resigned the premiership in January 1997. He was succeeded as both leader of PASOK and prime minister by Costas Simitis.

Politis, Nikolaos 1852–1921

Anthropologist

Nikolaos Politis is considered the founder of folklore studies in Greece. He founded the Laographiki Etaireia (Folklore Society) in 1905 when the first volume of the journal *Laographia* was also published, in which Politis published an article setting down the epistemic and disciplinary parameters of folklore and delineating the basic operating principles of the discipline.

Politis's life spans the time of the solidification of the modern Greek state, a time during which the basic foundations for the state apparatus and national institutions were laid, alongside the institutional establishment and development of the arts. It was also the period when the most violent and heated debates over the Hellenic character of the modern Greeks were taking place, initially in western Europe and subsequently in Greece itself. These debates, which though resolutely rooted in the development of Enlightenment thought, were precipitated by the political changes and ethnic uprisings that were taking place in the Balkans in the 19th century. The developments in Greece, in particular, were met with a combination of suspicion and philhellenism. Suspicion, because there were many Europeans, ranging from politicians to intellectuals, who believed that modern Greece had no reason to exist because it lacked an organic connection with ancient Greece. Of these intellectuals, Jakob Philipp Fallmerayer was not the only one, although his theory (espoused in his *Geschichte der Halbinsel Morea*, 1830) was the one most vehemently refuted. Philhellenism, because there were just as many European politicians and intellectuals who believed that Greece had an absolute reason for existence despite the fact that it did not have an organic connection with ancient Greece. In either case the end result was the same, namely that ancient and modern Greece comprised two different civilizations, two different nations, two different languages, two unconnected (and not simply disconnected) entities. The debate was not simply academic, as it touched upon issues of the sovereignty of the modern Greek nation state, the political existence of which was debated and seriously threatened.

In this climate modern Greece had to prove that its civilization was indeed a continuation of the ancient one. Initially, the Greek state comprised only a small part of what is Greece today and every expansion and addition was achieved with war, after which the acquired portion had to prove that it belonged culturally and racially with the rest of Greece. This was a problem faced by all newly established nation states, that of Germany included. Germany became important in this framework for three reasons: first because that was the starting point of Fallmerayer; secondly because the most complete and crystallized articulation of folklore came from Germany, through the studies of Herder, Schmidt, Waschmuth, and the Grimm brothers; and finally because Politis studied in Germany, under Bernhard Schmidt, from whom he borrowed the methodology, while he turned to the British, especially Sir James Frazer and Edward Tylor, for the development of his own theory of folklore. Frazer's comparative theory, based on Darwinian evolutionism, and Tylor's theory of cultural survivalism provided the cornerstones of Politis's theory of folklore.

While Politis concerned himself with Fallmerayer's theory, which maintained that modern Greeks were not Greek at all but rather a blend of Slavs and Albanians, it would be a mistake to see Politis's efforts and contributions as exhausting themselves in a battle against Fallmerayer. This was a battle fought by his Greek colleagues in folklore research, primarily Spyridon Zambelios, Emmanouil Vyvilakes, Michail Lelekos, and many more, along with a large number of European and American philhellenes, such as Claude Fauriel, Lord Byron, Grindley Howe, and Edgar Quinet. What Politis effectively managed to do, with regard to Fallmerayer's theory, was to elevate the discussion and the debate from a purely national and political level to one of epistemology. Politis was engaged in a discussion with his European colleagues. It was through the example of Fallmerayer that Politis tried to advance the folklore studies and research already undertaken by the early (and untrained) Greek folklorists. Politis managed to place Greek folklore within the disciplinary framework that had

been established by the European folklorists. Nineteenth-century folklore tried to establish first the universality of the human psyche and secondly the theory that all civilizations operate within an evolutionary scale of their own which allows them to keep their cultural cohesion through the survivals (*epiviomata* was Politis's translation of the term proposed by Tylor) of behaviours and beliefs which, while belonging to earlier times, have divested themselves of their original meanings and have survived as cultural gestures. This process Politis understood as the one that leads to the attainment of truth and reason. He understood the comparative method as the key that would open the dialogue between the previous (barbaric) and later (civilized) points in the process of human civilization.

Prior to Politis's theories, the constructions of the cultural and racial continuities of the Greek nation had been situated within its diachronic linguistic cohesion. Politis, however, who was an erudite and scientifically informed researcher, knew only too well that there was more than one language spoken within the Greek state. He also knew, equally well, that the German romantic theories that viewed national and ethnic cohesion through the framework of linguistic homogeneity had already been tested and disproved in Greece, where many of the various ethnic groups that comprised the Greek nation were at least bilingual. For instance, the Arvanites spoke both Greek and Arvanitika, the Sarakatsans Greek and Romany, the Greeks in Asia Minor and the rest of the Ottoman empire spoke Greek and Turkish, without any dispute or uncertainty as to their Greekness. Politis turned elsewhere for his constructions of the continuities of the Greek nation. He turned to the idea of a common descent of the Greeks, which could be researched and proved through their character, the continuity of which could be shown through a comparison of modern folk models of behaviour with the corresponding ancient ones. In this manner Politis coordinated the orientation of Greek folklore theory with the German and British theories while attributing to it the archaeological texture that still circumscribes folklore as a discipline.

By establishing folklore as a discipline Politis set its epistemological parameters, so that some sort of order would be placed over the practice of folklore, thus guiding future research while delimiting the unscientific and highly individualistic nature of its the practice until then, which had resulted in research of dubious quality and relevance. Politis set out to teach folklorists in Greece what constituted their research object and the principles of classification and recording. The definition of folklore, as suggested by Politis in 1909, occurred in a political climate decidedly different from the one that had marked the beginnings of the discipline in the mid-19th century. The year 1909 was politically marked by Charilaos Trikoupis and his Liberal Party, of which Politis was a member. Ideologically this period was framed not by the archaeolatry which had marked the previous century but by a move forwards, towards the restitution of the state. This promising Greek reality was considered to be the achievement of the people, not of the scholars, and was appropriated by the rising middle classes. By this time the orientation had turned towards folk tradition, and the language of that tradition was the vernacular, the Demotic. The Greek countryside became the point of reference of the intellectuals and the scholars, and the demoticist movement found fervent supporters among the members of the philological circle established by Politis, despite the fact that he was not a demoticist himself. Besides the project of introducing demotic to the curriculum of primary and secondary schools, Politis was very much interested in modern Greek history, especially the period from the revolution of 1821 onwards. As a result of the combination of these interests came the establishment of the Historical and Ethnological Society of Greece which tried to combine historical and folklore research.

These were the official gestures of Politis. Unofficially he coordinated the first attempts at the creation of a demoticist literature in Greece. The poet Georgios Drosinis mentioned in a letter that he sent to Stilpon Kyriakidis that Politis had returned from Germany exhorting Greek intellectuals to apply themselves to a type of art that would be Greek in all of its expressions. With that in mind they established weekly Saturday evening meetings at a German beer tavern where, besides those who belonged to the circle of Hestia, many more came, among them Georgios Vizyinos, Antonis Meliarakis, Dimitrios Kambouroglous, Aristotelis Kourtidis, the gymnast Ioannes Phokianos, and the painter Nikephoros Lytras, among others. From that circle, which also included sculptors and architects, developed the Historical and Ethnological Society. Drosinis also mentioned that Politis encouraged him to write the *Agrotikes Epistoles* (Peasant Letters) and the *Eidyllia* (Idylls) and to make systematic use of his own *Paradoseis tou Ellinikou Laou* (Traditions of the Greek People).

Politis introduced and systematized the scientific approach to the study of Greek culture; he established or edited important journals which provided a forum for scholars and intellectuals of his day to publish their theories and research; and he legitimized the demotic as the medium of communication between the intellectuals and the people.

Biography

Born in Kalamata in 1852, Politis while still a student wrote a study of the manners and customs of the Greek people, comparing the modern with the ancient, entitled *Modern Greek Mythology* (1869). He devoted his life to the establishment of folklore as a discipline. He published collections of *Proverbs* and *Traditions* and a *Selection from the Songs of the Greek People* and edited the journal *Laographia*. He died in Athens in 1921.

Pollution

Pollution is related to the intensive exploitation of natural resources and raw materials to meet the needs mainly of industry, agriculture, and transport. It has occurred on a scale large

enough to cause serious environmental damage only following the industrial and technological revolutions of the 19th century and has today become a matter of major global concern. Incidents of pollution in earlier historical periods are scarce. A rare occurrence was the pollution caused by residues of silver, lead, and iron from the mine of Laurium in southern Attica, which were exploited from the 6th to the 1st century BC, the residues significantly affecting the biodiversity of the locality. Philosophical ideas on nature, resources, and the economic activity of man were, however, fundamental to ancient Greek thought and infiltrated everyday activities. In contrast to the anthropocentric principles of Judaism and Christianity, the gods of ancient Greek mythology were part of nature, bestowing a sacred aspect on its protection. The unity of nature was a paradigm for social behaviour, and moderation, the ruling standard in the ancient Greek world, influenced Greeks' attitude towards the environment as well as to every human pursuit. The irreversibility route of natural processes was emphasized by Heraclitus, and both Xenophon and Aristotle related economic activity and productivity to conservation of natural resources, and conceived of the ethical risk pertinent to overproduction. Such views were reflected in social organization; special rules applied to the cheese and leather industry, to the protection of vegetation from overgrazing by goats, and to the conservation and treatment of water. In Byzantium, although human activities and ideas did not revolve around ancient concepts of moderation and the unity of nature, water was also protected and treated with care, for its connection with hygiene was understood.

Industrial development and the intensification of agricultural production reached modern Greece later than other European countries, and never reached a comparable scale. As a result the effects of pollution are localized and often largely reversible. Variation in topography and climatic conditions and the geographical position of Greece in the Mediterranean basin have led to the development of a multitude of small habitats that are sensitive to pollution. They are extremely important for biodiversity and the protection of rare species, particularly birds and wild flowers. It is estimated that there are between 5000 and 6000 different species of vascular plants in Greece, of which 730 are endemic and more than 100 threatened by extinction. Bird species exceed 400, of which one in four is threatened. Both Greek and EU legal frameworks and guidelines for environmental protection are satisfactory, but implementation, coordination, and monitoring are poor. Adequate protection and monitoring are, however, achieved in 11 natural water reserves that fall under the umbrella of the international Ramsar convention, and the protection of ten forest habitats is assured by their status as national reserves.

Pollution of seawater is a major concern in Greece. The Greek coastline stretches for 16,000 km; it is not only the longest in the EU but one of the longest national coastlines in the world. Some 40 per cent of agricultural activity, 70 per cent of industrial activity, and 90 per cent of tourism are based on the coastal areas, resulting in a conflict of interests and making environmental protection hard to implement. However, seawater quality is generally good and less than 3 per cent of the waters fail to meet bathing quality standards. The greatest cause of organic pollution in coastal waters is the disposal of urban wastewater. Industrial heavy-metal pollution is localized, but data are lacking on local occurrence and levels of various xenobiotics (non-natural synthetic pollutants). Large areas of the Saronic and Thermaic gulfs are heavily polluted by both urban and industrial activities in Athens and Thessalonica respectively. Oil transport through the Aegean and the Ionian seas reaches 100,000,000 tonnes per year of which 10,000–60,000 tonnes are estimated to be disposed of in the sea either by tank cleaning or by naval accidents. This makes the Aegean Sea, together with the northern Adriatic and the Ligurian Sea, one of the three areas most heavily polluted by hydrocarbons in the Mediterranean. Although this does not usually affect coastal areas, the gulf of Pylos in the southern Peloponnese suffered two serious oil transport accidents in the 1980s. A special water-pollution problem for Greece derives from the disposal of olive-mill wastewaters during winter. This occurs particularly in olive-oil-producing areas such as the Peloponnese and the islands of Lesbos and Crete. Although non-toxic in the long term, olive-mill wastewaters may induce eutrophication (an excess of organic substrate overstimulating plant growth and in turn leading to anoxic conditions and death of organisms) in both seawaters and freshwaters.

Use of fertilizers in agriculture has tripled since 1950 but is still lower than in other EU countries. However, occasional occurrences of seawater eutrophication have been attributed to phosphate and nitrate fertilizers; rivers used for farm irrigation, like the Peneus in the plain of Thessaly, have been heavily polluted. The permeability of chalk rock, which is abundant in Greek subsoils and allows for solute leaching, contributes largely to such conditions, so that strict guidelines are needed to protect water from fertilizer and pesticide pollution.

Waste production per capita is among the smallest in the EU, but disposal is poorly organized and planned since only one in three designated disposal areas operates under full official licence. Waste increases dramatically in environmentally sensitive regions preferred by holidaymakers during the summer months; not only is it unsightly but rapid waste decomposition under high temperatures is often also a fire risk and threat to hygiene.

Energy consumption is directly related to pollution, particularly air pollution. Energy consumption per capita in Greece is less than 50 per cent of the mean consumption in the EU, and Greece contributes only by 0.3 per cent to the universal carbon dioxide production responsible for the greenhouse effect. However, energy consumption for transport is rising fast. Air pollution as a result of energy consumption is serious in Athens and its suburbs, where about half the population of Greece lives. The fact that the city is surrounded by mountains, except for the Saronic gulf outlet to the south, prevents the rapid dispersal of air pollutants, which are produced mainly by motor cars (60–70 per cent of smoke, nitrogen oxides, and hydrocarbons, and nearly 100 per cent of carbon monoxide). Measures to reduce traffic jams and improve petrol quality during the 1980s and 1990s have not been particularly successful and under certain weather conditions air pollution levels exceed safety limits. Acid rain, directly related to air pollution in Athens, has affected the marbles of the Acropolis, causing irreversible chemical calcination of their external surfaces. Most of the original pieces, however, have already been transferred to the Acropolis museum, their presence on the Acropolis being replaced by replicas.

Public opinion is very sensitive to the issue of radiation pollution in Greece and, since most regions of the country are vulnerable to earthquakes, no nuclear power plant operates (other than for purely scientific purposes). Technologically outdated nuclear power stations still operate, however, in Bulgaria near the northern Greek border, raising fears of a nuclear accident.

Polybius *c.*200–*c.*118 BC

Historian

Polybius is an invaluable contemporary witness of the rise of Rome in the 3rd and 2nd centuries BC. Where so much is now lost, Polybius' history, at least in part, survives. He was a member of a prominent Megalopolitan family; his father Lycortas held the chief magistracy (*strategia*) of the Achaean League and was a strong advocate of Achaean autonomy in the face of the growing power of Rome. Polybius' own political career was terminated by the Roman victory over Macedon in 168 BC; he was among 1000 Achaeans deported to Italy, not to be released until 150 BC. In Rome he formed a friendship with P. Scipio Aemilianus, which was to bring him into closer contact with the workings of the Roman state and later enabled him to accompany Scipio abroad, for instance on campaign to Carthage.

During this period of enforced leisure in Rome he began his history, an ambitious work in 40 books that took the whole Mediterranean as its subject. After two introductory books the history proper begins with the 140th Olympiad (220–216 BC), the date at which Polybius believed the history of Italy and Libya merged with that of Greece and Asia (1. 3). He was concerned to explain to his fellow Greeks "how and by what sort of government in less than 53 years the Romans came to conquer and rule almost the whole inhabited world" (1. 1. 5, cf. 1. 3. 7–10 for Greek readership). The 53 years ended with the demise of the Macedonian kingdom in 168/67 BC. At some point, however, perhaps after reflecting on the Roman destruction of Carthage and Corinth, he decided to extend his history so that it covered not only Rome's acquisition of power (books 3–29) but also the years that followed, up to 145/44 BC (books 30–39). His purpose was to provide the information that would allow the reader to pass judgement on Roman rule; thus contemporaries could determine whether it should be avoided or welcomed and future generations whether it should be praised or condemned (3. 4). Polybius' own attitude to Rome has been variously interpreted, pro-Roman, anti-Roman, cynical, embittered, impressed; it is perhaps safest to say that he was ambivalent.

The first five books are complete, but the rest exist only in fragments, some quite substantial (in particular the remains of book 6). These are largely the work of Byzantine excerptors, although numerous citations can also be found in Strabo, Athenaeus, and Plutarch, a sign of Polybius' importance for later writers. The "Excerpta Antiqua", which date from no later than the 10th century AD, offer an abridgement of books 1–18, though without book 17. The remaining excerpts survive due to the thematic collections compiled under Constantine VII Porphyrogennetos and reflect the interests of 10th-century Byzantium. They fall under the following headings: *de legationibus* (on embassies), *de sententiis* (on sayings), *de virtutibus et vitiis* (on virtues and vices), *de insidiis* (on plots or ambushes), and *de strategematis* (on military stratagems). Some idea of what is missing can often be obtained from the Roman historian Livy who used Polybius extensively for events in the east in books 31–45 of his own history. None of Polybius' minor works is extant (on tactics, Philopoemen, the Numantine War, and perhaps one on the habitability of the equatorial region).

Polybius had strong views on the writing of history. He frequently breaks off to point out the failings of other historians, attacking the practitioners of sensationalist history (Phylarchus, Timaeus, Zeno of Rhodes) and scorning those who spend their time immersed in the library (Timaeus again, the subject of an extended critique in book 12). He himself stressed the importance of experience and autopsy; only someone with experience of war and politics could write satisfactorily on those subjects. For Polybius the study of history was of practical value, both for the politician and for anyone trying to cope with the vicissitudes of fortune; knowledge of the past helps in the present (1. 1). Polybius' outlook has been described as "utilitarian" and therefore distinct from his Hellenistic contemporaries (Walbank), but recently an attempt

has been made to discern a moralizing tendency in his work (Eckstein).

Book 6 was a digression on the Roman state, with particular emphasis on the constitution and army, both of which he considered fundamental to Roman success and especially to their recovery after the disastrous defeat by Hannibal at Cannae in 216 BC. His analysis of the constitution was very much the work of an outsider, depending heavily on the concepts and categories of Greek political thought. The strength and stability of the constitution, he argued, lay in its combination of kingship (consuls), aristocracy (senate), and democracy (people). However inappropriate this may have been as a model to interpret the Roman constitution, it has had an enormous influence on subsequent western political thought from Cicero to Machiavelli, Montesquieu, and beyond. Its impact in the east is less evident; it was worth excerpting but its theory of the value of divided power was hardly compatible with Byzantine autocracy.

In the Greek world from late antiquity onwards the influence of Polybius appears to have been limited, although he is frequently cited in reference works such as Stephanus' *Ethnica* and the *Suda*. His subject may have appealed, but his style and length deterred. He had long before been damned by Dionysius of Halicarnassus who numbered him among those writers no one reads to the end (*De Compositione Verborum*, 4). Of the historians of late antiquity Zosimus is probably the only one to show any significant awareness of Polybius, but even here the influence is formal and superficial rather than substantial. Echoes of Polybius have been detected in Byzantine historians such as Procopius, Agathias, and Anna Komnene, but nothing is explicit. Byzantine lack of interest is evident in his absence from Photios's *Bibliotheca* and the truncated state of the text.

Polygnotus

Painter of the 5th century BC

Polygnotus was the son and pupil of Aglaophon of Thasos; his brother Aristophon and a younger Aglaophon, probably his son or his nephew, were also painters. Polygnotus, a distinguished artistic figure of the early Classical period, worked in Athens at the time of Cimon, the leader of the Athenian democracy from 472 to 461 BC. In the absence of any surviving fragments of his monumental painting, literary texts – and Pausanias in particular – are the sole source of evidence, giving often lengthy descriptions of Polygnotus' works.

Much of Polygnotus' painting in Athens was in buildings associated with Cimon. According to Pausanias, who lived in the 2nd century AD, the wall paintings that decorated the shrine of the Dioscuri, the Anakeion, located south of the Agora towards the Acropolis, and the Stoa Poikile on the south side of the Agora were attributed to Polygnotus (he was said to have refused a fee for painting the latter). His work in the Stoa or in the Anakeion gained him Athenian citizenship.

These paintings were on view in late antiquity when Pausanias travelled to Athens, but are not preserved today. Polygnotus represented the wedding of Castor and Polydeuces with the daughters of Leucippus in the Anakeion and painted a scene of *Iliou Persis* (Troy Taken) on the interior back wall of the Stoa Poikile. In the latter, he was said to have given to Laodice, Priam's daughter, the features of Cimon's sister Elpinice, who was the artist's mistress, an element implying the idea of individual portraiture in the works of art of the time. The scene was painted on wooden panels secured to the wall, a common practice among painters of murals in Classical Greece.

Pausanias also mentions a set of pictures from the Trojan cycle by Polygnotus in the Pinakotheke (picture gallery) of the Periclean Propylaea. He had painted wooden panels to replace those decorating the Archaic gateway to the Acropolis, which was destroyed by the Persians and later reconstructed under Cimon. Thus, his paintings were earlier than the Periclean building. *Achilles in Skyros* and *Nausicaa* were also in the Pinakotheke. Another painting attributed to Polygnotus was in Rome in Pliny's time, in the 1st century AD, and depicted a man with a shield. This was a fragment of a larger composition,

most probably a wall painting on wooden panels, which had been transported to Rome.

Polygnotus' most famous works, however, were at Delphi, in the Lesche (club-house), which was dedicated to the sanctuary by the people of Cnidus. Although the date of this dedication is unknown, it is usually assumed that the building was put up after the liberation of the city from the Persians, as a result of Cimon's Eurymedon campaign, and that the paintings were executed between 458 and 447 BC. Only the foundations of the building survive, on a terrace near the top of the sloping sanctuary, and it would have been impossible to reconstruct the paintings without Pausanias' description. Two scenes on wooden panels, including some 70 figures (humans and animals), often named, in a scale half lifesize, decorated the interior of the building, which consisted of a rectangular room with a roof supported by wooden pillars set round a central area where athletic exercises took place. One represented the *Iliou Persis* in a more detailed version than that in the Stoa Poikile at Athens, and the second was a depiction of the *Nekyia*, the Underworld. The scenes met in the centre of the north wall and each occupied half of it; it is possible that they extended over the short walls. Besides a detailed description of the composition, Pausanias also refers to the problems with which Polygnotus had to deal and his way of tackling them.

Recent reconstruction has suggested that the *Iliou Persis* and the *Nekyia* formed three self-contained compositions, each spreading over three walls. The former consisted of the sea scene, the altar scene, and the land scene, while the latter included the sacrifice of Odysseus on the north, Achilles and Patroclus in the centre of the western wall, and groups of heroes from both sides of the Trojan War on the south wall. This arrangement of the individual groups was no doubt intentional, so as to enable Polygnotus to focus on the main emphasis of the various subjects in his painting.

He is also said to have worked in Boeotia. He painted *Odysseus after the Slaying of the Suitors* in the temple of Athena Areia at Plataea, the foundations of which are dated after the battle of 479 BC. He also worked at Thespiae, not far from Plataea, where his wall paintings were restored in the 4th century BC by Pausias of Sicyon. One of his paintings portrayed Salmoneus, the king of Elis, with a thunderbolt, a rare subject in the art of the period, which might have been part of a larger scene.

The composition represented an important departure from the established principles of Archaic painting. The figures were not set down on the baseline of the picture, but were scattered on various levels, demonstrating a new concept for the representation of pictorial space, which is associated with the name of Polygnotus. The innovation is reflected in contemporary vase painting, as on the Niobid Painter *krater* (mixing bowl) from Orvieto, now in the Louvre, Paris. Moreover, Polygnotus' compositions were built up from figures in groups of two, three, or more. According to Pausanias, his paintings were characterized by a liking for quiet scenes with little action, often adaptations of earlier action themes to the new ideal of passivity, as in the change from the Sack of Troy into Troy Taken, as well as for the stillness of the figures. Ancient literary sources also attest that Polygnotus had a distinguished ability in the rendering of physiognomy, anatomy, and drapery to reveal the *ethos* (character) and *pathos* (emotion) of his figures. He presented them either before the action – in the process of taking a decision – or in their reaction after it. Another source for Polygnotus' art is Pliny's *Natural History*, compiled in the 1st century AD, which mentions that he painted women wearing transparent drapery and gave them headdresses of various colours, and also showed the mouth open and the teeth visible. Although certain elements of his art had appeared sporadically earlier, their combination by Polygnotus was pioneering.

Pomaks

Bulgarian-speaking minority in Greece

The Pomaks are Bulgarian-speaking Muslims to be found in Greece around Echinos in the Rhodope mountains northeast of Xanthi. In the 1951 Greek census 18,671 Pomaks were recorded, about 500 more than in the corresponding census of 1940. Every other minority in Greece shows a decline during these years. Both figures are likely, however, to be an underestimate. Pomaks are confused about their identity, and could have registered as Greeks, Slavs, or Turks. The census of 1951 was the last to show any interest in any minority apart from the Muslim minority, a blanket term to cover Pomaks, Turks, and Gypsies. A figure of 30,000 Greek Pomaks in 1998 is likely to be an overestimate, since assimilation has proceeded apace since 1951.

In Bulgaria there are about 200,000 Pomaks, equally confused about their identity. In the 1980s, when there was a strong Bulgarian national movement, Pomaks were persuaded to think of themselves as Bulgarians, and changed their Islamic names accordingly. In the 1990s a Turkish political party for a time held the balance of power in the Bulgarian parliament, Islam was supported from abroad, and the Pomaks began

changing their names back again. There are Slav- speaking Muslims in the former Yugoslav republic of Macedonia where they are called Torbeš and in Albania where they are called Poturs. None of these groups has had much contact with any other since World War II. Even the Greek and Bulgarian Pomaks, though both living in the Rhodopes, are not contiguous with each other, the Bulgarian Pomaks living northwest of Xanthi over a border that was very strictly guarded.

The origin of the Pomaks is shrouded in mystery and obscured by political prejudice. The Bulgars assert that they are native Bulgarians lured over to Islam in the early years of the Ottoman occupation. The Turks maintain that they are Turks who somehow learnt the language of their subjects. The Greeks, always anxious to prove the antiquity of a Greek presence in Macedonia and Thrace, suggest that the Pomaks are descendants of some ancient Greek tribe. An alternative theory is that they derive from pre-Ottoman Turks, who had entered the service of the Byzantine empire, and are thus in some sense part of the Greek commonwealth. There is little evidence to support any of these theories; in a curious way the Pomaks with their fair hair and blue eyes seem equally remote from Bulgarians, Turks, and Greeks.

Though the Rhodope mountains were outside the orbit of Classical Greece, their proximity to Constantinople meant that even in the darkest days of the Byzantine empire they were usually under Byzantine control. It is therefore surprising to find this area inhabited by a non-Greek non-Orthodox people. A possible explanation is that the Rhodopes, like Albania and Bosnia, were an area where the Paulician heresy was strong, being indeed the kind of place where heretics could be banished to keep them out of the way. For political and theological reasons such heretics would be ripe for conversion to Islam, particularly when the form of Islam on offer was Bekhtashism, tolerant and mystical. There may also have been less altruistic and more commercial reasons for conversion, in the shape of reduced taxes. Bulgarian speech is easier to explain. A strong Bulgarian empire in the 10th and 13th centuries was not far from the Rhodopes, and even in the 11th and 12th centuries there were many Slav-speakers in the restored Byzantine empire. The Rhodopes are a high mountain range, but not an impenetrable barrier as there are several passes through it. Indeed it looks as if the Pomaks – as cattle and sheep rearers, like the transhumant Vlachs and Sarakatsans – regularly moved across the mountains in search of summer or winter pastures, each preserving their identity through their separate language.

This image of the Pomaks as peaceful pastoralists receives a rude shock with their first definite appearance in history as partly responsible for the Bulgarian atrocities of 1876. It is fairly clear that the irregular Turkish troops or Bashibazouks against whom Gladstone contemptuously inveighed were Pomaks. The peace treaties of 1878 left the the Pomaks under nominal Turkish control, although they seem at the end of the 19th century to have achieved virtual independence. There were further atrocities in 1912. The Balkan War started and the Bulgarians took revenge. Pomak villages still remember this revenge, as Bulgarian villages remember 1876.

In 1913 western Thrace passed to Bulgaria, giving it an outlet to the Aegean. Ethnological maps and statistics of the area show some Greeks in the towns and along the coast, very few Bulgarians, and a large number of Muslims. A different picture would have been shown if language rather than religion had been used as a criterion, since the Pomaks would then have counted as Bulgarian, hard though this would have been in view of the recent massacres. After World War I western Thrace was awarded to Greece, as was eastern Thrace which had a higher proportion of Greek speakers. After the Asia Minor disaster Greece lost eastern Thrace, and there were exchanges of population which dramatically increased the proportion of Greeks in western Thrace. The Pomaks did not, however, take part in these exchanges. Western Thrace was exempted from the exchanges of Muslims and Christians which took place between Greece and Turkey; it would indeed have been difficult for the Slav-speaking Pomaks to have settled in Turkey. Nor did the Pomaks join in the exchanges between Bulgaria and Greece; recent hostilities between Pomaks and Bulgarians would have made this difficult, and the Greeks in Bulgaria lived along the Black Sea coast in an area very differrent from the Rhodope mountains. Thus the Pomaks remain in Greece as an uncomfortable and rather unhappy fragment since neither Bulgarians nor Muslims are exactly popular, the Rhodopes though beautiful are harsh, the border area is a sensitive one, and it requires a special permit to visit it.

Summary

Pomaks are Bulgarian-speaking Muslims who live in the Rhodope mountains of northern Greece. Their origins are obscure. They are probably transhumant pastoralists. They were unaffected by the exchange of populations with Turkey in the 1920s and today probably number fewer than 30,000 in Greece. There are about 200,000 in Bulgaria.

Pontus

The Greek *Pontos* (Latin *Pontus*) has at least seven meanings or connotations, general and specific.

(1) In Greek mythology Pontos personifies the Sea, son of Gaia, the Land, who by Thalassa fathered another ancient sea god, Nereus. Hence (2) the *Euxeinos Pontos*, or Black Sea and,

by extension, the southeastern littoral of that sea, called (3) the Pontus.

How the sea became a land is no mystery. Greeks approached and named the land from the sea. But from the land, on which it turns its back, the Pontus is one of the most strikingly distinct regions of Anatolia. Geography and climate, economy and settlement conspire to make the Pontus as obvious a maritime enclave as the Lebanon is of Syria. The territorial boundaries of the Pontus run for over 500 km from Sinope in the west to the mouth of the Akampsis (Çoruh) river to the east. Often less than 50 km inland this strip is hemmed to the sea by the Pontic Alps. Sinope is the hub of the Black Sea, where the seafaring cult of Poseidon was replaced by that of St Phokas. The Akampsis marks one of the oldest and most stable divisions in the world, traditionally between Europe and Asia, actually between Byzantium and Persia, the Ottoman and Russian empires, and today between Turkey and Georgia. The Pontic Alps rise gently south of Sinope, where they are broken by the Halys (Kizilirmak) and Iris (Yeşilirmak) rivers, which allow access to an Inner Pontus along the Lykos (Kelkit) valley. South of Trebizond (the modern Turkish city of Trabzon) a pass through the Pontic Gates near Zigana at about 2500 m carries the most easterly practicable land route to Persia, until the Pontic Alps reach the Paryadres (Kaçkar Dağ) at almost 4000 m, before falling into the gorges of the Akampsis. The Pontic Alps offer extensive summer pastures for nomads from the interior and transhumants from coastal Pontus, a region streaked by steep, well-wooded, and densely populated valleys, each with its own dialect and tartan, which connect to a chain of Classical Greek colonies along the coast. Here Greeks encountered barbarians, such as Jason found, represented in fable and fact by peoples such as the Amazons to the west and the monstrous Mossynoikoi to the east. Perhaps the most persistent of local identities is that of Chaldia, a basin on the southern side of the Pontic Gates around modern Gümüşhane, which takes its name from the Urartu sun god Haldi. Chaldia was a Byzantine theme (military province) from the 9th century AD and a surviving Orthodox metropolitan bishopric thereafter. To Turks *Halt* indicates people on the other, or "wrong", side of the mountains. The Pontus is surrounded by less well-defined boundaries: Paphlagonia to the west, Cappadocia to the south, and Armenia to the east.

(4) As a political unit a kingdom of the Pontus first emerged in the late 4th century BC, in the aftermath of the conquests of Alexander the Great. Its focus lay inland along the Lykos and Iris valleys, particularly at Comana Pontica (Gömenek), with a great temple economy, and a royal capital at Amaseia (Amasya), where the rock-cut tombs of the Pontic kings overlook a gorge of the Iris. A series of six Pontic kings called Mithridates extended the Pontic state from the 3rd century BC. Pharnaces I moved the capital from Amaseia to Sinope in 183 BC whence Mithridates VI Eupator (120–63 BC) conquered the Crimea and challenged Rome, with disastrous results. Mithridates VI died old and in despair in the Crimea and was buried by Pompey at Sinope. The last Pontic king, Pharnaces II, was defeated at Zela (Zille) by Julius Caesar in 47 BC. These Hellenized kings and their feudal nobility were of Persian origin and ruled a mixed indigenous population, traditonally settled in the *Chiliakomon*, thousands of nucleated villages.

(5) The Roman province of Pontus retained much of this local character and at various stages was subdivided by Diocletian into two provinces: Hellenopontus (Diospontos) based on the city of Amaseia, and Pontus Polemoniacus, also based inland, at Neocaesarea (Niksar) on the Lykos, but with access to Polemonium (Boloman) beside a cape still named after Jason (Yasun). The civil and military division became part of the primary Byzantine theme of Anatolikon. The Roman province is reflected in ecclesiastical dioceses. The evangelist of the Pontus was St Gregory the Wonderworker of Neokaisareia (Neocaesarea) (d. *c.*270), himself converted by Origen, whose life was written by St Gregory of Nyssa. Neokaisareia remained the mother church and metropolis of the Pontus long after the Danishmendids took its great castle and Monastery of the Wonderworker at the end of the 11th century.

(6) With Turkish pressure from the interior, the political focus of the Pontus moved back to the ancient Greek coastal settlements and to Trebizond, capital of the Byzantine theme of Chaldia during the 12th century. The Gabras family, semi-hereditary and semiautonomous dukes of Chaldia, made a political entity of coastal Pontus before it was given political title with the dismemberment of the Byzantine empire, when in 1204 Alexios and David Komnenos aimed to restore the rule of their dynasty in Constantinople, but found themselves pre-empted by members of the Fourth Crusade. Frustrated by another, Laskarid, empire in exile at Nicaea, the Komnenoi settled for the original coastal Pontus, from Sinope to the Akampsis, including high Chaldia, with Trebizond as their capital. The Grand Komnenoi, "emperors and autocrats of all the East [Anatolia], of the Iberians [Georgians], and of the Land Beyond [perhaps the Crimea]", ruled the so-called empire of Trebizond as a Byzantine state, upon which their legitimacy depended, until 1461, when Cardinal Bessarion (*c.*1400–72), perhaps the best-known native of Trebizond, bewailed the loss of this last outpost of Hellenism. Indeed the patronage of such emperors as the Grand Komnenos Alexios III (1349–90) made the Pontus a flourishing part of the late Byzantine world, more populous than the Morea, with a cultural capital to match Mistra. Alexios III endowed Dionysiou on Mount Athos and his own great pilgrim monastery of Soumela. But, like Bessarion, he looked west too. The wealth of Trebizond partly depended on its natural resources and partly on the reopening of the route east through the Pontic Gates to Italian traffic with the Mongol empire from the mid-13th century. But for their security the Grand Komnenoi depended upon the intense local separatism of the Pontus, which the steep valleys engendered along with their own dynasties of warlords, of which the Gabras family were forerunners. The neighbours of the empire were now Turkmen, Mongol and Georgian, with whom the Grand Komnenoi intermarried. They fought their minor wars over summer pastures in the Pontic Alps which divided them. The Ottoman state was not a neighbour until Sultan Mehmet II's conquest of Trebizond (taking the emirate of Sinope on the way) in his summer campaign of 1461, when Bessarion heard of the fate of David, the last Grand Komnenos.

(7) The Ottoman conquest left a Pontic identity alive. From the 18th century local warlords (*derebeys*) controlled the valleys again, but the Pontic Greeks probably found greater economic reward running the revived silver mines of Chaldia

around Gümüšhane (Argyropolis). The mines were exhausted by 1829 when the Russians reached Gümüšhane, but the Treaty of Adrianople reopened the Black Sea to western shipping and subsequent Ottoman reforms brought civil order to the coast. By the 1840s the Pontic Gates were carrying most of Persia's overland trade to the west again through Trebizond. Greek bankers and merchants of Trebizond helped fund an astonishing revival of Pontic Greek culture, but this time schoolmasters from Athens taught villagers that they were descendants of Xenophon's Ten Thousand. Athens, not Constantinople, was the promised city. In fact, since the 1790s many Pontic Greeks found promise in the new cities of southern Russia, such as Odessa and Mariupol, and Pontic Greeks left in the wake of successive Russian invasions to recolonize the Caucasus. The opening of the Suez Canal in 1869 marked the end of the laborious overland route east through the Pontic Gates, but by then the economic focus of the Pontus had already shifted west to Amisos (Samsun), promised railhead of the Berlin–Baghdad railway. Amisos mushroomed as the last major Greek city of the coast, on the scale of Smyrna, where Pontic Greeks cornered the Ottoman tobacco monopoly. The exchange of populations of 1923, when 164, 641 Pontic Greeks left Trebizond alone for Greece seemed to be the final migration. It was not. After an initial honeymoon in the Soviet Union, Pontic Greeks were deported under Stalin in the 1940s, during and after World War II, from the Ukraine, Russia, and Georgia to Central Asia, where in Uzbekistan and Kazakhstan they were joined by Greeks from a very different background – that of the Civil War in Greece. From 1991 the Pontic Greeks (the name by which they refer to themselves) of the former Soviet Union started coming home in what promises to be the last and largest of all Greek migrations: it is potentially a matter of millions. For most, Athens is no more home than Ohio or Melbourne, where many had already settled. *Patrida*, or "home", is still the distinct green land and concept of the Pontus, which few Pontic Greeks have ever seen. Yet, both in Turkish Trabzon and in innumerable Greek colonies in Australia or America, a Pontic identity remains obdurately alive.

Summary

Pontus is the land bordering the *Euxeinos Pontos* (Black Sea), specifically the southeast littoral from Sinope in the west to the modern border with Georgia in the east. The coast was colonized early by Greeks. A kingdom of Pontus emerged in the 4th century BC. The Roman Pontus was subdivided into two provinces. The area was part of the Byzantine theme of Anatolikon, but from 1204 to 1461 formed the independent "empire" of Trebizond. Many Greeks remained during the Tourkokratia who even in the diaspora refer to themselves as Pontic Greeks.

Porphyry AD 234–*c.*305

Philosopher

Porphyry was one of the most influential philosophers and scholars of late antiquity, although from his vast output of more than 70 works only a handful survive. He was probably born in Tyre and bore the Syrian name Malchas. His international career is typical of many Greek-speaking Syrians of this period who made a considerable impact on the whole of the Graeco-Roman world. He was educated in Alexandria, at the Platonic Academy (under Longinus) in Athens, and finally in Rome where he studied under Plotinus. Perhaps his most enduring legacy was the introduction of Plotinus' philosophy to a wider world, achieved both by his careful edition of Plotinus' philosophical treatises under the title *Enneads* and his explanatory commentaries, which are now lost. Among others, Longinus, his former teacher, was grateful to Porphyry for sending him copies of Plotinus' work. A short and probably incomplete work popularly known as the *Sententiae* or *Ideas Leading to the Intelligibles*, which is the only substantial survival of Porphyry's metaphysics and which consists of paraphrases, summaries, and restatements of Plotinus' ideas, may have formed a part of these commentaries or of an introduction to Plotinus.

Porphyry's scholarly commentaries on the logical works of Aristotle and on some of the major Platonic dialogues (*Parmenides*, *Cratylus*, *Phaedo*, *Republic*, *Philebus*, *Sophist*, *Timaeus*) were so valued by his Neoplatonic successors that they were absorbed into their own works. Through Iamblichus, a fellow Syrian who may have studied with Porphyry, these works survive in the great commentaries of Proclus and later Neoplatonists. Porphyry was, in particular, responsible for securing a firm place in the Neoplatonic school curriculum for Aristotle's *Organon*, a virtually canonical set of his logical works. His *Isagoge* became, in both east and west, the standard introduction to Aristotelian logic and is frequently found in manuscripts of Aristotle's logical works. It is through Porphyry, too, that the ideas, and often the actual words, of earlier Aristotelian commentators (e.g. of Aspasius, Herminus, and Alexander of Aphrodisias) were handed on.

His vast learning, which provided an important source for Byzantine scholars, may be discerned in the fragmentary remains of bulky commentaries on Homer and other philological works on Pindar and Thucydides and, not least, in a *Chronology* that was an important source for Christian writers in their attempts to prove the greater, or at least equal, antiquity of the Jewish, compared with the pagan, tradition. But Porphyry fell foul of the Christians with the publication of his treatise *Against the Christians*. The work proved so damaging that it was publicly condemned in a number of imperial edicts and was fated to survive in fragmentary form, ironically, in the works of Christian polemicists seeking to counter its claims (e.g. Eusebius of Caesarea). Although Porphyry attacked a number of Christian doctrines (the divinity of Christ, the resur-

rection of the body), he reserved his chief criticism for the worldly quarrelling of Christ's disciples, especially Peter and Paul, and their distortions of his teaching. Most serious of all, however, was his devastating and scholarly attack on the authority of scripture itself and particularly that of the book of Daniel, which he proved to have been written after the events it was claimed to have prophesied. Porphyry is commonly referred to by Christian writers as the enemy of Christianity and his name was effectively invoked against the Arians who were dubbed Porphyrians, probably because of their subordination of Christ to the Father.

Unlike Plotinus, Porphyry was deeply interested in religion, to which he devoted several large works including a collection of oracles, *Philosophy from Oracles*, in which he apparently explored the philosophical content of oracles mainly from oracular centres in Asia Minor (Didyma and Claros). The attempt to relate philosophy to religion was one of his abiding interests. Realizing that the philosophical road to what he called "salvation" was open only to the few, he sought among the various religions (including Judaism) a common way of salvation open to all men. His failure to find such a way involved him in addressing serious questions about the assumptions of traditional religious practice and in expressing concern about its limited spiritual horizons. His *Letter to Anebo*, a probably fictitious Egyptian priest, raises these issues and was answered by Iamblichus in *On the Mysteries*, a work that can lay claim to being the first systematic attempt to grapple with the philosophy of religion. This work of Iamblichus was to be a momentous point in the reconciliation of pagan religious practice, particularly the salvific rites of theurgy, with philosophy. Iamblichus set the tone for Proclus who in this respect had a profound influence on pseudo-Dionysius and Michael Psellos, who tried to adapt his views to Christian sacramental theology. But, despite his more reserved views about such subjects as the effect of theurgic rites or the presence of the divine in statues, some of Porphyry's pious philosophical tracts survived as popular reading: for example, the *Letter to Marcella*, written to his wife, whom he married late in life, and in which he apologizes for an enforced absence with the explanation that physical separation means nothing to those whose true self is set at the level of "intellect" which is beyond all spatial restrictions; or *On Abstinence*, which advocates vegetarianism and a spiritualized religious practice. The charming essay *On the Cave of the Nymphs*, which presents a number of differing philosophical allegorical interpretations of Homer's depiction of the cave in which Odysseus hid his Phaeacian treasures (*Odyssey*, 13. 102–12), had an enduring influence as a model of Neoplatonic metaphysical allegory despite its unsystematic approach compared with the rigours of Proclus' method.

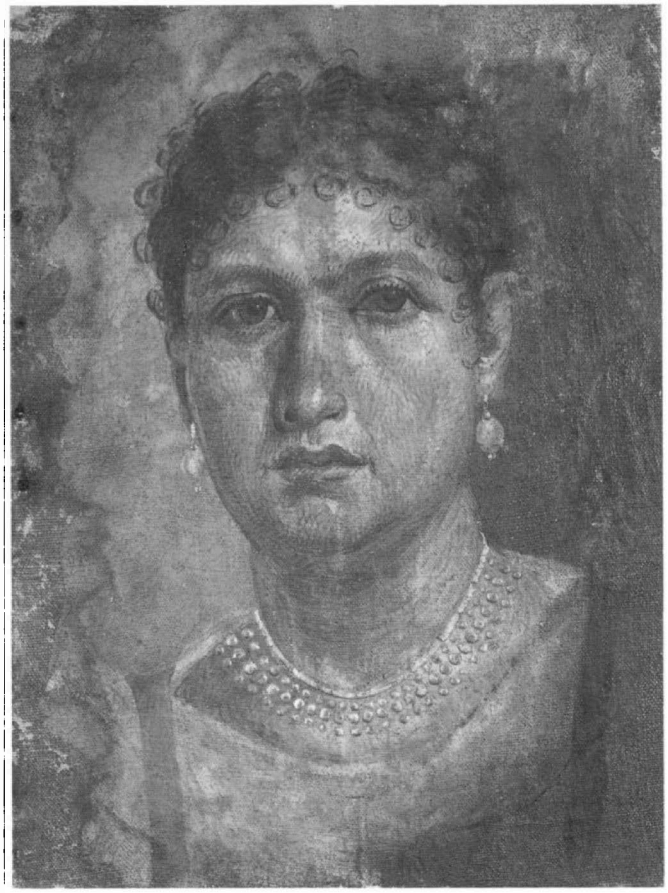
Portraiture

Realistic likenesses of individuals originated in the 4th century BC in Greece, although portrait prototypes had appeared two centuries earlier as dedication statues. An example of this type is the seated figure of *Chares* (British Museum, London), a hereditary priest from the temple of Apollo at Didyma. Similar categories of images from the later Archaic period are commemorations honouring victorious athletes, mainly at Olympia. In the 5th century BC the cult of the hero was prominent, but portrayals of athletes continued. There was a high degree of realism, although the works reflected an idealized picture of youth. Between 480 and 450 BC the practice of honouring the great citizens of Athens with portrait statues became acceptable, although only posthumously. During the Classical period images of military and political leaders, poets, and other heroic men were created so as to reflect their superhuman qualities.

With the end of the Peloponnesian War in the early 4th century BC a novel approach in rendering portraits evolved. Contemporary heroes and intellectuals were now honoured in public locations by private donors. A portrait of the philosopher Plato by the sculptor Silanion (Vatican Museum, Rome) was commissioned by a former student for the Academy in Athens. The sculpture is more of a mask, individual features that reveal nothing of the inner workings of the mind. Towards the middle of the 4th century BC, when the Greeks were encountering rising Macedonian power under Philip II, father of Alexander the Great, Lycurgus, appointed virtual dictator of Athens for 12 years, systematically commissioned a large number of public buildings decorated with portrait statues; he wished to revive the great heroes of the past as examples for modern Athenians to emulate. A large number of portraits were set up at public sites such as the theatre of Dionysus, where bronze statues of the great tragic playwrights Aeschylus, Sophocles, and Euripides were installed. The likenesses of these individuals have an added quality of character and personality that contrasts with the idealized and detached countenances of the 5th-century examples. As full-length statues, their gestures and pose were as important as the features, reminding viewers



Portraiture: mummy portrait of a woman named Aline, Fayum, Egypt, *c.*AD 50, Aegyptisches Museum, Berlin

of their personality, character, and physique. Such statues were frequently inscribed with the subject's name, but rarely with the sculptor's. Portraits of women were rare before this time and restricted to generic statues of maidens, or as female types engaged in everyday activities on vase paintings. An exception to this trend is a portrait of an elderly priestess of Athena by the sculptor Demetrius who specialized in depicting elderly people.

In the last third of the 4th century BC Alexander the Great chose Lysippus as the official sculptor for his court portraits. The heroic ideal of the beardless young general became a standard mode of representation for the Macedonian king. The famous mosaic of *Alexander the Great and Darius* at the Battle of Issus (Museo Archeologico Nazionale, Naples) is a Roman copy of a Hellenistic painting probably painted in Egypt, perhaps by Helen, who trained under her father Philoxenos, in the 4th century BC. It is also known that Alexander commissioned the great painter Apelles and the gem engraver Pyrogoteles to portray him, in addition to the sculpted likenesses by Lysippus. Despite literary descriptions of the beautiful young general, no great images remain for posterity.

Subsequent Hellenistic rulers emulated this portrait type but eventually added their own distinctive style and individual characteristics to the mass-produced likenesses. The most significant change in the portrait tradition reflected the philosophical changes that had taken place. Aristotle, teacher of Alexander, identified men according to personality rather than classifying them according to their occupation, the practice of the 5th century BC. In sculptural portraits, therefore, there was a marked change from emphasizing external features to showing the characteristics that mirrored the psyche of the individual and reflected his or her inner life. Changing attitudes towards the physical and spiritual world are identified in the portrait of *Aristotle* commissioned by Alexander. The new biographical portrait encompassed the entire life of the individual and, as such, became a milestone in the development of the history of portraiture and art in the western world.

The portraits of Alexander's successors are more individualized, with the three major kingdoms in Egypt, Syria, and Asia Minor assimilating distinctive artistic traditions. General categories of portraits still persisted, that of the ruler and the intellectual. A desire to portray strong emotions resulted in a new emphasis in portrait-making that emphasized a kind of hyperrealism in depicting anti-heroic types. Drunken old women, defeated boxers, dancing dwarves, emaciated men, and languid lovers all promoted art and its spread, not only in public places of gathering, but at a popular level. Because of the vast numbers of portraits produced, there is ample evidence for multiculturalism and diversity in the ancient Greek world, shedding light on ordinary people as well as the aristocracy. With the Roman conquest of Greece, the changing tradition of creating and commissioning portraits of private citizens as well as public heroes was an important artistic and philosophical legacy passed on to Rome by the Greeks. Unfortunately, surviving painted portraits and likenesses created in mosaic are rare in the Greek world. As a result of the eruption of Mount Vesuvius in AD 79, however, several personalities have been brought to light by archaeological discoveries at Pompeii, Herculaneum, and Stabiae. A 25 ¥ 20 cm mosaic of an unidentified Pompeiian woman of the 1st century BC (Museo Nazionale, Naples) reflects the psychological portrait type popular in the Hellenistic era. Her likeness is formed with very small pieces of coloured stone, called tesserae, in a manner that mimics the subtle shading of the facial features. Likewise, the double portrait of a man and his wife (Museo Nazionale, Naples), discovered next door to a bakery in Pompeii, is painted with the cultural symbols of the middle class. He is holding a scroll and his wife, in her red-dyed robe, holds a wax tablet and stylus, perhaps for the accounts. For the merchant classes, it was important to show one's occupation and status in addition to a rather naturalistically rendered likeness.

In Egypt the painters of the Fayum were either Greek residents dating from the Ptolemaic period of the late 4th century BC, or those who had inherited the Greek artistic tradition. The art school established at Alexandria was an extension of Graeco-Macedonian art, a tradition that melded with the Egyptian manner of creating body doubles to which the spirit of the deceased could return. Culture was much the same under the Romans as it had been under the Hellenistic rulers, with the chain of artistic knowledge remaining unbroken for many years. The Fayum portraits bridged the gap between Hellenistic portraits and the abstract likenesses of Byzantine icons.

The wax portraits completed during the life of the individual and displayed in the home belonged to the traditions of Greek art. After death, the portrait panel was placed over the Egyptian mummy's face. Gold wreaths, jewellery, and hair

ornaments were painted on, contrasting with the impressionistic quality of the portrait. What is unique about the Fayum portraits is the way in which the personality is reflected through the faces of men and women in a psychologically compelling way. The Christian emphasis on the spirit with the body as a vehicle for the soul found a parallel in the Fayum portraits, particularly the eyes, which convey spirituality; they were the ideal stepping stone for the transition from painted portrait to icon. Portraits underwent a series of transformations from idealized image to the abstracted faces of Byzantine emperors and members of their court, which were represented in paintings, mosaics, coins, and jewellery.

By the end of the 3rd century AD true realism gave way to greater expressiveness, sometimes with an almost caricature-like effect. Yet the eyes maintained their dominant emphasis and spiritual character in the sacrifice of physical beauty in order to convey the beauty of the soul. The kind of artistic symbolism apparent in these and subsequent portraits persisted for a millennium. Sixth-century mosaic portraits in San Vitale, Ravenna, of the emperor Justinian and his wife Theodora reflect the pomp and ceremony of the court. The tesserae are larger in size, making the images bolder, brighter, and heavily resplendent with the trappings of their office as Christian rulers. Even coin portraits revealed the shift to abstraction, with bejewelled empresses and emperors in the regalia of Christian monarchs. The new frontality and enlarged eyes that had once been the realm of lower-class portraiture in the early empire were adopted by the Church and state as proper vehicles of expression in a new world of spirituality, ceremony, and status. Image was everything, naturalism secondary.

This new world order made a ready transition in portraiture to Byzantine icons and has been maintained to this day, in the icons of Virgin and Child, saints, and other holy figures prevalent in monasteries, churches, and homes. The custom of preserving the image of the deceased persists but in the more naturalistic manner of the Classical age. While modern technology has allowed for photographic likenesses, other grave memorials with relief carvings or portrait statues maintain the sculptural tradition of the past. One has only to visit the cemeteries and churches to glimpse the art of the portrait still celebrated in Greece.

Posidonius *c.*135 BC–*c.*51 BC

Philosopher and scientist

To call Posidonius a "historian" would be unduly reductive. Posidonius was a Stoic philosopher and a scientist, with a wide world-view that integrated cosmic, natural, and human phenomena. More than 400 testimonia and fragments testify to his contribution to knowledge, which ranges from mathematics, astronomy, and geology, to ethics, anthropology, and history. He meditated on the universe, seen by him as an animated organism, and on its generation and destruction. He studied the solar system, envisaged a lunar theory to explain the periodicity of tides and a new method of measuring the circumference of the earth, suggested "ethnic criteria" for naming the earth zones, and outlined a history of the circumnavigation of Africa. In human sciences his curiosity was stimulated mainly by customs, an essential element of what he called "ethology" (fragment 176 in the Edelstein-Kidd edition, E-K), i.e. character formation and characterization of people. He might be defined as a "primitivist" who idealizes the primeval stages of mankind as a golden age; but he was convinced that the ascent of man from barbarism to civilization was determined ultimately by "wise men" – legislators, inventors, imitators, or importers of foreign arts and techniques (testimonium 6; fragments 265–67 in the Jacoby edition; fr. 284 E-K) – as if there was an element of "progress" in his thought. Undoubtedly, he admired the presumed simplicity of "noble savages" and had no praise for the luxury and extravagances prevailing in his time either in decadent cities and royal courts (especially in the east: e.g. frr. 56, 58, 61a, 65, 77 E-K) or among the ruling elites of tribal societies (frr. 67, 152 in the Theiler edition, D-F). He eulogized the presumed virtues, frugality, justice, and religious devotion of the ancient Romans (frr. 256–61 and 265–67 E-K, with the exempla of Brutus, Marcellus, and Scipio), as against the current intemperance and corruption. Following Polybius, he probably looked at the crucial year of 146 BC as the completion of Roman imperialism and the beginning of its moral decline. Like Polybius, he was a Greek thinker who tried to explain the merits of Roman rule to his fellow countrymen and to persuade them to accept it, at the same time doing his best to persuade the Roman ruling class to behave in a way that was attractive to most of the subject peoples. He fully justified imperial rule, even the exaction of tribute by more intelligent nations, in return for protection and security for the weak, on the model of the relationship between the Pontic Heracleotes and the Mariandynians, who were allegedly reduced to serfdom by consent (fr. 60 E-K). He believed that riches spur men to do evil, and was ready even to acknowledge that tyrannical rule may provoke rebellions; yet he never justified revolts and described vividly the immoral and extravagant behaviour of rebel leaders (e.g. Athenion, tyrant of Athens: fr. 253 E-K; Demophilus, the leader of the rebel slaves in Sicily: fr. 59 E-K). In the light of such views it is not easy to decide whether

Posidonius sided with the Roman Optimates or with the Populares. His romantic view of the past invites comparison with the Gracchan tradition, but unlike it, his conservatism was definitely anti-revolutionary (fr. 51 E-K; cf. Jacoby, frr. 87, 110–12).

Posidonius' direct predecessors were Panaetius and Polybius, the first as his Stoic teacher, the second as chosen universal historian to continue his work. Yet Posidonius was not dogmatic, and continuation did not imply identification with the views and methods of his predecessor. He criticized Chrysippus (fr. 34 E-K), the grand master of 3rd-century Stoicism, and attacked Polybius for his biased report of Tiberius Gracchus' activities in Spain (fr. 271 E-K). In sciences and philosophy he used Plato extensively, and Aristotle, and occasionally many others, for example, the "astrologer" Bion (a disciple of Democritus), the philosopher Crates, the historian Callisthenes, the peripatetic statesman Demetrius of Phaleron, and the geographer Timosthenes. In ethnography Posidonius was comparative and moralistic in spirit. He valued autopsy no less than Herodotus, whom he mentions together with Heraclides Ponticus on the circumnavigation of Africa, and shared with him the main didactic purpose of pointing out the contrast between *Naturvölker* and civilization. An oriental Greek like Herodotus, Posidonius was no less inclined to ascribe to ancient eastern sages discoveries conventionally attributed to later Greek scientists – for example, the atomic theory, invented according to Posidonius not by Democritus of Abdera but by the Phoenician Mochos of Sidon before the Trojan War (fr. 286 E-K). In his repetitive descriptions of luxury banquets and receptions, drinking habits, etc., Posidonius echoes the Hellenistic motif of trust, best represented before him by Phylarchus of Athens and Agatharcides of Cnidus. He also probably used Ephorus, Polybius' main predecessor in universal history, and Timaeus; and he knew of Eudoxus of Cnidus' observation of Canopus when making his own (fr. 204 E-K). Finally, Artemidorus of Ephesus, who travelled in Gaul and Spain around 100 BC, was known to Posidonius, who occasionally disagreed with him (Jacoby, frr. 119, 223).

Posidonius was unquestionably the greatest Stoic philosopher of his age. Among his closest friends and admirers were some prominent Romans, such as Rutilius Rufus, Cicero, and Pompey, and his prestige in Latin literature is well attested (e.g. in Vitruvius, Seneca, Pliny, Quintilian, Tertullian, Lactantius, St Augustine, Macrobius, and Boethius). The Hellenic tradition starts with his disciple Jason, who succeeded him at Rhodes, and with Diodorus Siculus, who used Posidonius (with other sources) on the period covered by his *Events after Polybius* (146–*c.*86 BC). Posidonius' influence as an intellectual must have been extensive in his generation, but he soon began to be consulted, quoted, and at times criticized by scientists and philosophers mainly for specific points of their interest. Thus, for instance, his disciple Geminus, an astronomer, compiled an "epitome" of, or a commentary on, his *Meteorologica* (t 42, 72 E-K), and the philosopher Arius Didymus included in his doxography Posidonius' definitions of cause, substance, and matter, origin, destruction, and so on. Strabo, a great admirer of Posidonius, made full use of his geographic works, though criticizing his "aetiology" ("precisely what our school [i.e. the Stoic] avoids") and his rhetorical style (fr. 239 E-K).

Plutarch quotes Posidonius both on scientific and moral issues in the *Moralia* (and in his *Lives* of great Romans (Marcellus, Fabius Maximus, Marius, Cicero, Pompey, and Brutus). Galen used Posidonius extensively but critically, especially on ethics; Athenaeus, our main authority on Posidonius' historical works, aptly understands the relationship between his ethnography and his Stoicism; and Diogenes Laertius quotes his views on many topics, especially in book 7 (on the Stoics). Among later readers the most prominent is perhaps Cleomedes (now dated to the 4th century AD), who was interested in astronomy and physics. The *Suda* has an entry on Posidonius, and in the 12th century Eustathios made full use of his scientific and ethnological work in his commentaries on Homer and Dionysius Periegetes.

Surprisingly enough for a man of such reputation, with nearly 70 recorders, none of Posidonius' 30 or so works has reached us in its entirety. But perhaps modern evaluations of his achievements have been too high. The claims that in the history of ancient thought Posidonius can be compared to no one but Aristotle, or that he was the most important critic and philosopher of culture in the ancient world, are patent and unwarranted exaggerations, partly resting on questionable reconstructions of Posidonius' thought allegedly retrievable from later authors supposed to be his followers or even his plagiarists. At any rate, in the Hellenic tradition of Roman and Byzantine times Posidonius' place seems assured among the great thinkers of second rank – still a very high station.

Biography

Born at Apamea in Syria *c.*135 BC, Posidonius was educated in Athens under Panaetius but lived mostly in Rhodes. He participated in an embassy to Rome in 87/86 BC and travelled extensively in the west. His school in Rhodes was a centre for Stoicism. He wrote on a wide range of subjects including science, mathematics, geography, and history as well as philosophy. He died *c.*51 BC.

Pottery

The introduction of pottery vessels is one of the defining features of the Neolithic period (*c.*7000 BC). Although at this time it was handmade, some Greek Neolithic pottery reached high standards of fabric, form, and decoration, the last mostly in geometric patterns. The products of the Neolithic cultures of Thessaly (Sesklo, Dimini) are particular noteworthy.

There was only limited continuity of features into the Early Bronze Age (*c.*3500 BC), when quite different types appeared and some early influence was exerted by Anatolian forms. The most interesting innovations are found in Crete (Vasiliki "teapots", the mottled colouring produced by manipulating the firing process) and the Cyclades (incised "frying pans" with representational motifs; painted patterns).

The Middle Bronze Age saw the rise of the Cretan palaces (*c.*2000 BC), the first widespread use of the wheel for pottery-making, and highly sophisticated ceramics. Some Cretan wares were extremely fine ("eggshell") and motifs, in the "light-on-dark" technique characteristic of the time, were subtly accommodated to the shapes. Potters on the mainland had some distinctive fabrics (Minyan, Matt-painted ware) but less decorative imagination, while Cycladic craftsmen derived their inspiration from Crete, at the same time showing individual enterprise in the development of shapes (panelled cup) and motifs (goblins).

The Late Bronze Age (*c.*1600 BC) was dominated, both politically and culturally, first by the later Cretan palaces, then by the Mycenaeans of the Greek mainland. In Crete a new system of decoration ("dark-on-light") succeeded, and was used at first for a combination of geometric motifs (spirals) and floral and grass designs, then also for a highly distinctive "marine" style. The Mycenaeans inherited all these features but imbued the pottery and other products of their material culture with distinctive stylistic and thematic features. In particular they simplified and stylized the decorative elements, which in Crete had been relatively naturalistic, to a high degree. Some shapes are also distinctive of their taste (*kylikes*, or high-stemmed goblets; deep bowls). A "pictorial style", the motifs of which are mainly birds, animals, and warriors in chariots, was less widespread. In the last phase of the Bronze Age (12th and early 11th centuries BC) a pictorial strain continued (including the new "Octopus style" of the Aegean) but pottery subsided into a more limited range of shapes with little or no decoration. In the sub-Mycenaean phase (mid-11th century BC) the pottery produced was poor in quality and restricted in variety.

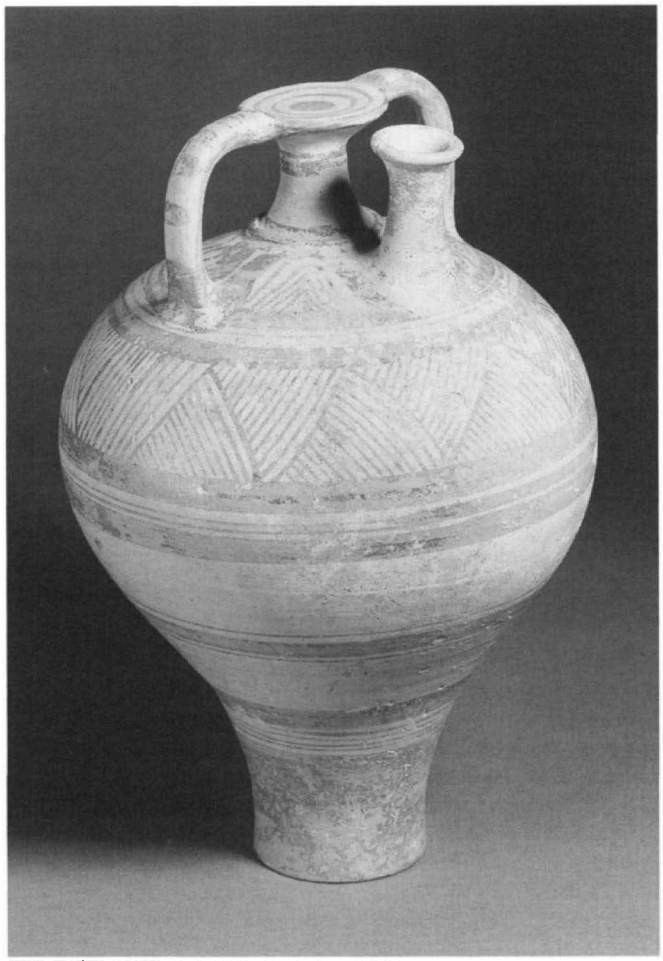
Although little Cretan pottery was exported beyond the Aegean in the Palace periods, within that area it was strongly influential. Mycenaean products reached a much wider audience – Cyprus (for which market much of the pictorial style was manufactured), the Near East, Egypt, southern Italy, and Sardinia. Philistine pottery of a late phase of the Bronze Age is derived from Mycenaean.

During the Protogeometric period (*c.*1025–900 BC) there was a great revival of quality, if not range, with new taut shapes and precise, often compass-drawn motifs, and craftsmen showed a fine sensitivity for the harmonizing the two. This characteristic quality continued to prevail in the subsequent Geometric period, when zones of decoration tended to multiply until they covered the whole surface of the vase. Schematic figures, geometric in character, also appeared, and some of the scenes in which they were shown may be the earliest pictorial versions of Greek myths. The largest vases (*c.*1.5 m high) were used as grave markers, and mourning and funerary scenes are common.

The Geometric style lasted to *c.*725 BC and beyond, but, in its later stages, enlargement of and greater concentration on the figured scenes brought a decline in the relationship of decoration to shape. This trend was partly due to the increasing interest of Greek vase painters in the arts of the east Mediterranean, where a fuller and non-geometric treatment of the human form was current (although not in pottery decoration). "Orientalizing" features (*c.*725–625 BC) are most evident in the adoption and treatment of bird and animal motifs.

Corinth was the most innovative centre at the time, and a new technique was introduced there *c.*700 BC. This was the so-called "black figure" method, which involved painting the figures in a clay slip (the black colour was achieved by the firing process) on the vase surface and incising details of anatomy, drapery, etc. with a sharp point; other colours were sometimes added. The precision of this method suited the fine detail required for the decoration of the tiny perfume flasks (*aryballoi*) which were the staple of the Corinthian industry.

The Athenians, with a preference for larger vases, initially drew their figures in outline, painting in the detail, but around 625 they too adopted the black-figure technique and used it increasingly for large-scale mythological scenes. Their pottery rapidly superseded that of Corinth in popularity. The stately magnificence of the work of the best Athenian black-figure painters (such as Execias and the Amasis Painter) of the mid-6th century BC is astonishing. Interest continued to be focused on the figured scenes (see below), although the elegance and symmetry of the shapes and the surface finish were also of excellent quality. Black-figure pottery was widely exported,



Pottery: stirrup jar from Knossos, 2nd millennium BC, Ashmolean Museum, Oxford

especially to the Greek colonies, and regional styles developed, in the case of the Etruscans even outside the Greek-speaking world.

Around 530 BC another new technique ("red-figure") was introduced and gradually became dominant. The vase surface itself was now covered with paint, the figures being left "reserved" to take on the natural colour of the clay when fired. Interior details were painted. The more natural body colour, and the greater fluidity that the painted line gave to dress and anatomy, allowed artists to depict more complex scenes in a more naturalistic way, but the otherworldly quality of black-figure was lost. During this period the art of wall painting was becoming prominent in Greece and there is good reason for thinking that vase painters adopted on occasion certain features (variable ground lines, landscape and background elements) that were better suited to the broad sweep of large panel pictures than to vase decoration.

Although there is no convincing explanation why pottery decorated with figured scenes in the red-figure technique ceased to be produced much after *c.*300 BC, it may be that the aesthetic effect had become much less satisfying, now that the importance of the relationship between shape and decoration had been forgotten in the quest for exciting narrative and spectacular effects, and borrowings from the world of free painting had proved counterproductive. Red figures were also less appropriate for vase decoration than black since, while the latter stay visually on the surface of the vessel and emphasize its volume and structure, the former seem to recede into the shape and deny its solidity.

From the time when the Greeks started to establish colonies and trading centres overseas (as early as the 8th century BC, but more intensively from the later 7th century BC), especially in south Italy and Sicily but also in other areas (the north Aegean, the Black Sea, Asia Minor), their pottery became more widely distributed, more influential on other cultures, and, in theory at least, more open to modification by the adoption of foreign ideas. In fact the influence of Greek pottery on that of other traditions was strictly limited (Etruscan vases are a marked exception) and the Greeks, whether at home or abroad, seem to have adopted little directly (the rhyton shape is one example) apart from a few superficial features, although exotic stylistic features were transformed into local idioms in the Orientalizing period. In particular, the black- and red-figure styles that are so admired today had no further influence until the Neoclassical movement of the 18th century (see below).

Although the red-figure style lasted longer (till the early 3rd century BC) in the Greek colonies of south Italy, in the Hellenistic period it was superseded by other forms of decoration. Painted figured scenes were less prominent, but minor decorative elements were applied in this way (West Slope ware). Figures were now depicted in relief on vases made in moulds (Megarian bowls). The tradition of relief decoration continued in the most widely known varieties of Roman figured pottery (Arretine and Terra Sigillata, the latter sometimes known as "Samian", although it has no significant connection with the island of Samos). Many Roman shapes were also inherited from the Hellenistic world.

Greece, as part of the Roman empire, succumbed to Roman forms in the field of pottery and, if the Hellenistic influences are discounted, the products of this period are Greek only in the sense that they were manufactured in the Aegean, where some local variants of more widespread types naturally appeared. Only relatively recently has serious scholarly attention begun to be focused on pottery of the late Roman and subsequent periods. The first synthetic work on Greek pottery after 1700 (with discussion of the late Roman and Byzantine background), an excellent study by K. Korre-Zografou, appeared in 1995. Treatment of these phases here is therefore more summary.

Byzantine pottery, which was based initially on late-Roman forms but later developed highly distinctive features with new decorative techniques (glaze from the 7th century, and sgrafitto, or incised designs), was the pottery not only of Greece in its ancient or modern territorial sense, but of the Byzantine world as a whole. Much of it was made in Constantinople and exported. During the post-Byzantine period, after the fall of Constantinople in 1453 and the spread of the Ottoman empire, there was at first little change in the pottery produced in the Greek world, though eventually there was a coarsening of style and an increase in local rather than centralized production. But Greek traders were involved in wide international contacts that resulted *inter alia* in the arrival, increasing popularity, and imitation of foreign wares in the Aegean. These came from both east and west.

Islamic influence was first passed into Greece through the products of the Asia Minor centre of Iznik (Nicaea), active *c.*1490–*c.*1700. The so-called Rhodian plates and other forms, whose attractive and colourful designs included flowers, human and animal figures, and ships, were widely distributed in the Aegean and further afield in the 16th and 17th centuries. In spite of the name these are now known to have been produced at Iznik but were mostly distributed through the island of Rhodes. In the 19th century and at the beginning of the 20th century products of the Koutalhaya potteries (established 17th century) were also distributed in Greece, and another important centre was Çannakale (18th and 19th centuries, surviving until 1922).

From the other direction, westerners (Venetians, Genoese, crusader Franks, etc.) had been involved in the Aegean from at least the 11th century, and more intensively after the establishment of the Latin empire at Constantinople in 1204. Some Greek merchants were resident in Italy (especially from the 16th century). There are occasional signs of the influences of knightly taste (falconry, armed combat) in the figured decoration of late-Byzantine pottery. Italian majolica was extensively imported and imitated from the 16th century; protomajolica is found in Greece in the 13th century.

In shapes, colours, and decorative techniques the late-Byzantine tradition remained strong, particularly in northern Greece (Epirus, Macedonia, Thrace) where the characteristic colouring and sgrafitto decoration are found into the 20th century. In the 19th century many regions and places in Greece developed their own distinctive products and styles and there was a good deal of exchange. Island potteries were particularly active (Samos, Siphnos). The spread of ideas and techniques was facilitated by travelling potters, especially those from the island of Siphnos. At the same time foreign products were popular and some types were specially ordered from abroad (Syros commemorative plates from Britain; others from France and Italy) for the Greek market. Many of the products (e.g. storage pithoi) of these potteries fulfilled purely practical functions, but fine wares were increasingly demanded for the table and for interior decoration, a special stimulus being given by the emergent bourgeois society that developed after the establishment of the kingdom of Greece in 1833. Ceramic decoration (especially antefixes) in a Neoclassical style was also popular for buildings of the 19th and earlier 20th centuries. After the exchange of populations in 1923, refugee potters from Asia Minor set themselves up in Greece, establishing workshops and factories and introducing new ceramic features. Although a few local potteries survive and some of the larger factories (e.g. Kerameikos in Athens) continue to turn out fine pottery, some of which reflects earlier traditions, most regional production has been superseded in recent years by featureless mass-produced or imported products.

Greek pottery, especially that of antiquity, has contributed to the spread and understanding of the Greek tradition in various ways. Perhaps the most striking example of its influence on a foreign ceramic tradition is a somewhat anachronistic one. From the late 18th century the British Wedgwood potteries made extensive use of shapes, decorative motifs, and figured styles directly derived from ancient black- and red-figured and mouldmade pottery. Apart, however, from one or two attempts to imitate black- and red-figure effects using modern techniques (the ancient methods were not then understood), the materials and techniques were different, even though the connections in style and subject are very marked. This trend of course was part of a much wider Neoclassical movement.

As regards the scholarly investigation of ancient Greece, pottery of the black- and red-figure styles has played a major role in the study of Greek mythology and everyday life as well as in disseminating knowledge, since it is by far the most abundant, as well as an exceptionally attractive, pictorial source. The vast amount of material available and the equally vast amount of academic effort devoted to ancient pottery have resulted in a detailed understanding of types and phases of development and of the precise origins of many classes and features. Invaluable for establishing both relative chronology and interconnections between different centres in antiquity, such material is fundamental to historical reconstruction. Recent research has greatly extended its usefulness in this way in the Byzantine and later periods.

In more general terms, ancient Greek pottery has come to be regarded, if often implicitly, as providing classic examples of ceramic quality and style. In fact, however, interest in its archaeological and thematic value has almost entirely overshadowed discussion of its merit as an integrated art form. Here, there are good grounds for arguing that the Geometric was the most successful period and that, however subtle and skilful the figured scenes depicted in the black- and red-figure styles, the very impact of these and their neglect of the structure of the vessel distorted that balance between decoration and shape that is essential to make a vase a work of art.

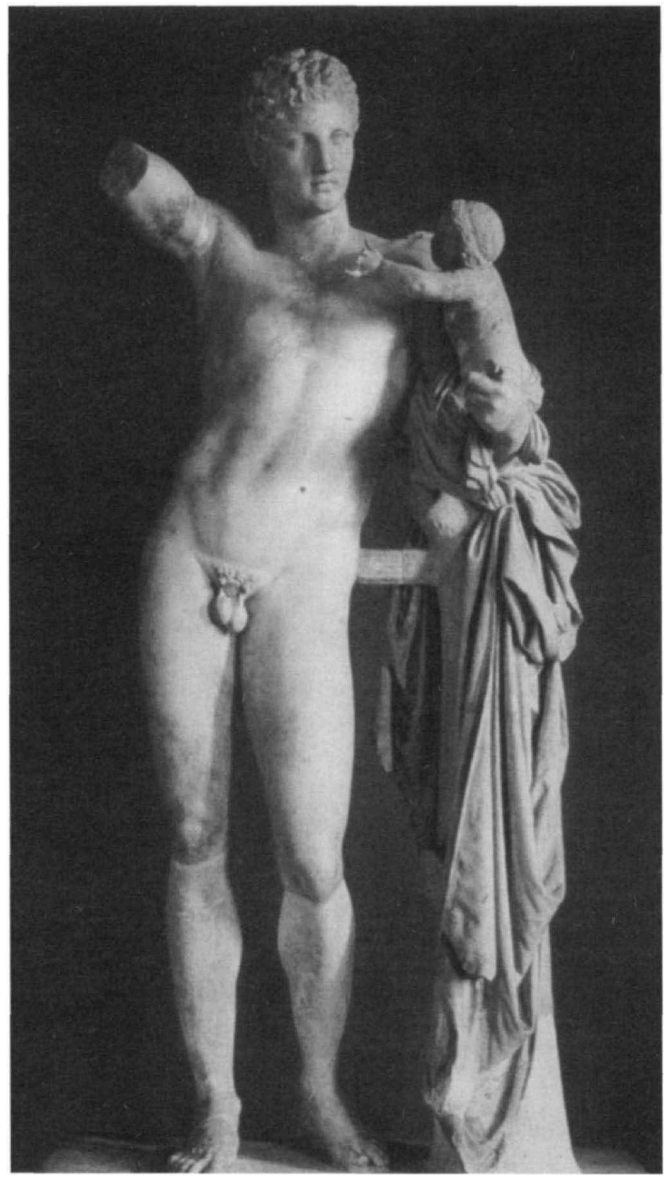
Praxiteles

Sculptor of the 4th century BC

Praxiteles was an Athenian sculptor active in the 4th century BC; Pliny (*Naturalis Historia*, 34. 50) places him in the 104th Olympiad (364–361 BC). It is likely that he came from a family of sculptors; his father was probably Cephisodotus, who created a famous statue of *Peace* (perhaps dedicated after 374 BC when Athens came to terms with Sparta). Praxiteles is likely to have been born around 400 BC and had probably died before 326 BC, when his son is known to have been responsible for naval liturgies at Athens. He was celebrated in antiquity, along with Lysippus, for achieving "realism" (Quintilian, *Institutio Oratoria*, 12. 10. 1–10).

Praxiteles made statues in both bronze and marble, and was, according to Pliny (*Naturalis Historia*, 34. 69), "more successful" in the latter medium. Marble was the medium used for his most celebrated statue, the *Cnidian Aphrodite*, which in Pliny's day attracted people to the city of Cnidus (*Naturalis Historia*, 36. 20). Praxiteles had apparently been commissioned by the people of Cos to make a statue of Aphrodite, and he created two, one draped, and the other naked. The people of Cos rejected the former, while the naked statue was acquired by Cnidus and displayed in a circular temple so that the goddess could be viewed from all sides. One of the best descriptions was made by Lucian of Samosata (*Amores*, 13–14) in the 2nd century AD, who described it as "an exceedingly beautiful work of Parian marble". The original is likely to have had parts that were gilded or painted to enhance the work. There was a tradition that Praxiteles used his mistress, Phryne, as the model for the statue. Roman copies of a naked Aphrodite, clearly just concluding a wash, are thought to be representations of this work. The original was carried off to Constantinople where, according to the Byzantine chronicler George Kedrenos, it was displayed in the basilica of Lausus – along with many other statues of the ancient world including the chryselephantine cult statue of *Zeus* from Olympia – until its destruction in a fire in AD 476.

Praxiteles also made a comparable *Aphrodite* in bronze. This was carried off to Rome and was subsequently destroyed in a fire that consumed the temple of Felicitas where it was displayed. Praxiteles' continuing popularity in the Roman period is reflected by the way that his works were carried off to Rome. These were displayed in the gardens of Servilius, on the Capitoline, and in the collection of Asinius Pollio. Praxiteles' fame led him to be associated with the creation of the Mausoleum of Halicarnassus, one of the wonders of the ancient world.



Praxiteles: statue of Hermes attributed to Praxiteles, Olympia Museum

Phryne was celebrated in a gold statue made by Praxiteles at Delphi (Athenaeus, 13. 591b). Phryne herself came from Thespiae in Boeotia, and it was there that Praxiteles made a marble statue of *Eros*; Strabo records the tradition that Praxiteles had given it to his mistress as a gift. This statue was removed by the Roman emperor Caligula, returned by Claudius, and then snatched by Nero; in Pliny's day it was displayed in the lecture rooms of Octavia in Rome. Pausanias, writing in the 2nd century AD (9. 27. 3–5), recorded that, although the original had been destroyed by fire in AD 80, a copy of Praxiteles' work made by Menodorus of Athens could still be seen at Thespiae.

At Olympia Pausanias (5. 17. 3) saw a marble *Hermes* carrying the infant Dionysus in the temple of Hera that was attributed to Praxiteles. A *Hermes* was in fact discovered in the temple in 1877 and was accepted as Praxiteles' original until questioned in 1927. Although there is a possibility that it is an original that was touched up by later sculptors, scholars now

tend towards the view that the Olympia piece – perhaps the one seen by Pausanias – is in fact a work of the Hellenistic period, either by a member of Praxiteles' school or by somebody working in his style.

Pausanias (8. 9. 1) also recorded statues of *Apollo*, *Leto*, and *Artemis* in the temple of Leto at Mantinea. Although these statues have not survived, the base showing the *Muses* and *Marsyas*, mentioned by Pausanias, is preserved. These statues were dated to "the third generation after Alcamenes" who was active, according to Pliny (*Naturalis Historia*, 34. 49), in the 83rd Olympiad (448–445 BC).

Another of Praxiteles' works known from later Roman copies as well as representations on Roman coins is the *Apollo Sauroctonus* ("Lizard Killer"). This statue was described by Pliny as showing a young Apollo waiting to kill a lizard with an arrow. Altogether almost 70 works have been associated with Praxiteles, though some may be the works of members of his school or workshop.

Praxiteles' sons Cephisodotus (probably named after his grandfather) and Timarchus were also sculptors. Pliny (*Naturalis Historia*, 34. 51) places their activity in the 121st Olympiad (296–293 BC), although an inscription from a statue base shows Cephisodotus II was active in the year 344/43 BC (because it names the priest of Asclepius for that year). Further generations of sculptors can be traced into the Roman period.

Summary

Born probably *c.*400 BC Praxiteles was the son of Cephisodotus of Athens, himself a sculptor, and was active *c.*375–330 BC. He worked in bronze and marble and specialized in portraits, notably of gods. No surviving statues can be attributed with certainty to him, though several are ascribed to his school. His sons Cephisodotus and Timarchus were also sculptors. He died *c.*326 BC.

Prehistory

Prehistory is the term used to describe societies which did not have written records. In Greek archaeology the term is sometimes used to include the Bronze Age, but more frequently (as here) it refers to the three periods of the Stone Age: Palaeolithic, Mesolithic, and Neolithic.

Because of its geographical position between Africa, Asia, and Europe, Greece is an area of great significance for the study of the movement of the earliest human groups between these areas, yet the discovery of the Greek Palaeolithic is very recent, dating from the late 1950s and early 1960s, when the first finds of stone tools were made in Thessaly and Epirus. The earliest and most important discovery to date is the human skull found in 1960 in the cave of Petralona, 75 km northeast of Thessalonica. The skull, which was initially thought to be that of a Neanderthal man (who lived in the middle Palaeolithic period) is now believed to belong to an archaic *Homo sapiens* (a more advanced, though earlier human being than Neanderthal) and to be at least 200,000 years old, much older than any of the stone tools found on Palaeolithic sites in Greece.

The earliest stone tools recovered from excavations and surveys are 50,000–30,000 years old and belong to the Levallois-Mousterian industry characteristic of the middle Palaeolithic. This industry, which is characterized by bifacial leaf points, is generally associated with Neanderthal man, who probably penetrated into northern Greece from central and southeastern Europe after the beginning of the last glaciation (a Neanderthal skull has been reported from the Mani peninsula in the Peloponnese). During the glacial periods northern Greece was positioned between the extremes of cold in the north and aridity in the south, and because it may have supported larger pockets of tree cover than areas further south, it was a favourable habitat for animals, and hence for hunter-gatherers. The groups which populated northern Greece are believed to have been small (about 25 people on average), and an extensive area such as Epirus may have had a total population of no more than 50 people at any one time.

In Epirus investigations in rock shelters (Asprochaliko, Kastritsa, Klithi) and open sites (Kokkinopilos and Grava on Corfu, which would have been attached to the mainland at the time) have yielded substantial quantities of middle and late Palaeolithic flint tools, animal bones (particularly of red deer and caprines), fish bones, sea molluscs, and plant foods. Research carried out by British archaeologists has highlighted the importance of the environmental setting of sites, such as their altitude and orientation. The use of the different sites by the highly mobile hunter-gatherer groups would have been conditioned by the time of the year, which affected the seasonal movement of animals, and by the specialized function of any one site. Subsistence strategies would have changed over time, following climatic and environmental changes. Conditions were at their most unfavourable during the glacial maximum (*c.*18,000 BC), but gradually gave way to a warmer, wetter climate, leading to the spread of deciduous forests and the downcutting of rivers around 10,000 BC.

In Thessaly middle and late Palaeolithic tools and fossilized animal bones were found on the banks of the Peneus river, while caves appear to have remained uninhabited. In the

Peloponnese the most important upper Palaeolithic site is the large cave of Franchthi, where occupation started about 20,000 BC and continued into the Mesolithic and Neolithic periods.

The Mesolithic (8th millennium BC) is a period of change, which is particularly noticeable in the greater dependence on seafood, but in Greece sites dating from this period are very rare, probably because many were coastal sites and may have been swamped by the rising sea levels in later periods. At Franchthi the range of plant foods (nuts, legumes, and, for the first time, cereals) suggests a year-round occupation of the cave. The sea was the most critical resource for the provision of food, and for communications, as shown by the presence in the cave of obsidian from Melos. The earliest burials in Greece are also found in the cave in this period.

The momentous change to a subsistence economy based on agriculture and animal herding and the birth of the farming village in Greece date from the 7th millennium BC, in Thessaly, the Argolid (Franchthi cave), and Crete (Knossos). Except for Franchthi, the earliest Neolithic sites had not previously been occupied (Crete had not been occupied at all), and because the animal and plant species used by the earliest farmers were not indigenous to these areas, it seems likely that the settlers came from lands where farming was already established, most probably Anatolia, sailing across the sea with the first domesticated animals and seeds on board their boats. Some pioneering explorations must have been carried out prior to full settlement, as the farmers seem to have identified advantageous environments for farming. The major areas of occupation and subsequent expansion were in Thessaly, particularly the Larissa basin, and they attracted settlement because of their good arable soil and possibly the natural irrigation system, through river valleys and flood plains, which prevailed at the time.

The Greek Neolithic (7th–4th millennia BC) is divided into early Neolithic, middle Neolithic, and late Neolithic. Between the early and late Neolithic settlement expanded steadily and increased in density. It was particularly successful in Thessaly; just over 100 sites were established in the Larissa basin in the course of the 1000-year duration of the early neolithic, and the number had increased to 150 by the end of the late Neolithic. Some sites did not survive from one phase to the next, but several new ones were founded in their place. All areas of mainland Greece, including Macedonia and central and southern Greece, were occupied by the end of the early neolithic, and island settlement, previously confined to Crete, Alonisos, Corfu and Antiparos (Saliagos), increased during the late Neolithic to include Aegina, Ceos, Mykonos, and Naxos. Although it has been suggested that successive waves of farmers arrived from the east throughout the Neolithic, it is more likely that the initial influx of people into the area was not followed by any equally significant number of immigrants.

The characteristic site in this period is the farming village, situated on a ridge or knoll and numbering a few hundred inhabitants. The dwellings were initially flimsy, but by the middle Neolithic the prevailing building type was a structure which, although only one storey high, could be fairly large, had a stone foundation, a superstructure of mudbrick or *pisé* (layers of clay) faced with plaster, and a flat or pitched roof of wattle and daub. Buildings with a megaron plan (rectangular with two rooms of uneven size) make their appearence in Thessaly (Otzaki, Sesklo) in the middle Neolithic.

The main means of subsistence was the cultivation of plant foods: cereal (wheat, barley, millet) and pulses (lentils, peas, vetch). Of less importance was the herding of domesticated animals; sheep and goats predominate on excavated sites, with pigs and cattle in smaller numbers. Fish or game could play a supplementary role in the diet depending on the location of the settlement. Neolithic society is largely believed to have been egalitarian, with the whole community involved in food production. A move towards social differentiation may have taken place in the late Neolithic with the establishment of settlements on marginal lands.

Among the crafts, pottery making was the single most important innovation of the period. For a time the farmers of the earliest villages did not produce ceramic vessels (the phase is known as the preceramic Neolithic), but made extensive use of perishable materials such as wickerwork, matting, wood, and hide. Once introduced, pottery reached very high artistic and technical standards, though the potter's wheel was still unknown, and it was made in a considerable variety of styles; the surfaces were painted in one or more colours (polychrome), were impressed or incised, and the patterns were mostly geometrical (chevrons, triangles, spirals, etc.). There are both chronological and regional differences between the styles. Much of the fine decorated pottery must have been non-utilitarian. Tools were made of bone and stone (both polished and chipped), as were beads, pendants, and other ornaments.

Clay figurines are among the most attractive artifacts of Neolithic Greece. The largest group consists of steatopygic female figurines of different types, but there are also seated male figurines, and models of houses and furniture. Once thought to be fertility goddesses, the steatopygic figurines are today believed to have had a variety of functions, as their use for one specific cult cannot be inferred from their contexts in graves and houses. Ritual was an important element in the life of Neolithic communities. Although no structures have been unequivocally connected with ritual ceremonies, these may have taken place in open spaces, as in other cultures. The nature of Neolithic religion is unknown. Suggestions have been made that it was an "animistic religion" and, if so, the figurines may represent the spirits of ancestors.

The Neolithic was a period of increased communications, by sea as well as land. Similarities between pottery styles and the movement of materials from one area to the other reveal contacts between settlements and regions. The most frequently imported material, and one which travelled in great quantities over great distances, was obsidian from Melos, out of which the sharpest cutting tools were made.

The greatest strides in the study of Greek prehistory have taken place in the last decades. New sites are being discovered with every new survey, and ongoing research is taking place into artefacts, as well as other areas relevant to the understanding of prehistoric man: strategies of exploitation of the environment, transmission of agricultural economy, seafaring, and human colonization of the islands. Progress has been made through the use of scientific techniques for dating deposits and sites, and for reconstructing the palaeoenvironment, but there

is much scope for work leading to a better knowledge of important environmental aspects, such as the configuration of the Greek shoreline, particularly during the Palaeolithic, and changes in climatic conditions and vegetation cover. More accurate dating of neolithic sites would lead to a better understanding of the divisions between periods, and of the correlations between the different local cultures and assemblages during the period.

In modern Greece the Neolithic period arouses a fair amount of interest, among both archaeologists and the general public. It is regarded as the period when many of the "good things" in our modern civilization first appeared, including art, religious thought, and above all farming and the village way of life, both of which have remained fundamentals of Greek life to this very day. Moreover, figurative art appears for the first time in this period, as do other more specifically "Greek" forms, like the megaron building plan. By contrast, the study of the Palaeolithic (and the Mesolithic) has yet to be assigned the position and given the support it enjoys in other countries. That it has not achieved such status may be due not only to the fact that it is still in its infancy or to the more impressive character of the products of later Greek cultures, but also to the fact that the achievements of man in this period are seen as having more significance at a global rather than at a national, Greek level. One of the leading archaeologists in the field, Geoff Bailey, made a plea in 1992 for increased support for training and research in Palaeolithic archaeology within Greece, stressing that this is the period when our species "acquired those most fundamental characteristics by which we define our humanity". It therefore deserves, and let us hope will receive, greater recognition in the future.

Prespa, Lake

Lake Prespa is one of the most remarkable natural phenomena in the Balkans. The most northerly border of Greece passes through the lake, as do those of the Former Yugoslav Republic of Macedonia and of Albania. With Lake Ohrid, 30 km to the north, to which it is linked by underground water channels, it forms the Prespa World Heritage Park, as designated by UNESCO. There are actually two lakes in the region, Great Prespa and Small Prespa, divided by a narrow causeway. Great Prespa is an important wildlife refuge, although bird life has been adversely affected by falling water levels in the lake in recent years.

In ancient times there were Greek fishing settlements around the lake, but populations were small until the Roman period, when larger villages sprang up in connection with trade along the Via Egnatia that ran to the north of Lake Prespa. Prespa was an early centre for the growth of Christianity, and in the medieval period played a seminal role in the spread of Christianity to the Slav-speaking world. There are some important rock icons painted in caves above the lake that were once occupied by hermits, and many small churches and shrines in the vicinity. This Christian activity continued while Ohrid was an important town and religous centre under the Bulgarian empire. In Ottoman times the vicinity of the lake fell into economic decline and the extensive forests became notorious as centres of banditry and outlaws. The Prespa villages suffered badly in the Ilinden uprising in 1903, and in the First Balkan War in 1912. The lake remained within European Turkey until 1913.

Today the area of the lake has a complex ethnic mosaic, with most inhabitants in all three countries being of basically Slav descent. The Macedonian language is widely understood and spoken, but there are also substantial numbers of Vlachs, along with a few Albanian-speakers who have crossed the border in recent years. The main Greek element consists of people who were moved to this area after the influx into Greece of Asia Minor refugees after 1922, and others of a "national consciousness" who were moved here after the end of the Civil War in 1949. From 1946 to 1949 the headquarters of the Democratic Army of Markos Vafiades was situated near the lake, and it was bombed by the RAF and the United States Air Force in 1948–49.

The main village on the Greek side of the lake is Psarades, a fishing settlement of about 400 people. There is a very fine church, financed by a Russian philanthropist in 1906. Before the Civil War, Psarades was known as Nivica. Many inhabitants fled to Yugoslavia or Russia after 1949, and only returned in 1982 after the PASOK government amnesty for Civil War participants. In recent years some small-scale ecotourism has developed in the region. The main Vlach villages near the lake are Pili and Vronderon.

Summary

Lake Prespa lies on the border between Greece, Albania, and the Former Yugoslav Republic of Macedonia. It is connected to Lake Ohrid by underwater channels, and together they form the Prespa World Heritage Park. The area saw heavy fighting in the Greek Civil War. Most inhabitants today are of Slav descent, though there are Vlachs and Albanian-speakers too.

Prevelakis, Pantelis 1909–1986

Novelist and poet

Pantelis Prevelakis, one of the most prominent Greek authors of the 20th century and a member of the so-called 1930s generation, was distinguished in many different genres of writing. He was born in the city of Rethymnon in Crete in 1909. Although he went to Athens to study law, he in fact studied art and literature in the universities of Athens and Paris. From 1935 he was a professor of art history at the School of Fine Arts in Athens. Very well educated, he was a prolific writer. His works include poetry, novels, plays, and critical essays.

He first appeared as a writer in 1928 with a collection of poems entitled *Soldiers* and in 1930 with a historical monograph, *Domenico Theotokopoulos*, in which his writing skills and his knowledge of art history are well combined. In 1939 he produced his first historical novel, *The Death of the Medici*. He was a loyal student of his teacher Nikos Kazantzakis, whose influence on Prevelakis is so strong that it puts him in the shade. The comparison with Kazantzakis is almost self-evident and has done undue damage to the reputation of Prevelakis. His critical volume *Nikos Kazantzakis and his Odyssey* is an excellent piece of literary criticism. With *The Naked Poetry* (1941) and *The Hours on a Greek Island* (1945) he reached his poetic maturity, enhanced by an ideological development associated with World War II.

Prevelakis began exploring his Cretan roots in prose in the novels *The Chronicle of a Town* (1938) and *Desolate Crete: The Chronicle of the Rising of '66* (1945) which, as the subtitle suggests, is about the 1866 rising in Crete, and the trilogy entitled *The Cretan: The Tree* (1948), *First Liberation* (1949), *The City* (1950). His work embodies the uncompromising struggle for liberty. In *The Cretan* he focused on the personality of Eleftherios Venizelos, the new political hero of the time who was charged by his Cretan soul to lead the Greek people. This work revealed the strength of Prevelakis's writing skills and his deep interest in contemporary reality. Another trilogy followed: *The Sun of Death* (1959), *The Head of Medusa* (1963), and *The Bread of Angels* (1966). His memories of his Cretan past were very important and there is often a sensitive autobiographical tone in his writing. The historical element was also an important aspect. His town of origin, Rethymnon, held a key position in his work: it represented all the ideological and emotional tensions that Prevelakis went through while trying to define himself. He was haunted by a crystallized idea of a certain lifestyle that he had known in Crete and wanted to know again whether or not he was still defined by the same place and lifestyle after all his travels and experiences. He sought to bridge the gap between his youth and maturity, with a need to refer to his own "Ithaca". He also published books on art history early in his career as an academic: *Italian Renaissance and Art* (1935), *Art in Modern Greece* (1938), *El Greco in Rome* (1941).

As many of Prevelakis's titles suggest, Crete and his notion of heroism were cardinal motifs in his work. It is often said that history outweighs fiction in his writings. He chose historical subjects for his plays as well, such as Florence under the Medici or the blowing up of the monastery of Arkadi. Once again the tragic aspect of life is the one that appears on his stage. All of his theatrical works – *The Sacred Massacre* (1952), *Lazaros* (1954), *The Hands of a Living God* (1955) – describe a moment of inner crisis and present a soul in constant dialogue with death. His faith in his heritage and the concept of tradition in a time of transition marks not only his humanism but also the path he chose as a writer. He did not believe in a modernity that denied its roots; on the contrary the tradition that he drew on proves to be in a constant state of dynamic renewal. His work *The Hands of a Living God* is overtly indebted to Dostoevsky, reflecting the dramatic process of a conscience. In his last work, *The New Erotokritos* (1971), using the traditional 15-syllable verse, he discovers a new lyric identity. With this work Greek poetry regained its link with tradition, creating at the same time a marriage between the traditional and the innovative. This is not the only marriage, however, since he also united the personal with the national, the fictional with the historical, the real with the symbolic. The complexity of this work reflects the synthetic mind of its writer. It is written in rhyming couplets, like its predecessor by Vintsentzos Kornaros, yet every couplet has a lyric autonomy, being in this way close to the folk-song tradition. The language in his novels and poetry owes much to the Cretan dialect of his time, although it is more polished. He published more than 30 books, poems, novels, essays, biographies, plays, and translations of other works, and was elected a member of the Academy of Athens.

Biography

Born in Rethymnon in Crete in 1909, Prevelakis was destined for a legal career. But instead he studied art and literature in the universities of Athens and Paris. He became a professor of art history at the School of Fine Arts in Athens and also studied under Kazantzakis, with whom he is often compared as a novelist. He also wrote poetry, drama, and criticism. He was a member of the Academy of Athens. He died in 1986.

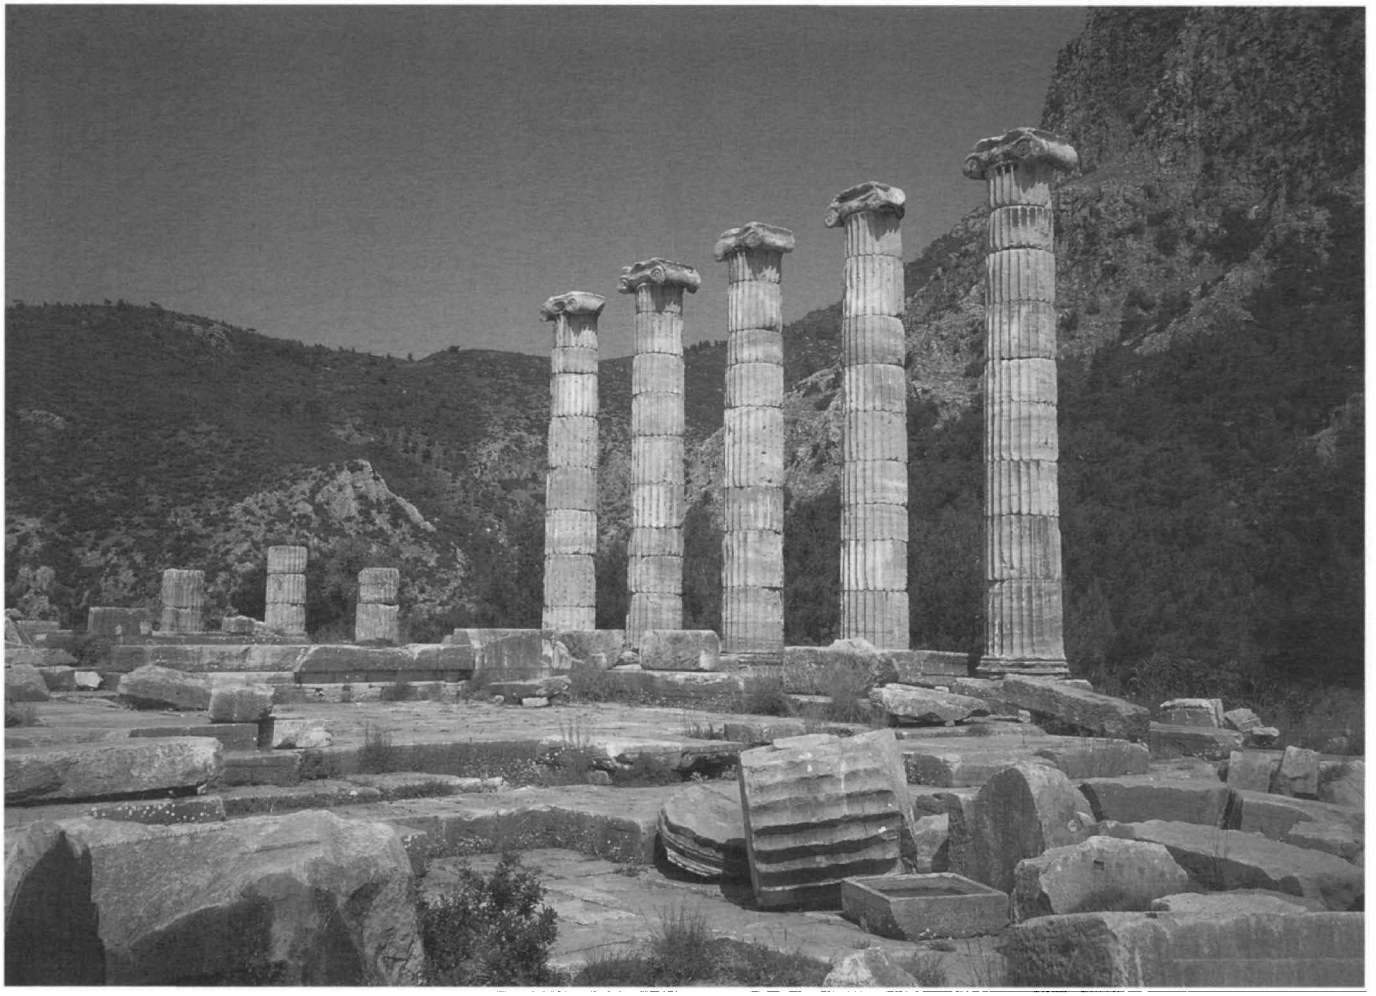
Priene

City in Ionia

Priene was a small Greek city (population *c.*4000) on a peninsula in Asia Minor *c.*30 km south of Ephesus that flourished



Priene: temple of Athena, dedicated in 334 BC

from the mid-4th century BC throughout the Hellenistic and early Roman periods. It is notable for being one of the most intelligible examples of ancient town planning, and its remains include most forms of public and domestic Greek architecture. The buildings, which are laid out on a grid plan, sit on the southern slope of Mount Mykale overlooking the Meander valley, *c.*15 km from the sea. In antiquity Priene was connected by a branch of the Meander river to its seaport at Naulochos on the bay of Latmos. The river silted up over time, however, causing the bay to become landlocked, and the city diminished in importance in later Roman times without access to a harbour.

Priene seems to have been founded originally at a different location, perhaps as early as the 2nd millennium BC, but its early history is known almost entirely from ancient authors, including Strabo, Herodotus, and Pausanias. In the 7th century BC it was one of the 12 major cities of Ionia and a member of the Ionian League. In the 6th and 5th centuries BC Priene was variously under the influence of the Lycians, Carians, Lydians, Phrygians, Athenians, and Persians. The city was refounded, probably by the Persian satraps the Hekatomnids, at its present location *c.*350 BC, and it is from this date and throughout the Hellenistic period that most of the extant remains come. Priene, along with the other Greek cities of Ionia, was freed from Persian domination in 334 BC by Alexander the Great, who lived there while he laid siege to Miletus on the other side of the bay of Latmos. After Alexander's death Priene came under the control of various Hellenistic kings – Lysimachus, the Ptolemies, the Seleucids, and the Attalids. Upon the death of the last Attalid king in 133 BC, Priene passed into Roman hegemony along with the rest of the kingdom of Pergamum. By the 3rd century AD, with the river silted up, the city dwindled to a town half its original size.

Priene was designed according to the philosophy of orthogonal town planning that was promoted by the renowned 5th-century BC architect Hippodamus of Miletus. Facing south to provide maximum light during winter, it was surrounded by a defensive wall with the main gate on the northeast and subsidiary gates on the southeast and west. High above and behind the city on the summit of Mount Mykale was a walled acropolis that was a permanent station for a military garrison. The urban water supply flowed down from the summit by aqueduct to reservoirs on the northeast of the city, and then was piped to public buildings and fountains. The streets were laid out as a grid, the six major streets on the east–west axis comprising a main thoroughfare 7.36 m wide and five others 4.44 m wide. These were intersected at right angles by narrower streets, 3.5 m wide, most of which incorporated steps because they lay on the north–south slope of the hill. The standard city block (insula) was 120 × 160 Attic feet. In the public

areas of the city the buildings often took up an entire block or more, while in the domestic quarters each insula usually accommodated four houses.

Priene displays all the components necessary to the Classical Greek city (polis). At its heart was its major monument, honouring the city's patron, the 4th-century BC temple of Athena. An inscription states that it was dedicated in 334 BC in the name of Alexander the Great, who furnished the funds that were needed to complete basic construction. The temple was built by the renowned Carian architect Pytheos, who was esteemed as well for his work on the Mausoleum at Halicarnassus, one of the seven wonders of the ancient world. As was common practice among famed architects in antiquity, Pytheos wrote about his general architectural theories and he used as illustration the temple of Athena at Priene. His book, unfortunately, survives only in the commentary of Vitruvius. The ceiling of the peristyle was highly unusual in that it contained coffers carved in very high relief with scenes depicting gods fighting Giants and Amazons. The statue of Athena that stood within the cella was a replica of the colossal figure of Athena from the Parthenon in Athens. In front of the temple was the altar of Artemis, an ornate rectangular structure adorned with nearly life-sized figures carved in high relief set between attached columns.

To the east of the sanctuary of Athena was the commercial and social centre of the city, the agora. This large, open rectangle (75.64 × 35.40 m) contained various shops and was the site of many public meetings and festivals. To the north and south of the agora were other public buildings: the bouleuterion, the council house; the prytaneion, a smaller administrative building; stoas; gymnasia; a stadium; various temples and sanctuaries; and the theatre, whose ruins are impressive especially since they preserve the 2nd-century BC stage building more completely than at most other sites of the period. Filling the insulae on the west and east sides of the city were private dwellings. The large number of houses surviving at Priene is particularly propitious, for ancient Greek domestic architecture can be studied to this extent at few other sites. The houses were relatively small, with several rooms surrounding an open court. While most appear to have been of one storey, some preserve stairs that would have led to an upper level.

Although Hippodamus was esteemed by Hellenistic Greeks as the inventor of formal city planning, Priene as a visual expression of his ideas was a relatively late example of orthogonal urban design. In the 2nd millennium BC Egyptian workers' villages at Kahun and Tell el-Amarna consisted of housing built in rectangular blocks along parallel streets. In the 5th century BC Herodotus (1. 180) describes the streets of Babylon as a grid, all being either parallel or perpendicular to the Euphrates river. In the Greek-speaking world, in the 7th century BC, both Smyrna in Asia Minor and Megara Hybleia in Sicily were built with parallel streets on orthogonal plans. Priene's position in the heart of the Hellenistic world provided it with greater influence than its size might otherwise have inspired. The fact that it was the site of an important temple built by a major architect also brought the city an extra measure of attention. Cities that were built or rebuilt under the Hellenistic kings or Roman emperors, e.g. Miletus, most assuredly were influenced by knowledge of orthogonal town planning at Priene.

Priene's influence seems not to have continued beyond the 3rd century AD when the city lost half its population and fell into disrepair. From that time it consisted primarily of poorly built houses and shops – constructed of materials from Hellenistic ruins – that extended over the original city streets destroying the grid plan. Priene was deserted from the 7th to the 10th centuries. Between the 10th and 13th centuries the site was reoccupied and Priene was a bishopric of the Metropolitan of Ephesus. But as with other bishoprics of impoverished Ephesus (e.g. Pergamum, Didyma), it was merely a small village of modest houses and chapels, and the bishop must have been little more than the equivalent of a parish priest. By the end of the 13th century Priene was deserted.

PAMELA A. WEBB

Summary

Priene was a small Greek city on the Meander river in Ionia (western Asia Minor) that flourished from *c.*350 BC to the later Roman empire. It is most notable as an example of Hippodamian town planning on the grid system, and for its wide variety of remains of public and domestic architecture. In late antiquity the river silted up and Priene lost its harbour and with it its importance.

Priesthood

In Mycenaean Greece the king discharged religious functions that, for want of a better term, may be identified with those of a high priest. In Athens these functions came in time to be invested in an elected magistrate known as the *archon basileus* or king archon. However, in no period in antiquity did there exist any institution exactly comparable to our notion of priesthood. The word *hiereus*, which comes closest to "priest", denoted an official attached to a particular sanctuary who supervised the *hiera* (sacred objects) stored within that sanctu-

ary and who conducted the sacred rites connected with the cult. The most important of these were the performing of sacrifice, the purification of the sanctuary, the punishment of those who violated sanctuary regulations, and maintaining the buildings in good repair.

Since Greek religion did not concern itself much with morality, priests never functioned as spiritual advisers; their duties were primarily those of a liturgical and administrative nature. They were debarred from playing any part in the ceremonies connected with birth, marriage, and death because of the pollution that was believed to be associated with these events. Priests also lacked the technical competence and skill to pronounce upon matters arising from the practice of religious ritual; instead, when problems arose, particularly those having to do with pollution, religious experts known as *exegetai* were consulted.

Eligibility for priestly office was based on external qualifications. The most important qualification was the absence of any blemish or deformity, since it was believed that a blemish constituted evidence of divine disfavour. So far as we know, priests did not have to undergo any formal training, though they obviously had to be adept in the performing of their religious ritual. Since most temples were open to the public only a few days of the year, the holding of a priesthood was generally a part-time occupation. Priests were not paid for their services, though they were entitled to portions of meat from all the sacrifices performed in the sanctuary over which they had charge. Some had special seats of honour in the theatre of Dionysus. The more important priests were distinguished by their dress; the Hierophant of the Eleusinian Mysteries, for instance, wore a mantle, probably of purple, a headband surmounted by a wreath of myrtle, and carried a staff.

As a general rule, gods were served by priests, goddesses by priestesses. Some priesthoods were hereditary, others were for a fixed term. In democratic Athens the newer priesthoods were annual appointments for which all members of the citizen body were eligible. The more venerable ones, such as that of Athena Polias or Poseidon Erechtheus, were reserved for members of a particular *genos* or noble kin-group. With few exceptions the powers of a priest were strictly curtailed and there is no evidence for any involvement *qua* priest in politics. Even in matters that had to do with religion, it was the citizen body as a whole, rather than the priesthood, that took all major decisions, without consulting the priesthood, at least in any formal way. Priests were not in a position to challenge the legal or political authority of the state because they never acknowledged any corporate identity. Thus when Socrates was accused of violating religious law in 399 BC, a group of indvidual citizens conducted the prosecution. Even so, it is probable that the major priesthoods carried considerable prestige. The priestess of Hera in Argos was so important that the Greeks based their system of chronology on the number of years that she had been in office (Thucydides, 2. 1).

The concept of the Christian priest emerges towards the end of the 2nd century AD, largely due to the teachings of Cyprian. Priests now became celebrants of the Eucharist, a role previously confined to bishops. During the period of Turkish occupation, priests often served as intermediaries between the Turkish authorities and the Greek people. It was a priest, Germanos of Patras, who began the revolt against the Turks in the Morea in 1821, thereby instigating the War of Independence. Priests receive little money for their services and in order to supplement their salary they may charge for the baptisms, liturgies, exorcisms, and other services that they perform. They are permitted to marry before (but not after) ordination. The Greek Orthodox priesthood falls under the jurisdiction of the four patriarchs, those of Constantinople (properly known as the ecumenical patriarch), Alexandria, Antioch, and Jerusalem.

Printing

The beginnings of Greek printing are inextricably linked with the humanist current predominant in the period of the Italian Renaissance, and in particular with the desire of humanists, most of them Italian, to preserve works of ancient Greek literature, either in the original or in Latin translation. Byzantine scholars had begun to teach Greek in the West as early as the late 14th century, and Italian printers were the first to turn to the printing of Greek.

Greek incunabula (works printed before 1500) form a corpus of 80 books, published in three main cities: Milan, Florence, and Venice. The rest come from cultural centres of lesser importance, such as Parma, Vicenza, Brescia, and Reggio nell'Emilia. These works were for the most part grammars and dictionaries, though some of the monuments of Classical literature were also published, among them the five-volume series of the entire corpus of Aristotle's writings (Venice: Aldus Manutius, 1495–98), the complete works of Homer (Florence, 1488–89), the comedies of Aristophanes (Venice, 1498), and others.

The first endeavour to print a Greek book is dated around 1471, in Venice, and was due to the German printer Adam de Ambergau. The work in question was the *Erotemata* of Manuel Chrysoloras, in a Latin version by Guarino Veronese, which included extensive extracts in Greek. The first continuous Greek text was again Chrysoloras's *Erotemata*, which was printed with no indication of the date, place of publication, or printer, though probably in Bologna or Florence around 1475. The first dated Greek book was printed by Dimitrios Damilas of Crete in 1476, at the press of Dionigi Paravicino in Milan. It contains the *Epitome of the Eight Parts of Speech* by Constantine Laskaris, another grammar for the teaching of the Greek language to westerners.

Two Greek presses were established, both of them in Venice, before 1500, by Cretan men of letters and printers. The first operated in the house of two priests, Laonikos and Alexandros, for about a year, in 1486, and produced the

Psalter and the *Battle of Frogs and Mice*. The second, which was one of the most famous of the early presses, functioned from the beginning of 1499 to the end of 1500 and published the following works: the *Etymologicum Magnum* and the *Commentary on the Ten Categories of Aristotle* of Simplicius in 1499, and the *Commentary on the Five Voices of Porphyry* by Ammonius and the *Therapeutics* of Galen in 1500. To print these books, one of the most elegant character sets ever designed was cut by Zacharias Kalliergis; the texts were edited in part by Nikolaos Vlastos, who also financed the publications.

The Italian presses that published Greek books included those of Giovanni da Reno, Lorenzo de Alopa, Pellegrino de Pasquali, Uldericus Scinzenzeler, and others; the most famous of all, however, was that of Aldus Manutius in Venice. From 1494 Aldus collaborated with Greek scholars to print a large number of Greek books, totalling 18 incunabula, the first of which was the *Hero and Leander* of Musacus.

From the early decades of the 16th century, after the deaths of Aldus (1517) and Kalliergis (after 1523), the production of Greek books ceased to depend on Greek teachers and their pupils. The Italian presses, and also those in the north (Basle, Paris, Lyons, Strasbourg, and Frankfurt), were staffed by a considerable number of fine Hellenists and published important works of Greek literature, as well as first editions of the Church Fathers, in this way lending support to local humanist studies. The Greeks of the diaspora and Venice, for their part, realized that it was essential to publish "tools" for the teaching of Greek to the scattered Greek population, as well as liturgical books for the needs of the hundreds of Orthodox monasteries and churches to be found in the territories of the Ottoman empire. In view of the prohibition on the practising of the printer's art, though not the distribution of books, in the territory of the Sublime Porte, the Greeks of the diaspora successfully established publishing houses in Venice that functioned without interruption down to the early decades of the 19th century.

The presses founded in Venice were the fruit of the cooperation of Greek merchants, men of letters, and printers, and also Italians who owned printing workshops and the appropriate materials to print Greek texts, and who possessed the necessary permits. The most important establishments to emerge were those of Andreas Kounadis, Damiani di Santa Maria, Andrea Pinelli, Nicolini da Sabio, Nikolaos Glykys, Nikolaos Saros, Antonio Bortoli, Dimitrios Theodosiou, and many others. Commercially, many printers collaborated with these publishing–printing centres and businesses frequently changed hands or were financed by different supporters.

For their subject matter these presses relied mainly on the contents of liturgical books, such as gospel books, Menaia, anthologies, lives of saints, intercessions, books of hours, and prayer books. Nevertheless, a significant role was also played by many publications of a popular nature, which began to appear in the second decade of the 16th century with texts written by members of learned circles in Crete – books such as the *Apokopos* by Bergadis, the *Mourning for Death*, the *Story of Sossana*, and others. Another major source of material for the publishing programmes of these houses consisted of new editions of grammar books, mainly the *Grammar* of Manuel Chrysoloras, and those of Constantine Laskaris and of Theodore Gaza. These were aimed at the learned Greek public and the teaching staff of the private and monastery schools in the East.

In addition to the major centres of Greek printing such as Venice, efforts began in the early decades of the 17th century to establish presses in other centres of Hellenism. The first of these attempts was by the ecumenical patriarch of Constantinople, Cyril I Lukaris who, beginning in Lvov, Poland, and thereafter in collaboration with Nikodemos Metaxas in Constantinople, endeavoured to set up a press in the Phanar, in 1627. Lukaris's purpose was to circulate Greek books whose content would counter the proselytizing policy of the Catholic Church and Jesuit propaganda directed at Orthodox Christians.

Between this time and the end of the 18th century, Greek presses were founded in Mount Athos, Moschopolis, Bucharest, Jassy, Vienna, Trieste, Moscow, and St Petersburg, as well as Constantinople. The ulterior motive of these centres was to produce books not only to educate Greeks everywhere and to maintain Orthodox beliefs, but, from the beginning of the 18th century, also to disseminate the ideas of the European Enlightenment.

The most important centre of the Neohellenic Enlightenment was Vienna. Here the output of the Greek and Viennese presses was completely different from the traditional publishing map of Greek books: translations of European literature, scholarly treatises, new grammars and dictionaries, texts giving expression to modern Greek literature and poetry, as well as newspapers, literary journals, and single-sheet pamphlets of a nationalist revolutionary content. Printers of the calibre of Georgios Ventotis and the Markidis Pouliou brothers were active in Vienna, which not only developed into the most important publishing centre of Hellenism from the late 18th century on, but was also the centre from which the distribution of Greek books to the length and breadth of the countries around the Mediterranean was efficiently organized through a system of prior enrolment and permanent subscription.

Printing presses began to be established systematically in Greece from the early decades of the 19th century, as a result of the various historical circumstances that stamped this period. Presses were set up successively on Corfu (1798), Zakynthos (1819), Chios (1819), at Kydonies (1819), Kalamata (1821), Corinth (1821), on Hydra (1823), and at Missolonghi (1823). The pamphlets published by these presses were related to administrative decisions and decrees, and their revolutionary or informative content was associated with the Greek national uprising in 1821.

Printed works began to appear in Athens in 1824, at the instigation of the British colonel Leicester Stanhope, who believed that a press ought to be established in the seat of the new government to meet its needs for newspapers and other printed matter. Since that time, especially after Athens was proclaimed capital of the newly founded Greek state, important publishers and printers have honoured the age-old tradition of Greek books, and there are still some functioning presses that perpetuate the art of Gutenberg, such as those of C. Manousaridis, A. Kaliakatsos, and others. Athens and Thessalonica virtually monopolize the production of Greek books, which in recent decades has been aimed at the publica-

tion not only of original works, but also of a good many translations of international literature.

Proclus AD 410/11–485

Philosopher

Proclus was head of the philosophy school at Athens from AD 435/36 until 485. By this time Neoplatonism had covered most of ancient Greek thought, including Aristotelianism, so there was no other philosophical school. Proclus taught and wrote on logic, theories of being, properties and causation (metaphysics); on knowledge, perception and truth (epistemology), theology and revelation, mathematics, physics, astronomy; and on the literature of Homer and Hesiod.

He was born in Constantinople but his family soon left for their family home, Xanthus in Lycia, probably around AD 415, to avoid the persecution of "Hellenes" (pagans) by the empress Pulcheria. He was sent to Alexandria to study law and to follow in his father's career, but underwent a conversion to Athenian philosophy while on a temporary visit to Byzantium at the time of the empress Eudocia's patronage of Hellenic learning and the institution of a university there (AD 425). At the age of 19 he went to Athens, where he studied Aristotle and Plato. He was elected head of the richly endowed Athens Academy at the age of 25; there he remained until his death aged 75, in the reign of the emperor Zeno.

Proclus asserted that the analysis of being leads to more simple and universal principles: from *physis* (nature) and *psyche* (soul) to *nous*, Life, and Essence. The simple are also more deep and fundamental: that renders them less explicit. Ultimately there is an unconditioned principle which can only be referred to as "the One" (*to hen*), but cannot be captured by any word or definition. Every entity, a stone, a human, or the world as a whole, is composed of the appropriate levels, plus its own "one" (*henas*). Each analytical level is known with befitting means: physical phenomena with the senses; mental images with imagination, conceptions, scientific laws, and mathematical objects with the reasoning mind; permanent, atemporal realities with direct intellection; the transcendent with faith (*pistis*), an intimate but incommunicable union between knower and object.

Things are defined and known by their properties. The latter originate in exempt, "imparticipable" realities (*hypostaseis*), but become known when they are correlated with, "partaken" by mind or experience. A "manifest" property is thus an "image" (*eikon*), representation, or a phenomenon. Proclus conceived of properties dynamically. A property in its "imparticipable" state "remains" unqualified. It spontaneously "proceeds", thereby informing others. It recovers its identity by "returning". Creation is a "procession"; contemplation and salvation are "returns".

Philosophy and theology have the same objects, just as metaphysics is the study of God (since Plato and Aristotle). For Proclus, the "ones" of self-sufficient realities are the deities of philosophical or popular religion. The scale of unity correlating with being is also the scale of divinity. The principal One is the all-transcendent God, but, for example, the "one" of principal Essence is God the Father, the "one" of principal *nous* (Intellect) is God the Creator, and the "ones" of subsidiary entities are the angels or incarnate saviours. The "procession" from reality to phenomena is thus accompanied by the descent of divine light to matter. This makes possible the salvation of mortal beings, which is the recovery of their unity. However, Proclus stressed that divinity is not fully fathomed by thinking, because it is indefinable. Theology needs something more, an active sympathy, *theourgia* ("divine work").

All beings, down to the lowest matter, partake of the Good God, but each in their own qualified manner. Evil results from ignorance, weakness, or some deficiency. According to Proclus, evil itself is nothing, a privation subsisting parasitically (*parhypostasis*: a "parallel existence").

Platonists reasoned that personal life, *psyche*, is a substance capable of life independent of the body. *Psyche* acts purposely, which implies rationality and volition. So psychology extends to metaphysics, life, mind, and ethics. For Proclus, *psyche* is in essence incorporeal and atemporal but its activities occur in some space or time. *Psyche* causes the body to move this way or that. Internally, it makes manifest dimensional images: the process of imagination. Images formed by the reasoning mind can be compared to those impressed by the senses, and correct them. However, for *psyche* to have full awareness of its unlimited source of inspiration, the *nous*, it must "return" by "ascending" to its proper level. From this level it "descends" when it becomes embodied. It falls because of its "daring" (*tolma*) generated by the individuality of its consciousness.

Science bridges the senses with reality, and provides understanding. Studying mathematics integrates reasoning with imagination, and trains the mind to contemplate. Mathematics mirrors the grand scale of being and knowledge. It extends from concrete things (mechanics and other applied mathematics) to abstractions, and then from models of reality to the hidden reality itself. Proclus was an observational and theoretical astronomer, and a physicist. He had the courage to reject Ptolemy's cosmology and Aristotle's physics. By applying his graded metaphysics, he proposed that the heavens and the earth are made of the same elements, except that they are in different modalities. Thus he reunified the scope of physical science. Further, he concluded that the place occupied by a mass-body, or by the visible universe as a whole, is a

three-dimensional volume-interval. He advanced the novel theory that this "space" is a massless body, consisting of pure, invisible light.

Proclus taught many prominent figures, including Byzantine statesmen. His student Ammonius became head of the Alexandrian school, and using Proclus' lectures taught Simplicius and the Christian Philoponus. Simplicius went to Athens with another Alexandrian, Damascius, subsequently the last head of the Athenian school. After Justinian closed it (AD 529) Simplicius wrote his influential commentaries on Aristotle. Philoponus proved the greatest philosophical critic of Proclus. Nevertheless, Proclus' teachings were maintained by the Alexandrian philosophers, including Stephanus, the appointee to the imperial university of Constantinople.

Proclus' hierarchy of being and divinity was adapted by pseudo-Dionysius the Areopagite, and became central to Orthodox theology with Maximos the Confessor (7th century) and John of Damascus (8th century). Proclus' writings themselves continued to be studied by Byzantines through Psellos (11th century) to Plethon (15th century), or were deemed dangerous enough for renewed Christian refutation (Nicholas Methone, 12th century).

In Islam, Proclus influenced the Ikhwan al-Safa (10th century), a cornerstone of Shiite theology. In philosophy, the Arabs drafted compilations of Proclus' works under Aristotle's name. They were transmitted to the west as the *Liber de Causis*, and became an important source of Greek philosophy.

In the Latin west, Eriugena (9th century) promulgated the pseudo-Dionysian corpus. William Moerbeke, bishop of Corinth in the Latin occupation (13th century), translated Proclus' works and made them available to his friend, the Dominican theologian Thomas Aquinas. Proclus attracted great interest among western theologians, especially Nicholas of Cusa. During the Renaissance (Ficino, *et al.*) Neoplatonism and Proclus were important influences. Elizabethan literary figures such as Edmund Spenser also read Proclus. The trend continued to the 19th-century Romantics.

Proclus' mathematical science was valued by Galileo's circle, and profoundly influenced the 17th-century astronomer Kepler. In modern philosophy the editions of Proclus by the Frenchman Victor Cousin and the German Friedrich Creuzer opened him to the chief Idealists, particularly Hegel, who respected Proclus above Plotinus. In America Proclus was read by the Transcendentalists, notably Ralph Waldo Emerson.

Procopius of Caesarea

Historian of the 6th century AD

Procopius, "a writer who must be accounted the most excellent Greek historian since Polybius" (Bury, 1958, vol. 2, p. 419), was born in Caesarea, Palestine, in the early 6th century AD. Appointed the *assessor*, or legal adviser, of the emperor Justinian's chief general Belisarius in 529, he accompanied him on his campaigns until the early 540s. The stirring events he witnessed, combined with his Classical education, inspired him to write a detailed account of the wars waged by Justinian. Divided geographically into *Persian Wars* (books 1–2), *Vandalic Wars* (books 3–4), and *Gothic Wars* (books 5–7), his history narrates the progress of Roman campaigns in these three theatres of conflict. In the year 550 he not only completed the first seven books of the *Wars*, but also the *Anecdota* or *Secret History*. This latter work disappeared from circulation almost immediately, it seems, not to reappear again until *c.*1000, when it is mentioned in the *Suda* as a piece of *psogos* (invective) and *komodia* (satire) about Justinian, Theodora, Belisarius, and Antonina. Procopius continued working in the 550s, producing one more book of *Wars* (book 8), covering the ongoing campaigning in Italy and the Transcaucasus. He also composed a panegyric, the *Buildings* or *De Aedificiis*, detailing the building work undertaken by Justinian in Constantinople, the east, the Balkans, and north Africa. Both these works were probably produced around 554, although some scholars have preferred to place them later in the 550s. Procopius died soon afterwards, and should not be

identified with the homonymous prefect of Constantinople in 562.

Procopius is among the very few Greek historians of the Roman empire whose works have survived in their entirety (as far as is known), and it is clear that he was quickly recognized as the leading authority on the events he relates. Agathias of Myrina, who continued his history of Justinian's wars for the period 552–59, mentions that "he [Procopius] who was so learned ... had read the whole of history, so to speak" (*Histories*, 4. 26. 4, translated Cameron). Both Agathias and, slightly later, Evagrius Scholasticus made use of Procopius' *Wars*: clearly this work enjoyed wide distribution (as Procopius himself notes at *Wars*, 8. 1. 1), although the *Buildings*, like the *Anecdota*, vanishes from view until much later. Before the hiatus that overtook Byzantine historiography in the early 7th century, a considerable number of historians, such as Menander Protector, John of Epiphania, and Theophylaktos Simokattes, continued to write "classicizing histories" similar to those of Procopius.

Procopius is but one in a long sequence of what are known as classicizing historians, so called because they wrote in a style which strove to emulate the historians of the 5th century BC, Herodotus and Thucydides. Although some classicizing historians may have had only a limited knowledge of these historians' works, it seems clear that Procopius at least was well acquainted with them. He owes a greater debt, perhaps, to the latter than the former: he aims to write in an "Atticizing" style, adopts a Thucydidean formula for dating campaigns, and on numerous occasions echoes Thucydidean phrases and sentiments (most notably in his description of the plague that struck Constantinople in 542 (*Wars*, 2. 22–23, modelled on Thucydides, 2. 46–53, a passage that influenced several later Byzantine historians)). But the interest in the esoteric and anecdotal visible in the *Anecdota* and the *Wars* is more reminiscent of Herodotus, as is the preface to the *Wars*.

In later times Procopius, as a successful exponent of the Atticizing style of historiography, remained popular among the Byzantine elite. The *Wars* were highly regarded, but some books more so than others: the patriarch Photios summarized only the *Persian Wars* in his *Bibliotheca*, while the chronicler Theophanes preferred to incorporate into his work a résumé only of the *Vandalic Wars*. One scholar has referred to a "Procopius renaissance" in the 12th century; certainly his works were used extensively by the historian Zonaras, and influenced the style of John Kinnamos. Around the same time he is among the authors recommended by the bishop of Corinth, Gregory, who praises the political and deliberative oratory in his work. Belisarius, in many ways the main focus of Procopius' narrative, became a heroic figure in popular literature of the later Byzantine period, although many of the stories concerning him do not come from Procopius. The contrasting depiction of events in the *Wars* and *Anecdota*, which initially led scholars to doubt the attribution of the latter to Procopius, has proved fertile ground for writers of fiction. The first modern scholar of Procopius, Felix Dahn, based his nationalistic novel *Der Kampf um Rom* (1876) on the *Gothic Wars*, while Robert Graves's *Count Belisarius* (1938) is little more than an imaginative reworking of the *Wars* and *Anecdota*.

Although Procopius' reputation as a historian has declined since Bury's time, he remains probably the most valuable primary source concerning the reign of Justinian; and his works continue to provide the framework for modern accounts of the period.

Procopius of Gaza c.475–c.538

Christian rhetorician and teacher in the humanities

Procopius was very proud of the ancient city of Gaza where he was born and spent most of his life, a place to which he added distinction. Among the most prosperous cities of Palestine, at the crossroads of trade routes in all directions, Gaza was a major trading post and port, a provincial centre, and a meeting point of peoples and languages. By the time of Procopius it had become prominent in Christian terms as the site of an important episcopal see. At the same time, Gaza saw the existence, in a period of decline, of a late-flourishing school of rhetoric where the Christian context allowed the coexistence of traditional expressions of pagan Greek culture, a school that attained a distinction that drew students from a wide area.

Procopius came to be regarded as the most important of the "Triad of Gaza", the other members being his brother Zacharias and the rhetorician Aeneas whom he probably succeeded as head of the school (*c.*491–95). Also notable in the school was Choricius, a student of Procopius, from whose funeral oration, together with Procopius' own letters (166 survive), may be derived a patchy account of his life. The dates are subject to debate, with *c.*475–538 emerging as more probable than *c.*465–528. (He was said to have died at the same age as Demosthenes.) Starting with a good Classical education in his native city, he went on to Alexandria and perhaps elsewhere before returning to a salaried post in Gaza. He remained as a rhetorician with public duties and as a teacher, despite attempts to lure him away to Antioch, Tyre, and Caesarea. His letters show a man of wide acquaintance, including distinguished and influential contemporaries in the spheres of medicine, law, and the Church, as well as among professional colleagues and students. His correspondence includes personal communications and letters of recommendation and consolation. They contain elements of personal concern, social awareness, and learned humour, revealing aspects of city life and, on occasion, verging on the lighthearted. Written in a highly polished, rather artificial style, these letters exemplify a continuity of Attic prose. Not only in style, but in content, is to be found continuity, a generous range of pagan Classical allusion being juxtaposed with aspects of Christian belief.

Alongside the teaching activity of which Choricius spoke highly, Procopius left examples of his rhetorical skill, in particular his celebratory oration on the emperor Anastasius I (491–518). In a forceful work of panegyric, following a pattern set by many predecessors, he achieves a measure of individuality within the bounds of conventional form. Tracing the emperor's career and emphasizing his vital part in the war against the Arabs, he looks for a wider context. As the city is set within the empire, so the empire itself has its place in the life of the human race, as the orator adumbrates a view of world history and a theory of government. Anastasius is depicted as a strong ruler, concerned for his subjects, especially the poor, and accessible to all classes in his pursuit of universal harmony. He represents a living law and exemplifies morality. Though there are discreet omissions, as when Procopius passes over various controversial episodes and disputes on religious matters, he contrives to maintain some balance within his idealized account.

Within the Christian sphere Procopius is more noted for an activity very different from any so far considered. The bulk (and it is extensive) of what has come down to us consists of catenae (*seirai*) of commentary on books of the Bible, composed of lengthy excerpts from established writers who include Philo Judaeus, Origen, Basil, Gregory of Nyssa, Clement of Alexandria, and Theodoret. He compiled comments on the books from Genesis to Ruth, in longer and shorter forms, together with collections on Isaiah, Song of Songs, and Proverbs. These display little evidence of shaping by a mind conscious of exegetical principles. Procopius adheres to no interpretative school, merely setting down side by side comments in an eclectic mass.

Yet another aspect of his interests is found in the account he gives of a series of pictures, all on traditional pagan themes. Introducing them with a rhetorical flourish on the all-pervading power of love, he vividly describes mythological motifs, involving figures such as Theseus, Ariadne, Phaedra, and Hippolytus, with a strikingly sensitive evocation of scenes from the *Iliad*, where the reader is brought to stand in emotional involvement with the defeated Priam before Agamemnon. The grouping of figures and the subtle variations of landscape emerge in telling detail. In a rather different mode are a stylized set of declamations on Classical subjects, such as Venus, Adonis, and Spring.

Though the attribution has been disputed, it may well be that the fragments of a work in which the writer disputes views held by the Neoplatonist Proclus come from Procopius. Proclus had connections with Gaza and Aeneas wrote of the influence of Neoplatonism, selective in acceptance and rejection.

It is not easy to form a unified view of Procopius, the elements of his interest being so diverse. It has been suggested that the large number of pagan references point to a preconversion phase in his life. This is not a necessary supposition. It is quite conceivable that a Christian layman, sitting lightly to exegetical principles in his understanding of a Christian past, might have found himself able to draw in purely literary terms upon the imagery as well as the style of a pagan past. If he considered that the religious struggle was over, he could feel at ease with the richness of that literary and rhetorical heritage which he felt to be his.

Biography

Born in Gaza *c.*AD 475, Procopius received a good Classical education and travelled to Alexandria. He spent his life teaching rhetoric at the school in Gaza where his pupils included Choricius. He wrote widely – letters, panegyric, and biblical exegesis – in a polished Attic style. He was a member of the "Triad of Gaza", the others being his brother Zacharias and the rhetor Aeneas. He died *c.*538.

Prodromos, Theodore

Poet of the 12th century

Theodore Prodromos, also called Ptochoprodromos ("poor Prodromos"), lived at the time of the Komnenoi emperors, Alexios Komnenos (1081–1118), John II (1118–43), and Manuel I (1143–80), a contemporary of John Tzetzes. He was renowned for a strong satirical touch in his work and a propensity for complaining and begging. There is much philological debate as to how many people are referred to under the name Prodromos, some scholars arguing that there are two different people, others that there is only one. Various kinds of literature are believed to have been written by him, both prose and poetry, the content ranging from philosophical and rhetorical texts to satiric dialogues, religious, and even astrological poems.

Six poems are preserved under his name, known as the *Prodromika*, with a total of 2259 verses, all in the 15-syllable folk metre and in a language close to modern Greek syntax and morphology. They are petitions to the emperor, either John II or Manuel I Komnenos or other members of the imperial family. In the first poem the writer talks about his married life, contrasting his demanding wife with his stoic personality. In the second he complains about his poverty and requests some help from the emperor; there is no reference to his wife. In the third and fourth it seems clear that he has become a monk, and his barbs have as their target the monastic life. Again his descriptions are addressed to the emperor, whose patronage he seeks. In the fifth and sixth poems he complains about the misery that intellectuals have to go through, in comparison with other more lucrative professions. The strong autobiographical tone that he employs in his poems present an intense social reality and poses many questions, both from a narratological and from a historical point of view. Dimaras suggests that this is a hero of urban folk poetry, "who was presented each time by a different author and placed by him in social situations with different professions". The language contains many vernacular elements, and some works are believed to preserve the spoken language of the 12th century. If this is the case, and if Prodromos indeed came from an urban and even scholarly environment, then his choice is very significant for the history of the Greek language. A kind of popular wisdom is represented in the poems, revealing that, whatever his educational background, he was in contact with the oral tradition of his time. He mentions *Digenis Akritis* in two places in his work. His works are also an important source for the social history of his time. The "Prodromic" poems, even if they were not written by Prodromos, seem to be part of an extremely popular tradition. They circulated widely until late in Byzantine times, in many copies and in various versions. Adamantios Korais, a representative of the Greek Enlightment, edited some of the poems in his collection *Atakta* (1828). Korais was proposing his own solution to the Greek language problem, with the archaizing and the folk language competing strongly against one another, and the combination of the two in the Prodromic poems might well have provided him with some inspiration.

Although it has many defects from an aesthetic point of view, the *Rodanthe and Dosicles*, a romance written in 12-syllable verse (4614 trimeters), is a very interesting piece and is important for the history of the Greek novel. There was a revival and transformation of the Greek novel at this period and a protorenaissance in literature, which have been neglected by scholars. There was a rich novel tradition at the time of the Second Sophistic and in late antiquity that had a great influence on the 12th-century renaissance of the novel, both from the thematic and the linguistic point of view. Prodromos is also believed to be the author of a semi-philosophical dialogue on friendship in exile, and of an astrological poem of 593 political verses. Also attributed to him is a satiric poem, *Katomyomachia* (battle between cat and mice), written under the influence of the *Batrachomyomachia* (battle between frogs and mice) of the archaic Homeric corpus. He is associated with court poetry, verses that were recited at official celebrations and ceremonies. It is highly unlikely that all the above categories were part of one man's work, and the literary identity of Prodromos is unclear.

Biography

A variety of works written in the 12th century at the time of the Komnenoi emperors are ascribed to Prodromos (or Ptochodromos). It is unlikely that they were all written by one man. They include six autobiographical poems known as the *Prodromika*, the romance *Rodanthe and Dosicles*, the satirical *Katomyomachia*, an astrological poem, and a philosophical dialogue on friendship.

Proselytism

The Greek term "proselytism" denotes the process of conversion from one belief to another and is mostly used in a religious context. The adjective "proselyte" signified initially the Gentile convert to Judaism; the newcomers to Christianity were also called proselytes. Christianity as a prophetic, missionary religion had a message to deliver to the world and stressed the radical changing of one's life. The Christian notions of sin, repentance, and the need for salvation signified the renunciation of all one's previous beliefs and ways of life, which had to be replaced by the wholesale adoption of the Christian faith and mode of living, either through conversion or adhesion.

In contemporary Greek usage the term "proselytism" has overtones of coercion. According to a law dating from the Metaxas government in 1938, it denotes the process of intrusion into an individual's religious belief and conversion

through secretive, devious, and fraudulent means. Conversion may thus occur in exchange for material goods, job and education opportunities, upward social mobility, and related promises. Proselytism may also take place by betraying a person's confidence or by taking advantage of his or her mental deficiency, naivety, inexperience, ignorance, or an emergency. Proselytism is considered to be an act of unfair religious or ideological competition and constitutes a violation of the individual's own conscience.

Theoretically, proselytism should be distinguished from genuine conversion after a fair dialogue. It is also vital to distinguish proselytism from the freedom to teach non-Christian religions, either in schools or to the public. But historically speaking, it is not always easy to distinguish clearly between proselytism and genuine conversions to Christianity. Under the wider umbrella of Christian missionary efforts, there was a variety of conversion methods including those that followed in the wake of colonialist invasion and conquest. Furthermore, Christianity's own proselytizing practices were to a large extent felt to be self-justified: since it was about the spread of the sole true faith, almost anything was allowed.

In Byzantium the establishment of Orthodoxy was of utmost importance for its political ideology. Conquered people were Christianized in order to be smoothly integrated into the empire. It goes without saying that any deviation from Orthodox standards was forbidden. All dissidents, whether pagans or heretics, especially when these engaged in proselytizing efforts, were prohibited or faced various penalties and repressive measures.

A similar situation can be observed under Ottoman rule, when the Church was particularly interested in safeguarding Orthodoxy. This period was marked by the systematic proselytism by Roman Catholics in the Levant, especially by the Jesuits. In 1577 pope Gregory XIII (1572–85) founded the Collegio Greco in Rome to initiate Greek students into Roman Catholicism and to employ them later in the East. The Sacra Congregatio de Propaganda Fide, founded in 1622, and the Uniate Church worked towards the same ends. These acts often provoked a reaction from the patriarchate of Constantinople (e.g. in 1722) and even from the Ottoman authorities (e.g. in 1702). Despite these religious conflicts, it was in this period that the Greek term for religious freedom and toleration, *anexithriskeia*, was coined by Evgenios Voulgaris, but its semantic content differed from its western counterparts.

After the foundation of the Greek state the Orthodox Church, though deprived of its previous broad responsibilities, managed to retain its ideological authority, especially with regard to non-Orthodox currents and ideas. While its repressive potential was less strong than it had been before 1821, it was still in a position to condemn and occasionally to take harsh measures against proselytizing acts. A well-known case is that of Theophilos Kairis (1784–1853), who was condemned as the founder of a new religion to the detriment of Orthodoxy. From the beginning of the 19th century onwards, the most serious cases of foreign proselytism were undertaken by various British and American Protestant organizations, which developed wide missionary activities in Greece, ranging from translating the Scriptures and publishing to the founding of schools and mission stations. This provoked an Orthodox reaction, as manifested in patriarch Gregory VI's anti-Protestant encyclical of 1836, which, among other things, prohibited the Orthodox faithful from attending Protestant schools. Similar encyclicals were issued by the Church of Greece (e.g. on 22 March 1891). In Greek state legislation proselytism was also considered a major offence against Orthodoxy, the dominant religion (e.g. in the Constitution of 1844, Article 1, and that of 1864/1911, Article 1).

At present, Orthodoxy is still acknowledged as the dominant, established religion of the Greek state (Constitution of 1975/86, Article 3). The Church intends to keep the Orthodox faith that has been vouchsafed to it unaltered. Claiming a unique handle on truth, the Orthodox Church regards the existence of non-Orthodox on its exclusive Greek territory with disfavour. Its intention is to control them, defend itself, and warn its members through related encyclicals and long lists of heretical groups. These antiheretical measures are supported by the state and its legal system. This situation can be attributed to the close relationship between Church and state in Greece and the mythology about the inextricable historical connection of Orthodoxy with Greek national identity.

The privileged status that the Orthodox Church enjoys obviously implies certain restrictions regarding the circulation and dissemination of non-Orthodox systems and ideas. Proselytism is forbidden (Constitution of 1975/86, Article 13(2)) as a penal offence. Yet the simple right to be informed about or to teach non-Orthodox religions is hardly distinguished from proselytism. The latter is not confined to conversion through improper means, but is interpreted broadly and applied to a variety of cases, often leading to convictions. Discrimination against religious minorities is thus not uncommon, because of the fear that they might undermine the established religion and alienate Greece's traditional culture. While the freedom of conscience is accepted and "known religions" are allowed, religious rights for minorities are in practice restricted (e.g. concerning the establishment of their "houses of worship"). The related legal terminology is ambiguous and can be interpreted and applied inconsistently. Proselytism by non-Orthodox minorities is strictly prohibited; but proselytizing for Greek Orthodoxy through individual means or institutional mechanisms is encouraged. In some cases, though, legal measures against certain religious movements and their proselytizing methods are deemed justified, as was the case with Scientology (in Greece since 1983), which was forbidden in 1997 through a decision (no. 10493) of the Court of Appeals of Athens.

In fact, the Orthodox Church considers that all non-Orthodox religions are unacceptable, i.e. either as heresies or as erroneous beliefs. It is therefore not surprising that religious minorities (e.g. Jehovah's Witnesses, Roman Catholics, Protestants) feel endangered by this milieu, and some have appealed to international organizations (e.g. the European Human Rights Commission and Court) for protection, which have often decided in their favour. Yet the Church, supported by the state, does not intend to renounce its traditional exclusive rights on Greek territory. Such ambiguities create tension between the Orthodox Church and the religious minorities and subsequently between Greece and its European partners, while the demand for Greece's relative deconfessionalization and

greater liberalization in religious matters is repeatedly being voiced.

Prostitution

In ancient Greece the sex trade was not illegal and there was a ready market for prostitutes who, in contrast to later Christian sexual ethics, were not regarded as improper objects of male desire. For Athenian men, who usually married in their thirties and for whom marital fidelity was not a requirement anyway, females under the protection of citizens, whether unmarried girls or married women, were, at least formally, strictly off limits and erotic relationships with such women could attract the severest penalties. Sex with prostitutes was much less risky

and provided an outlet for "releasing the pressure of lust" (Xenophon, *Memorabilia*, 2. 2. 4).

Male prostitutes (*kinaidoi*) were much in demand; there was no overarching moral stricture on same-sex behaviour in antiquity and, while a man was expected to be the active sexual partner, the object of his desire could be male or female. However, just as relationships with respectable women were restricted, so too there were formal restrictions regarding male partners; men of actual or potential citizen status were considered improper objects of a fully sexual relationship. Indeed, there could be serious civic consequences for citizen prostitutes; those who subsequently exercised their civic privileges invited prosecution and civic dishonour (a good example is the case of Timarchus in the 4th century BC, documented in Aischines, 1). However most prostitutes in antiquity, male and female, were slaves, and thus had no status to compromise.

While the all-embracing term of *ergasia* ("trade") denoted prostitution in Hellenic antiquity, prostitutes did not comprise a homogeneous category and there existed a broad spectrum of practice and status for those involved in selling sex. At the bottom of the heap were common prostitutes (*pornai*) who walked the streets and worked in the brothels of the Piraeus and the Kerameikos, still Athens' red-light district today. For brothel workers (always female) life could be grim; in one 5th-century BC text a concubine who fears her lover may send her to the brothel resorts to poisoning him (Antiphon, 1. 14). Other prostitutes, male and female, sat in cubicles (*oikemata*) open to the street, displaying themselves Amsterdam-style to prospective clients.

The Athenian state involved itself in the regulation of prostitution: *pornai* paid tax to the state, while Philemon (fr. 4) claimed that Solon established state-run brothels for the provision of cheap sex to all citizens as a democratic measure. The state also controlled the fees of flute girls and male kithara players, hired to provide musical and erotic entertainment at symposia, often the site of sexual dalliance; the mere appearance of an Athenian woman at a symposium could bring her reputation into question (Isaeus, 3. 13–14). In later periods too public entertainers were assimilated to prostitutes, perhaps because of their public visibility.

Courtesans (*hetairai*), on the other hand, exercised at least some choice in the bestowal of their favours and were hired for companionship as well as sex. Courtesans who commanded extravagant fees (*megalomisthoi*) could become rich and famous; Phryne, possibly the model for Praxiteles' *Aphrodite of Cnidus*, was reputedly rich enough to rebuild the city wall of Thebes (Callistratus, *On Courtesans*). Sometimes permanent attachments to men resulted and it can be difficult to distinguish the courtesan from the concubine (Aspasia and Theodote, the mistresses respectively of Pericles and Alcibiades, are two examples). Prostitution could even provide a way out of slavery and there are many examples of men buying the freedom of a favourite girl; Herodotus (2. 178) claims that Rhodopis of Thrace was redeemed from slavery by Sappho's brother and became rich. However, Neaira of Corinth (a city renowned for its prostitutes) started life as a slave, was freed by her lovers, and then, following a legal prosecution, was sold again ([Demosthenes], 59). The sex trade offered a chance of social mobility to some but it was a precarious existence; prostitutes could come up in the ancient world, but they could also go down.

Certainly many ancient writers vilified prostitutes and condemned them for their extravagance and use of artifice; in the 4th century BC Alexis sneered at girls who compensated for their lack of natural charms with high heels, make-up, false breasts, and the ancient equivalent of a bustle (fr. 18). Men who frittered their money away on prostitutes or fought over them in the street also attracted criticism. Yet in pre-Christian Hellenic society it was not unacceptable for men to patronize prostitutes, who were regarded as a cure for dangerous desire, nor was the profession the object of religious disapproval; indeed Aphrodite was the tutelary goddess of prostitutes and temple prostitution in her honour is attested for Corinth (Strabo, 8. 6. 20), although this was unusual for Greece. Christianity, however, introduced a radically different slant on sexual continence. Marriage became the only proper outlet for male sexual desire and, indeed, a "defence against desire" (Brown, 1988). Paul advised one Greek community to marry rather than to burn (1 Corinthians 7. 9), while in the 4th century John Chrysostom, hugely influential in the Orthodox Church, envisaged marriage not as a celebration of sexual love but as a method of avoiding fornication (*De Virginitate*, 19. 1. 1–2). One consequence of this was the outlawing of same-sex behaviour between men; an imperial edict of 390 demanded that male prostitutes in Rome should be burnt. Orthodox theology regards desire as the spiritual effect of original sin and the Church still censures fornication and male homosexual acts.

Another effect of Christian teaching was the shifting of anxiety and blame concerning male desire on to female prostitutes. For medieval society all women were potential Eves, the embodiment of lust, but the prostitute represented the epitome of sexual temptation, the ruination of married men and celibate clergy. Religious anxieties about fornication were exacerbated by the large number of prostitutes in medieval society, driven into the sex trade through poverty. One (rather unsuccessful) solution was the attempt to redeem "fallen women", a social programme influenced perhaps by the example of the Magdalene. One ex-prostitute, Martha, sat in a shrine outside Byzantium exhorting women to avoid temptation (for the repentant prostitute theme see Ward, 1987). Attempts were made to redeem prostitutes by placing them in monastic homes, notably by the empress Theodora in the 6th century. From the 9th century this practice was established as law and female sexual subversives (prostitutes and adulteresses) were forced into convents to learn from the example of their betters and perform menial tasks, perhaps more a matter of punishment than salvation. In contrast, prostitution was used as a punishment for one early Christian martyr at least: Irene of Thessalonica was placed in a public brothel by the Roman prefect Dulcitius for her subversive religious behaviour (*Acts of the Christian Martyrs*, 22).

Finally, it is worth noting that in more recent times sex workers have born the brunt of moral panics about sexually transmitted diseases and perceived moral declines. As ever, the prostitute is at the sharp end of society's concerns about sexual

behaviour and her image is a reflection of both cultural anxieties and religious ethics.

Protestantism

On 31 October 1517 Martin Luther's 95 theses ignited the Reformation. While defending his theology at the Disputation of Leipzig (1519) he was surprised to hear that his views resembled those of Jan Hus, who had been burned at the stake by the Council of Constance in 1415. Scholars have debated whether the origins of the Hussite (the *Unitas Fratrum*) opposition in Bohemia and Moravia to the Roman Catholic Church arose from dim memories of the missionary work of the Greek Orthodox brothers Cyril and Methodios. Whatever the truth of that, in 1450 an individual named Constantine Platris Anglikos (probably of Lollard origins) arrived in Constantinople claiming to represent the Hussite Churches and seeking communion between them and the Greek Orthodox Church. With the fall of Constantinople in 1453 nothing came of this proto-Protestant contact with the Greek Church.

Luther himself did not make any direct contacts with the Eastern Orthodox, but in debates with Rome he did cite them as examples of Christians who did not conform with Roman beliefs and practice. A common opposition to the papacy soon led Protestants – Lutheran, Calvinist, and Anglican – to cite the example of eastern Christians and to seek contacts with them. While Luther did not engage in direct talks with the East, others did. His younger protégé Philipp Melanchthon made a Greek translation of the *Augsburg Confession*. This Lutheran summary of beliefs was sent to Constantinople with a request for further contacts. Melanchthon died in 1560 awaiting a reply. Embarrassed by the doctrinal differences, the patriarch had merely ignored the request.

Continual Lutheran requests for closer ecclesiastical relations eventually gained a response when a delegation of Lutheran scholars visited Constantinople in 1573. Unable to avoid the issue, patriarch Jeremias II wrote a point-by-point response to the *Augsburg Confession* explaining Greek agreements and disagreements with its 21 articles. The reply reached Germany in 1576, and further correspondence ensued. While no Lutheran–Orthodox union was achieved, the correspondence between Tübingen and patriarch Jeremias II was the first ecumenical approach by the West to the East.

The second major attempt to link Protestantism with Greek Orthodoxy occurred during the stormy ministry of Cyril I Lukaris, the Calvinist patriarch of Constantinople (1572–1638). Born on Crete, which was controlled by the Venetians at the time, he studied for a while in Venice. Travelling in Europe in the summers, Lukaris may have met Franciscus Portus in Geneva. Portus was a Cretan and a convert to Calvinism, who became the master of the scholarly production of Classical and biblical texts in Greek at Geneva. While serving as patriarch of Alexandria (1602–20), Lukaris was increasingly influenced by Calvinism through contacts with English and Dutch ambassadors and others. He carried on an extensive correspondence with many western Protestants, both Reformed, such as Antoine Léger, a Genevan minister, and Anglicans including archbishop William Laud. When he became patriarch of Constantinople (1621–38), he strove to reform the moral and spiritual conditions in the Church along Calvinist lines.

Lukaris's *Eastern Confession of the Christian Faith* (1629) was published in Geneva. It contains a mild Calvinism in its doctrines regarding scripture, justification, the sacraments, and predestination. Opposition to it was widespread. Lukaris was denounced and forced to resign five times by Greek clerical opponents who were often incited by the Jesuits. However, the sultan continued to restore him to office. He was finally falsely accused of inciting the Cossacks against the Turks and was executed by strangling upon the order of sultan Murad IV. The ecclesiastical opposition to Lukaris's doctrines produced a series of synods that officially repudiated them. A synod in 1638 anathematized both Cyril and the confession attributed to him. The synod of 1642 condemned the confession and Calvinism without mention of Cyril. The Synod of Jerusalem (1672) eliminated Calvinism from the eastern Church. The ultimate effect of Lukaris's ministry was that it forced the wider Greek Church to define itself more carefully in relation to both Latin Catholicism and Protestantism.

The third major attempt to establish ecumenical relations between Greek Orthodoxy and Protestantism was made with Anglicans. Patriarch Lukaris's correspondence with Anglicans led him to send to England the New Testament *Codex Alexandrinus*. He also sent Metrophanes Kritopoulos to study at Oxford and London (1617–24) and other Greeks to study at the request of the English. In the 17th century numerous commercial contacts between the English and Greeks in the eastern Mediterranean encouraged some to believe that closer ties might be possible. Many in England hoped that similarities in liturgy, ordination, sacraments, and views on church–state relations would make full communion possible. Eventually the theological distances proved too great.

In the 19th century Protestant missions, mainly American, became active in the Balkans and Greece, but with little success. Eventually small Protestant churches were established in Greece. At the end of the 20th century the Greek Evangelical Church (30 congregations, Presbyterian in polity) and the Free Evangelical Church (Congregational) were the largest Protestant churches in Greece. Pentecostals, the Church of England, and others had small congregations. Many of the Protestant congregations were composed of expatriates and American military personnel. After 1945 a neo-Pentecostal or charismatic movement spread widely in the Greek Church, growing to several hundred thousand in number.

In the latter half of the 20th century the main vehicle of contact between Greek Orthodoxy and Protestants has been through the ecumenical movement and the World Council of Churches. Mutual understanding has continued to grow, but deep theological differences remain.

Psellos, Michael 1018–after 1081

Statesman, historian, and polymath

Born to a middle-class family in Constantinople in 1018, Psellos was baptized Constantine, but is better known under his monastic name of Michael. Extemely well educated by the scholar and later court rhetorician and bishop John Mauropous, Psellos embarked early upon a career in the civil administration when he was appointed judge of a theme before the age of 20. He was one of a group of young intellectuals (including his friends the future patriarchs Constantine III Leichoudes and John VIII Xiphilinos) who gained some real political power as advisers to Constantine IX Monomachos (1042–55). When, however, the emperor was forced to abandon some of the salutary reforms of the early part of his reign, the group's power rapidly declined. The liberally adaptable Psellos stayed on as long as was possible until he was ultimately forced to take refuge as a monk on Bithynian Mount Olympus in 1054 when the emperor lost his struggle for supremacy with the rigorously rigid patriarch Michael I Keroularios. Nevertheless, Psellos's return and revenge were swift, for in 1058, as chief minister of Isaac I Komnenos, he was given the role of principal prosecutor in the patriarch's trial, although his surviving speech was never delivered owing to Keroularios's sudden death. Upon Isaac's illness in 1059 Psellos ensured his own safety by persuading the emperor to abdicate in favour of Constantine X Doukas. He was, however, never again an important political figure, despite his own

claims and the fact that he became private tutor to the imperial children. He even had to retreat for a second time to a monastery, but this time to one in Constantinople and under his own patronage. After the accession of Michael VII Doukas in 1071 he fades from history. The date of his death is unknown, but some of his works were probably written after 1081 and he may have been still alive in 1095.

When in 1047 Constantine IX opened a law school headed by John Xiphilinos, protests by students of rhetoric that their opportunities to enter the civil service would now be curtailed persuaded the emperor to satisfy their interests as well. Psellos was consequently appointed "consul of the philosophers" (*hypatos ton philosophon*). Although it is unclear precisely what this position entailed, Psellos probably gained supervision of the private schools in the capital and taught rhetoric and philosophy under some form of imperial patronage. He makes many claims for himself as a teacher, most notably that he revived in Byzantium the study of philosophy, and especially of Plato, and introduced the new teaching method of *schedographia* (parsing) that involved the grammatical, stylistic, and historical analysis of a piece of dictation which was either taken from literature or composed for the purpose by the teacher. Psellos boasts that "people tug and pull at me, loving to hear my voice above all others because I know more than everyone else" and that his fame attracted as students Celts, Arabs, Persians, Egyptians, and Ethiopians. Despite a few surviving short addresses to students who did not pay attention, squabbled, or arrived late or not at all because of a shower, we know that he inspired at least one outstanding student, the philosopher John Italos, who succeeded him as "consul of the philosophers".

Psellos's main interest was philosophy, on which he wrote extensively and could rarely keep out of his work, whatever its subject. Despite his proclaimed attachment to Plato, and his genuine familiarity with his works, he frequently sees the philosopher through the medium of Neoplatonism (especially that of Proclus). This accords with his fascination for the occult – magic, alchemy, astrology, and Chaldaean theurgy. Although the treatise *De Operatione Daemonum* (*On the Working of Demons*) is almost certainly spurious, his interest in those subjects as well as his Platonism led to accusations of paganism, which he was more successful in fending off than was his student John Italos. Many of his philosophical works are derivative, especially his commentaries for students on Plato and Aristotle (whom he knew as well as he did Plato), and a collection of miscellaneous learning, often drawn from Plutarch, known as *De Omnifaria Doctrina*. Although he was not as original a thinker as John Italos, some of his works show an independent mind that wedded theology with philosophy and science in positing a divinely created *physis* (Nature) that works in accordance with immanent laws.

Psellos's chief claim to fame today, however, is as a historian. Although he wrote, probably in his youth, a brief traditional and only recently discovered chronicle, this claim rests on his *Chronographia*, an account of the reigns of 14 emperors from 976 to 1078. The *Chronographia* is a revolutionary piece of historiography based largely on his own observations. It is largely a series of often subtle and perceptive psychological studies of character, which are never stereotypical but frequently both complex and fluid. In denying providential causation Psellos attributes events to personal emotions and ambitions which he explores at length, and he presents his material in such a way that the reader gains vivid pictures of an unfolding drama. His reliability as a historian is generally admitted, but with the reservations that he is aware of little of what happened outside the capital, has sparse military interest, and exaggerates his own role in events (the most extreme example of egocentricity is his rewriting of the *Life* of St Auxentios to include details of his own biography). Although the *Chronographia* is idiosyncratic and inimitable and was not widely read, at least after its author's death, it expanded the horizons of subsequent Byzantine historiography, most notably in the works of Anna Komnene and Niketas Choniates.

Psellos's oratorical style was modelled especially on Plato, Aelius Aristides, and Gregory of Nazianzus. Among his surviving speeches are many addresses to the reigning emperors, for whom he also wrote speeches for them to deliver themselves, and a number of masterly funeral orations. Two of these, for his mother and his young daughter, are notable for his deep affection, which comes through also in many of his more than 500 letters and a touching little essay addressed to his infant grandson.

Literary interests are shown in many works: essays on the styles of the Church Fathers John Chrysostom, Basil of Caesarea, Gregory of Nazianzus, and Gregory of Nyssa, whom he compares with writers of the Classical period and the Second Sophistic; comparisons between the novelists Heliodorus and Achilles Tatius, and between Euripides and George of Pisidia; allegorical interpretations of Homer; explanations of contemporary phrases; occasional literary essays often of a humorous or satirical nature; and poems (37 genuine ones survive) on a variety of topics and which range in length from 2 to more than 1400 lines. Linguistic studies are further seen in essays on etymologies and grammar. Numerous other treatises attest to his interest in jurisprudence, mathematics, medicine, mathematics, music, geography, etc. On the practical side he asserts that he experimented with mechanical devices described by the ancient inventor Heron of Alexandria, and in an encomium on wine claims that he successfully extracted a friend's tooth.

Unfortunately some of Psellos's works still remain unpublished and many are available only in poorly edited form in widely scattered books and periodicals. To remedy this situation, since 1985 the German publishing house of B.G. Teubner has been issuing a series of newly edited volumes in a uniform scholarly edition. Very little has been translated into any modern language. Nevertheless, enough is known of Psellos to call him the "Cicero of Byzantium" in his combination of a political life with one as an intellectual and writer; but the range of his interests was far more extensive than the Roman's.

Psycharis, Yannis 1854–1929

Philologist

Yannis Psycharis is one of the most important figures of Greece's intellectual history. His influence, which was radical and fundamental, concerns mainly the direction of the development of the Greek language. He entered Greece's intellectual history at a time when the young Greek nation was searching for its identity and when it was deeply divided on the question of which language form should be the official one. The options were (1) a more archaic Greek aspiring to restore the Attic, (2) the demotic, i.e. the common language of the people, and (3) katharevousa ("purified") an artificial compromise solution advocated by Adamatios Korais. From his first publication, *Études de philologie néo-hellénique* (1885), and for the rest of his life, Psycharis became the most dynamic and persuasive supporter of the demotic.

From early childhood Psycharis was exposed to a number of different languages: the demotic Greek from his grandmother and the servants, Italian from friends, French from his family and from the schools in Paris, and later German. He also studied ancient Greek and Latin as well as the katharevousa. This rich language experience made Psycharis linguistically sensitive and gave him a better perspective. He studied historical and comparative linguistics at the universities of Paris and Bonn (in spite of the fact that his father sent him to Bonn in order to study law), when the predominant linguistic theory was that of the Neogrammarians. This theory demonstrates scientifically that language change is not degeneration caused by ignorance, but rather a natural development brought about by natural phonetic laws supplemented by analogy and borrowing. His teachers were the eminent linguists Michel Breal, Arsène Damsteter, Louis Havet, Gaston Paris, and Émile Legrand. He also attended lectures given by the founder of structural linguistics, Ferdinand de Saussure, while his philosophical views were shaped by his father-in-law Ernest Renan, and by the European positivist Hippolyte Taine. Taine and especially Renan encouraged Psycharis to direct his studies to the Greek language to which Psycharis turned decidedly in 1885. Psycharis was also influenced by his friend, the great literary figure Victor Hugo, and was inspired by the work of Dante. Psycharis had a very successful career as professor of Modern Greek at the École des Langues Orientales of the Sorbonne after succeeding Legrand. He held this chair until his death in 1929 when he was succeeded by another important Hellenist, André Mirambel.

Psycharis was a complex, passionate, and ambitious personality. He was both French and Greek, but with his native Greek side stronger than the French. He was also a scientist with literary aspirations. His work consists of an impressive number of scientific analyses of the Greek language and its dialects as well as of poetry, short stories, and a novel.

Given his background and his temperament it is not surprising that Psycharis entered the linguistic battle of Greece on the side of the demotic. Of his works the one which had the greatest impact was *To Taxidi Mou* ("My Journey", 1888), which is a novel, a travelogue, a philosophical treaty, and most importantly a linguistic manifesto. In it Psycharis expresses most clearly the arguments in support of the demotic and the charges against katharevousa. The book also contains extremely lyrical sections on love as well as insightful comments on historical and current figures from the Greek intellectual scene, but most importantly it constitutes the first attempt to use the demotic in prose. This step was very daring because, in spite of the fact that the demotic had made inroads into poetry (the Ionian school earlier with its major representative Dionysios Solomos and the Athenian school during Psycharis's time with Kostis Palamas and Angelos Sikelianos), prose writers hesitated to use it. Even demoticists such as Emmanouil Roidis, who had advanced important scientific

arguments for the demotic in his book *Ta Eidola* ("The Idols"), refrain from using it in their work. Thus *To Taxidi Mou* becomes a major turning point in Greece's literary development.

Psycharis's work and views on language met with a great deal of hostility in Greece. One of his critics was the linguist and first occupant of the chair of linguistics in Athens, George Chadzidakis, who, in spite of his early positive views on the demotic and his extensive studies of it, came to embrace katharevousa on the grounds that the demotic lacked a systematic grammar and richness of its vocabulary. Psycharis was also criticized for his extreme views on which forms should be considered licit in the modern Greek language. Because he believed that a language must operate on a pure system and that the only natural and thus legitimate system is that of the demotic on the grounds that it has emerged from the ancient language via natural diachronic phonetic laws, he proposed that katharevousa words which had entered the common language in their archaic morphology should be modified so as to follow the demotic rules. This purification programme in the direction of the demotic went against the sensibilities of most Greeks and Psycharis was attacked from many quarters. His supporters, who were referred to as *malliari* ("the hairy ones"), were ridiculed by attributing to them gross hyperdemoticisms. However, Psycharis also inspired a number of significant literary figures, the most important of whom was the highly respected poet Palamas, the leader of the Athens school of intellectuals whose demoticism found in Psycharis strong scientific support. Nikos Kazantzakis, later on, also considered Psycharis as his inspiration and his mentor on language matters.

Psycharis may not have been the only person to argue the case for the demotic. Indeed, Psycharis's arguments can be found almost intact in Solomos 50 years earlier. Nevertheless, Psycharis was the first to provide the demotic with a persuasive scientific basis and to demonstrate by his novel *To Taxidi Mou* that the demotic can be used in all forms of discourse.

Born in 1854 to a Greek family from Chios, Psycharis studied linguistics at the universities of Paris and Bonn and lived mostly in Paris where he became professor of Modern Greek at the Sorbonne. His chief contribution was to support demotic in the language question; but he also wrote poetry, short stories, and a novel. He died in 1929.

Ptolemies

Greek rulers of Egypt

The Ptolemies, Greek kings of Egypt, formed a dynasty that ruled the country from 305 BC to 30 BC. The Ptolemaic dynasty takes its name from the first such king, Ptolemy the son of Lagus, a Macedonian childhood friend and later general of Alexander the Great. Alexander conquered Egypt (then part of the Persian empire, which he set out to destroy) in 332 BC, during the early stages of his great expedition to the east. While in the country, he founded the city of Alexandria on the western branch of the Nile delta on the coast of the Mediterranean Sea. As Alexander passed on, the city was left in the hands of an architect and a financial administrator and it appears to have functioned as a Greek city from early on. It later became the royal capital of the Ptolemies, and among the greatest cities of the ancient world.

When Alexander died in 323 BC, his empire was divided for purposes of administration among his generals; Egypt passed into the control of this same Ptolemy, first as satrap (the Persian term for a provincial governor) and then as king. Ptolemy ousted the financial administrator Cleomenes, and finally had him killed for peculation in the grain trade. The country remained firmly under Ptolemy's control throughout the power struggles that took place among Alexander's successors during the next 20 years. Generally he concentrated on consolidating his power in Egypt, eschewing the territorial ambitions of his fellow successors in Asia and Greece. In 305 BC Ptolemy declared himself king, as did other successors in their own territories.

Ptolemy I Soter ("Saviour", an epithet he received after helping the island of Rhodes during a siege) established a secure kingdom, which for the next three centuries was to be ruled by his direct descendants. A mark of his political acumen was the fact that he was the only one of Alexander's successors not to die a violent death in battle. Greek civilization and culture came to Egypt, and settlers from Greece and Macedonia were actively encouraged. Alexandria and other cities in Egypt grew with the influx of the new ruling class. Certainly it can be maintained that a veneer of the Greek way of life was imposed on the native civilization of Egypt. To Ptolemy I's early patronage can probably be attributed the foundation of the famous library of Alexandria, in which the works of Greek literature were codified, copied, studied, and therefore preserved for posterity. Attached to the library was the museum ("Shrine of the Muses", the patronesses of intellectual arts), a residential study facility which attracted the finest Greek scholars and writers of their day. Alexandria became the capital of Greek culture, overtaking Athens as its centre.

Ptolemy I made his son co-regent in 285 BC, and the latter on his father's death in 283 became Ptolemy II (later to receive the cult title Philadelphus, "sister-loving"). During his long reign Ptolemy II presided over the growth of Alexandria into a famous and rich capital. The library and museum flourished, the wealth of Alexandria and its kings became proverbial among contemporary writers, and Ptolemy II amassed the greatest navy ever known in the Greek world. The largest political clouds on the horizon were Egypt's constant dispute with

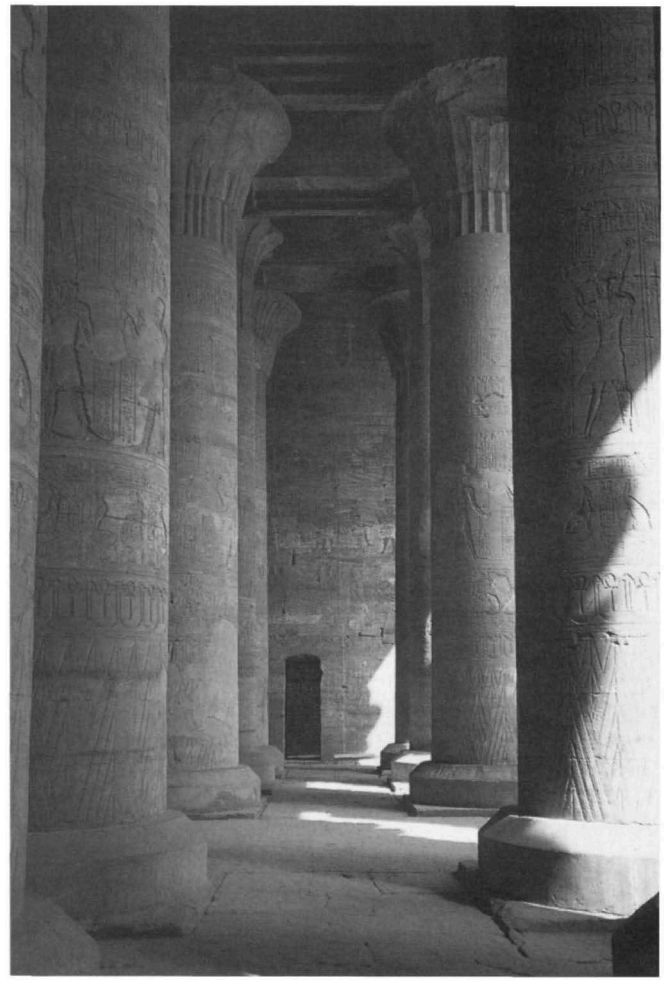
the Seleucid kings over Coele ("Hollow") Syria, the area known as the Middle East today. Two wars were fought over this territory in Ptolemy II's reign. In the mid-270s BC Ptolemy married his full sister Arsinoe (known as Arsinoe II Philadelphus), a clever woman who abetted his political schemes. This established the custom of royal brother–sister marriage in Ptolemaic Egypt, although at the time the Greeks were scandalized at the notion of incest.

Ptolemy III, known as Euergetes ("Benefactor"), succeeded his father in 246 BC. His reign is best known for the Third Syrian War, in which he invaded the Seleucid Syrian empire to support the claims of his sister Berenice Syra ("the Syrian") as queen to the Seleucid throne. (The Greek poet Callimachus wrote a poem called "The Lock of Berenice" to describe the dedication of a lock of hair by Ptolemy's queen, also named Berenice, to ensure his safe return from the war. The lock was, according to the poem, apotheosized into a constellation and subsequently spotted in the heavens. Although only fragments now remain of Callimachus' poem, it was translated into Latin by the Roman poet Catullus and is one of the most famous ancient poems.) The sister Berenice Syra had already been murdered when Ptolemy arrived. Although he captured some important cities in Asia Minor, this appears to have been the limit of Ptolemaic expansion.

So far the 3rd-century Ptolemaic empire had been characterized by good kings and stable government. With the accession of Ptolemy IV Philopator ("Father-loving") in 221 BC, the situation changed. Ptolemy IV's predilections were more for intellectual and dilettante pursuits than for politics, and he succumbed to the control of unscrupulous ministers. Although he won a great victory in the Fourth Syrian War at the Battle of Raphia in 217 BC, he failed to press for any concessions in the peace treaty. After Raphia, Egypt was shaken by severe internal revolts, and in 206 BC by the secession of Upper Egypt for 20 years. The lack of any positive foreign policy continued, and Ptolemy IV and his sister-wife were eventually murdered by his ministers in 205 BC, their deaths being kept secret for some time.

Ptolemy V Epiphanes ("Made Manifest") acceded to the throne as a child following his father's murder. Other Greek Hellenistic kingdoms unsuccessfully colluded to divide Egypt between them. The end of the Fifth Syrian War brought him a wife of the Seleucid house, the first of the Ptolemaic queens to be called Cleopatra. Ptolemy V was crowned in traditional Egyptian fashion at the old dynastic capital Memphis, south of Cairo. He was the first of the Ptolemies to be crowned pharaoh, although all had been depicted in native dress in statues and temple reliefs. The priestly decree of 196 BC which followed his coronation is the famous trilingual Rosetta Stone (now in the British Museum) written in outmoded Egyptian hieroglyphics, current Egyptian demotic, and Greek. The Greek part of the Rosetta decree enabled translators for the first time to decipher Egyptian hieroglyphics, one of the most important advances ever made in latterday understanding of ancient Mediterranean history.

Ptolemaic Egypt of the 2nd century BC was a fundamentally different world from that of the 3rd century BC. All the Hellenistic Greek empires were affected by the growing power of Rome and its increasing interest in the Greek east, and Egypt was no exception. Beginning with Ptolemy VI (a child king like his father), who acceded to the throne in 180 BC, successive Ptolemies warred among themselves and collateral relatives, reunited, ruled jointly, and fell out again. The practice of incestuous marriage between siblings may have had adverse genetic effects over generations. Fraternal civil wars, exile, incest, murder, and even matricide are well-documented features of Egypt in the 2nd century BC. A prime example of the rulers of this period is Ptolemy VIII Euergetes II, also called Physkon ("Potbelly"). He succeeded his brother Ptolemy VI, killed his nephew Ptolemy VII (the son of his brother Ptolemy VI and sister), married Ptolemy VI's widow, who was also his own full sister, and concurrently married the daughter of his brother and sister (his double niece). He produced children by both wives, and also an illegitimate son. It is almost inconceivable to imagine how this complex marital situation functioned, with a man married at the same time to both his sister and her daughter, but inscriptions attest to a triple joint rule for at least some of the period, although civil war did break out intermittently.



Ptolemies: hypostyle hall, nucleus of the temple of Horus begun in the reign of Ptolemy III at Edfu, Egypt

After Ptolemy VIII the situation did not improve. Quarrelling brothers found that the temptation to invoke Rome to support their side against their rival proved too difficult to resist. No strong king emerged to bring the matter under control, and the Alexandrian populace, increasingly

disgusted with the dynastic debacle, seized power. Finally, in the early 1st century BC either Ptolemy X or Ptolemy XI bequeathed the kingdom of Egypt to Rome, ensuring that the last half-century of Ptolemaic rule was inextricably entwined with the history of Rome.

The legitimate line of the Ptolemies died out with the deaths of Ptolemy IX, X, and XI. Ptolemy XI was actually established on the throne by the Roman dictator Sulla in 80 BC, but he soon murdered his stepmother (to whom he was then married), and was in turn himself murdered by the Alexandrian mob, who resented Rome's interference in their country as well as the murder of their queen. The succession passed to the illegitimate son of Ptolemy IX, who became Ptolemy XII, known as "Auletes" ("Flute player", indicating his frivolous tendencies). Auletes and his sister-wife Cleopatra V probably had six children together, among them the girl destined to become Cleopatra VII, the last Ptolemaic ruler of Egypt.

Far from secure on his throne, Ptolemy XII depended on the firm support of Rome. In 59 BC he paid a huge sum of money to be formally declared a friend and ally of Rome, but the wrath of the Alexandrian mob drove him into exile in 58 BC. Auletes fled to Rome to the protection of Pompey, one of the triumvirs (three generals who jointly ruled in Rome), and then to the city of Ephesus in Asia Minor. The two eldest daughters of Auletes appear to have ruled Egypt in his absence; one soon died, but the marriage of the other to the alleged son of Rome's Parthian enemy Mithradates VI caused consternation in Rome. From a Roman point of view, Ptolemy XII seemed preferable to his maverick second daughter; in 55 BC, with the help of Roman troops, he was escorted back to Egypt by Aulus Gabinius, the Roman governor of Syria, and reinstated on the throne. He had his second eldest daughter killed, and ruled until his death in 51 BC.

The eldest surviving child of Auletes was now Cleopatra, who was declared queen and who as Cleopatra VII Philopator ruled jointly with her younger brother Ptolemy XIII (then no more than a boy), whom she married in accordance with Ptolemaic custom. Ambitious ministers contrived to control the boy king and divide him from his sister, who even as a girl of 18 was showing signs of political cunning. Cleopatra was forced to flee Egypt. She then became involved in the consequences of the civil war between Pompey and his rival Julius Caesar. Caesar came to Egypt in pursuit of Pompey, and decided to support the claims of Cleopatra against her brother. The so-called Alexandrian War of 48–47 BC ensued in which Caesar and Cleopatra were victorious, and Ptolemy XIII killed. Cleopatra was reinstated on her throne by Caesar and married her younger brother Ptolemy XIV, ostensibly ruling jointly with him.

A legendary Nile cruise was then enjoyed by Cleopatra and Caesar, a married man some decades older than the queen. When he left Alexandria she was pregnant, and bore a son (probably Caesar's child) named Caesarion. Cleopatra spent the years 46–44 BC in Rome with Caesar and their son, but had no option but to return to Egypt after his assassination in 44 BC. Caesar's supporter Mark Antony and adopted son Octavian (later to become the Roman emperor Augustus) initially joined forces to defeat Caesar's assassins, but Antony and Octavian later became rivals for ultimate power in Rome. Antony's agreed control of the eastern part of Roman territory set the stage for Cleopatra's cataclysmic meeting with him in 41 BC, when he summoned her to meet him at Tarsus in Cilicia.

For 11 years Cleopatra was intermittently associated with Antony (who at the time was married to a succession of Roman women including, finally, Octavian's half-sister), and she bore him three children. Antony's political differences with Octavian, his liaison with a foreign queen deemed dangerous by the Romans, and Antony's and Cleopatra's apparent dynastic ambitions for their children meant that war was inevitable. Rome declared war upon Egypt. At the battle of Actium in 31 BC the combined forces of Antony and Cleopatra were defeated by Octavian, who pursued the couple back to Alexandria. With defeat now inescapable, Antony committed suicide, followed by Cleopatra some days later.

With the death of Cleopatra the Ptolemaic dynasty ended (her son Caesarion was killed, and the fates of her two sons by Antony are unknown). Egypt lost its independence and became a province of Rome until its conquest by the Arabs in AD 642. Despite the gradual decline of the Ptolemies from their glorious beginning in the 3rd century BC through to the petty internecine squabbles of the 1st century BC, Ptolemaic Egypt remained independent from Roman control longer than the other Hellenistic empires. The upper echelons of Greek society made it a Greek kingdom which can be credited with the creation, preservation, and transmission of Greek culture and ways of life.

Ptolemy

Astronomer and geographer of the 2nd century AD

Claudius Ptolemaeus (more usually known to English-speakers as Ptolemy) worked in Alexandria, and the astronomical observations he records suggest that he was active in the middle of the 2nd century AD. We know virtually nothing else about him.

Ptolemy's principal astronomical work, the *Mathematike Syntaxis* (Mathematical Treatise), is usually known in the modern world as the *Almagest*, which is derived from the Greek *megiste* ("greatest") with the Arabic definite article added to it, a name that bears witness both to the dominant position the *Almagest* established in ancient astronomy, and to its influence on later astronomers. The *Almagest* is the culmination of the attempts of Greek astronomers to create a mathematical model that would account for and predict the observed movements of the heavenly bodies (the fixed stars, the sun, the moon, and the five known planets), on the basis of regular movements in circles and taking the earth as the fixed point. This is indeed mathematically possible, but, looked at on this basis, the movements are very complex, and incorporate many very small variations, so that the weaknesses of any particular model might become apparent only when errors had accumulated over centuries of observation. Ptolemy's great achievement was to devise a model that not only produced a very close match to what was observed, but was also capable of modification and could be refined as new inconsistencies were identified. For this reason it was not seriously challenged for 1300 years; it was only in the 16th century that it was realized that the mathematics could be simplified enormously by taking the sun as the fixed point and having the earth as well as the planets move round it in orbits which were elliptical, not circular. Ptolemy builds principally on the work of Hipparchus, active some three centuries earlier, and uses the epicycles (orbits around the circumference of a circle whose centre is itself moving round the circumference of another circle) and eccentric circles (circles whose centre is not the sun) that were the basis of Hipparchus' system. Book 1 incorporates a Table of Chords which is in fact the equivalent of a modern sine table, and reveals considerable knowledge of trigonometry; Ptolemy certainly did not invent trigonometry (for it had already been used by Hipparchus), but his full and clear exposition of its principles is one of the foundations of the modern development of the subject. Book 2 deals with the geometry of the heavenly sphere; book 3 is on the sun; books 4 and 5 are on the moon; book 6 discusses eclipses; books 7 and 8 are on the fixed stars, and include a catalogue of stars; the rest of the work (books 9–13) deals with the complex problems of the movements of the planets. It is difficult to be sure which elements of the system described in the *Almagest* are Ptolemy's own, and which are derived from his predecessors (and indeed many of the observational data he uses must have come from earlier astronomers). It is, however, the sophistication and adaptability of the system that guaranteed that it would dominate subsequent astronomical thought, and for this Ptolemy can clearly claim the credit.

Almost as important and influential is his other main work, the *Geography*, an attempt to systematize and map everything known about the world at the time. We cannot tell whether Ptolemy himself ever produced such a map (the maps that are found in surviving manuscripts are certainly derived from Byzantine originals), but the material in the *Geography* is presented in such a way that drawing a map from it would be relatively easy. Ptolemy had predecessors in this (he himself acknowledges his dependence on Marinus of Tyre, who is otherwise unknown), but it is likely that the use of lines of latitude and longitude to define positions on the earth's surface may be Ptolemy's own original contribution. Impressive though the mathematical and geographical concepts in the work are, the factual basis on which the *Geography* rests was inadequate (and could hardly be otherwise, since for most of his information Ptolemy would have been dependent on the reports of others, and sometimes he would have had nothing to use but travellers' tales). Within the Roman empire his information is reasonably accurate, but further afield it is completely unreliable. Errors in some of the astronomical data on which he relies (observations of the time at which eclipses were observable in different places, for example) inevitably produce distortions. Nevertheless it was not until the 16th century that it was entirely superseded.

Less well known in the modern world, but almost as influential, was Ptolemy's *Harmonics*, which built on the work of Aristoxenus, and is most notable for the balance it strikes between empirical and mathematical approaches. It is an invaluable source of information on the views of earlier writers, and on ancient musical practice, and had great influence on the theory of music in the Middle Ages (through Boethius) and in the Renaissance.

Among Ptolemy's others works are: the *Tetrabiblos* (so called because it is in four books), an astrological work based on the principles of the *Almagest* and perhaps an attempt to put astrology on a scientific footing; the *Optics* in five books (surviving only in part, in a Latin version of an Arabic translation) which deals with reflection and refraction, and represents a substantial advance on Euclid's *Optics*; the *Planispherium* (surviving in Arabic and Latin translations) dealing with the geometry of the celestial sphere and in particular the system of stereographic projection of the heavenly sphere on to the plane of the equator; the *Analemma* (surviving only in Latin translation, with some fragments in Greek) on the orthogonal projection of the sphere on to a single plane; and the *Phaseis Aplanon Asteron* (of which only the second book survives) on the weather associated with the heliacal risings and settings of prominent stars. He is also said to have written a rather unimpressive minor philosophical work, *On the Criterion and the Ruling Faculty*. Proclus tells us that he tried to prove Euclid's controversial parallel postulate (Postulate 5) and gives us excerpts from the proof. Ptolemy is also credited with works on dimensions and on mechanical problems.

Summary

Ptolemy (Claudius Ptolemaeus) lived in Alexandria in the 2nd century AD but nothing else is known of his life. He wrote on astronomy (the *Almagest*), on geography, and on music (the *Harmonics*), and a variety of other subjects. His astronomical work went unchallenged until the 16th century.

Purple

In ancient Greece the colour purple was an emblem of conspicuous consumption, a symbol of wealth and prestige. The most favoured dye was extracted from shellfish found in the Mediterranean, a process that was developed in the Near East by the Phoenicians around 1400 BC. They searched every coast known to them – from the Sea of Marmara to Asia Minor, from Greece to southern Italy, from Lebanon to north Africa – for murex shellfish, establishing factories and trade centres. Common species producing sea purple were *Murex trunculus*, with a blue-purple hue, and *Murex brandaris*, known to the Venetians as Turk's Blood because of its dark red stain. Producing purple was a painstaking and costly process despite cheap labour. Enormous quantities of the molluscs were needed for the potent colourfast pigment, which was extracted from the mucus glands of freshly killed sea snails. They yielded an almost black liquid called *anthos* (blossom) by Greek dye workers. Exposure to air and sunlight developed the purple hue. Modern experiments using 12,000 *Murex brandaris* and a high extraction technique have yielded 1.5 g of dye. Though it is difficult to equate ancient costs with modern currencies, the price of sea purple in Greece around 200 BC might be estimated at $28,000 a kilo. Dye workshops, with their spoil heaps of discarded shell fragments and bits of decaying shellfish, were neither clean nor savoury places of employment. The Greek geographer Strabo said that the Phoenician dye centres of Tyre and Sidon were so putrid that they were "unpleasant for residence". One could easily identify dye workers by their brightly coloured hands and arms as well as the smell that clung to their bodies and clothing.

The demand for purple exceeded its supply and in the ancient world cheaper and more plentiful substitutes were developed by diluting the true organic dye with water, urine, or honey, or by using animal or vegetable material that approximated to the desired colour. One such source came from the kermes insect called *coccus ilicis* which produced a colour between blue and red. There were industries devoted to the production of counterfeit purple from cheap materials such as mulberry juice, amaranth blossoms, and crushed bloodstone. Papyrus fragments found in Egypt containing dyeing recipes are based on four books attributed to the Greek philosopher Democritus, who reportedly dabbled in alchemy, converting substances that yielded the desired colour and lustre to textiles that would fool even connoisseurs of the coveted hue.

Ancient historians and poets wrote about purple textiles and their production. The most famous dye centre in Greece was at Hermione in Argolis; its textiles were in demand throughout the Mediterranean and coveted by the Persian court. Robes made at Hermione were entirely purple with a broad vertical white stripe. In Thessaly the workshops of Meliboea were praised by ancient writers for the quality of the dyes produced there. The town of Bulis in the Gulf of Corinth engaged more than half the population in harvesting and processing the molluscs. Spartan law prohibited dyers from the region as falsifiers of nature. Yet, with time, Pliny claimed that the shellfish along the Laconian coast and on the island of Cythera provided the best purple dye in the world. The islands of Euboea, Chios, Rhodes, Cos, and Cyprus yielded an excellent quality of purple. In the west the cities of Syracuse and Tarentum were also noted for their purple dye centres. In fact, a hill in Tarentum named Mount Testaccio is made up entirely of broken murex shells, both the *trunculus* and *brandaris* types.

The *Iliad* makes numerous references to garments of purple worn by kings and generals. In the *Odyssey* the hero Odysseus is given a cloak dyed sea purple by his wife, Penelope. Purple robes were deemed worthy offerings to Apollo at Delphi by king Croesus of Lydia, according to Herodotus. The poetry of Sappho relates the high esteem of purple garments as gifts for gods and goddesses. Greek lyric poets of the 5th century BC equated purple with the garments of heroes and gods. Parrhasius of Ephesus was notorious for his luxurious tastes including a purple cloak, which was considered to be well above his status as a painter. Plato, one of the Athenian moral majority, considered purple to be a decadent emblem of wealth and an effeminate article of clothing. However, despite the conservative views of Athenian philosophers, by the 4th century BC the use of purple was fairly widespread in Greece.

What had previously been a mark of Persian tyranny and decadence was transformed by Alexander's defeat of Darius in 330 BC into an accepted status symbol, when he exchanged his white Macedonian robes for the coloured trappings of royalty brought to the Mediterranean world by Phoenician tradesmen.

The Greeks did not associate the colour purple with the same mystical qualities as it enjoyed in the Near East. However, they too dressed their deities in purple and the ancient association of the colour with war persisted. Its psychological and aesthetic peculiarities were of the utmost importance. Greek generals wore purple and its significance was promoted in the dress of singers at festivals in honour of the gods. In the Classical and Hellenistic periods purple enjoyed a sacrosanct and noble status, adorning distinguished people. It was common, therefore, for great statesmen, actors, courtesans, and wealthy citizens to wear purple as a rather blatant show of power and status. A 4th-century BC grave of a woman in south Russia yielded some purple cloth that was painted on with a brush. The colour was frequently used as paint, rather than as a dye, and was also employed as a cosmetic.

The Romans, like the Macedonians, originally wore white or natural-coloured garments. However, over the course of time certain robes became associated with specific officials or priests for wear on festivals and other sacred occasions. One of these was the purple pallium of the priesthood. An old Roman family, named after Furius Purpureo, had the purpura shellfish as its insignia. Centres of international trade included the dye workshops of Greece, which were especially important in promoting a desire for the exotic and expensive colour. The first official documented to have worn a purple robe was an aedile named P. Lentulus in 63 BC. Purple stripes were worn on the togas of officials and eventually became the privilege of senators. As the colour became more popular, the purple trade flourished in Rome and dealt in many items, mainly textiles but also leather, ivory, pottery, marble, and stone. Porphyry, a deep purple stone imported from Egypt, was used as the material for sarcophagi for the royal family of Constantine the Great and for statuary of the Tetrarchs, to name a few examples.

In AD 383 an imperial decree was issued establishing a monopoly on the most costly purple dyes known as *blatta*. Only the emperor could wear robes dyed with the colour; private individuals who ignored the new law were charged with treason. Several late antique tombs, one from a necropolis near Nero's Circus in Rome and another from a Palmyrene tomb in Syria, have yielded shrouds and other garments woven in purple and gold threads. Entire garments have been preserved in the hot, dry climate of Egypt, in graves from the Fayum and Panopolis dating from the 3rd to the 8th centuries AD. Though Christianity had been established for centuries, the embroidered and painted scenes are direct quotations from the mythology of ancient Greece and Rome. According to modern research the colours were based on imitation purple extracts rather than genuine sea purple dyes.

During the Byzantine period the colour purple underwent a tremendous rise in prestige. The offspring of Byzantine emperors were born in the palace at Constantinople in a purple room that was swathed in purple drapes and were wrapped in purple swaddling clothes. The title *Porphyrogennetos* was added to the name of those born in this manner. Mosaics at San Vitale in Ravenna reveal the emperor Justinian and the empress Theodora with their respective attendants wearing gold-embroidered purple robes. Yet the tradition was not completely lost. The 6th-century Codex Porphyrius at Patmos with 33 purple parchment pages illuminated with silver and gold script can still be seen. Wilfred of Ripon, a late 7th-century Church Father, commissioned the four gospels on purple-dyed parchment. His altar at Ripon Minster in England was decorated in purple interwoven with gold thread, a custom that persisted in the medieval period for sacred purposes just as it had in antiquity. The crusaders were credited with bringing back to England some of the ancient art.

With the fall of Constantinople to the Turks in 1453 purple commerce ended and the secrets of its manufacture were lost until modern times. Pope Paul II permitted his cardinals to wear scarlet made with the kermes insect for their vestments, which was a great deal less expensive than true sea purple. The secret of the ancient craft was rediscovered in 1858 by a French zoologist named Henri Lacaze-Duthiers who was studying animal life in the Mediterranean. He noted that fishermen stained their clothing with the juice of a shellfish, initially yellow in colour, which turned a brilliant and colour-fast purple upon exposure to the sunlight. Earlier scholars had inquired into the problem of purple production based on the writings of Pliny and Aristotle but it took a scientific mind to correlate the methodology with the philology for a reproducible result. The chemical composition of purple was discovered in 1909 by Paul Friedlander of Vienna and since that time it has been possible to produce purple synthetically.

Purple still maintains its association as a colour used by priests and leaders of the Orthodox Church in Greece and other areas particularly during Lent, Advent, and other periods of preparation and mourning. Purple today is also identified with healing, fantasy, insanity, and passion throughout the western world.

Pydna

City in Macedonia

Pydna was a Greek city founded on the east coast of Pierian Macedonia on the Thermaic Gulf in the 7th–6th centuries BC. An acropolis site on the coast south of the modern village of Makriyialos is now thought to have been its original location. The city played an occasional role in political events in Greece in the 5th and 4th centuries BC, and, as such, is attested by Greek historians of the period. The 5th-century king Alexander I of Macedonia was known as the "Philhellene", but his interests inevitably clashed with those of Athens in northeastern Greece. When the Athenian general Themistocles fell out of favour and fled from Athens, he was given refuge at Pydna by Alexander in the early 460s BC before escaping to Asia. In the build-up to the Peloponnesian War and the revolt of Potidaea in 432 BC, Athens briefly besieged Pydna, hoping to establish a base there for operations in the north.

In 410 BC the Macedonian king Archelaus I captured Pydna and refounded the city as a Macedonian town some distance inland to the northwest, probably to guard it from attack from the sea. This was the site of Macedonian and Roman Pydna, near the modern village of Alonia. The inland site continued to be inhabited after the coastal site was reoccupied after Archelaus' death in 399 BC. In the late 360s BC, during the establishment of the Second Athenian Confederacy, Pydna was among the cities seized by the Athenian general Timotheus to provide bases against Macedon and Chalcidice, but the Macedonian king Philip II, in the course of his campaign to subdue Greece, captured Pydna, probably in 357 BC, along with other Greek cities along the Macedonian coast. Pydna was treated harshly and garrisoned.

At the end of the 4th century BC Pydna briefly took centre stage in the violent political struggles that followed the death of Alexander the Great. Alexander's Epirot mother, queen Olympias (the first wife of king Philip II of Macedon), was a formidable woman and a dangerous opponent. She championed the claim to the Macedonian throne of her grandson, Alexander's posthumous child, and, to this end, engineered the deaths of the rival claimant Philip III Arrhidaeus (an illegitimate son of Philip II) and his powerful wife Eurydice. She thereby incurred the fury of Cassander, the son of the old regent Antipater, who had supported Philip III as the legitimate king. In the face of Cassander and a large army, in 317 BC Olympias and her royal retinue went to Pydna, whereupon the town was besieged by land and sea. Relieving forces from outside were persuaded to abandon Olympias, and many inside Pydna deserted to Cassander when a grievous famine incapacitated the besieged. In the spring of 316 BC Olympias surrendered to Cassander and was condemned to death in absentia by the general assembly of the Macedonians. Although she refused proffered exile, and Cassander's troops were too awestruck to kill her as ordered, Olympias was eventually murdered at Pydna by the relatives of some of her past victims. (The story of the siege of Pydna and the death of Olympias is told in Diodorus Siculus, 19. 35–36, 49–51.)

Three important inscriptions of a later date were found in the vicinity of Pydna which refer to the tomb of Olympias and the nearby burial of descendants of the Aeacidae, the royal house of Epirus to which Olympias herself belonged. These texts indicate, surprisingly, that members of this family were living at Pydna in the 2nd century BC after the Roman conquest of Macedonia (see below), and that the tomb of Olympias was revered. Pydna therefore occupies a complex place in the Hellenic tradition: on the one hand, it witnessed the first of many brutal deaths of Alexander the Great's immediate family, but, on the other, it sheltered Alexander's maternal Epirot descendants long after the Antigonid dynasty of Macedonian kings had been destroyed by Rome.

The tomb of Olympias has never been found, and a suitable historical context for its construction can only be surmised, but burials in typical Macedonian chamber tombs are known from this area (for example the so-called Tomb of Pydna, an elaborate multiroomed chamber tomb probably dating from the end of the 3rd to the beginning of the 2nd century BC).

Pydna is best known as the site of the great battle between the forces of the Macedonian king Perseus (son of Philip V) and the Roman general Lucius Aemilius Paullus in June 168 BC. The decisive Roman victory, in which some 20,000 Macedonians were killed and some 11,000 taken prisoner, brought to an end the Third Macedonian War and had catastrophic consequences for the future of Macedonia and northern Greece. Perseus and his family were eventually captured and sent to Rome. The king marched in chains in Paullus' triumph and died soon after in captivity, thus ending the Antigonid dynasty of Macedonian kings. The vast wealth of Macedonia, especially the royal palace at Pella, was plundered and taken to Rome to be paraded in the three-day triumph (see Plutarch's *Life of Aemilius Paullus*, 30–35, for an account of the staggering number of art treasures borne along on waggons). Paullus embarked on a "reign of terror" by allowing Epirus to be sacked (as many as 150,000 citizens were enslaved) and condoning other reprisals, even as he himself embarked upon an archaeological tour of Greece. The kingdom of Macedonia lost its independence as a nation, was divided into four republics with elected magistrates, and paid heavy taxes to Rome. It became a Roman province in 146 BC.

The aftermath of the Battle of Pydna had two unexpected consequences for the spread of the Hellenic tradition. The first was that a young man named Polybius, son of Lycortas of Megalopolis in Achaea, was taken to Rome among the hostages deported after Pydna and became a close friend of the influential Roman Scipio Aemilianus, in whose circle he travelled widely and became privy to Roman political life at a high level. Polybius returned to Greece in 146 BC and became a distinguished historian. His *Histories* cover the years 264–146 BC (focusing on the period 220–168 BC) when Rome established its control over most of the inhabited world, which Polybius – given his background – saw as a unique event and sought to explain. His lucid narrative remains the main historical source for the period when Rome became master of the Greek east.

The spread of the Greek artistic tradition was also a by-product of the Battle of Pydna. Plunder brought to Rome made the Roman people aware of masterpieces of Greek art in the media of bronze and marble statuary, painting, and toreutic art. Greek art had a profound effect on the style of Roman art because of this contact. It is perhaps a historical irony that Paullus commandeered for a statue of himself a pillar erected

at Delphi that was originally intended for a statue of Perseus. It was topped with a bronze equestrian statue of himself above a sculpted frieze depicting a battle between Romans and Macedonians, that is, a real rather than a mythological battle. The Greek tradition of this type of monument was adapted by the Roman general for his own purposes, and was perhaps the first in the great tradition of Roman historical reliefs.

The site of Pydna at Kastro continued to be occupied in Byzantine times (known then as Kitros; the modern village of Kitros is nearby). Fortifications dated originally from the time of Justinian, and there are remains of early Christian churches and a later 10th-century basilica. It was captured by the Franks in the early 13th century, and finally by the Turks at the end of the 14th century.

Summary

A city in Macedonia founded in the 7th–6th centuries BC, Pydna was the site of the death in 316 BC of Olympias, mother of Alexander the Great. It was also the site of a battle in 168 BC at which Macedonian forces were decisively defeated by the Romans, ending the independence of Macedonia.

Pylos

City (or cities) in the western Peloponnese

Pylos now refers to four distinct places in the western Peloponnese, largely as a result of the attempts to identify the site of Nestor's palace as described by Homer. These are discussed from north to south.

In 1907 the German archaeologist Wilhelm Dörpfeld discovered and excavated three tholos tombs and the ruins of a building at *Kakovatos*, *c.*40 km south of Pirgos. He therefore concluded the site was Pylos as, following Strabo, many Alexandrian scholars had postulated that the Homeric site lay in Triphylia, an area also notable for the sandy beaches characterized in the epics.

The site at *Ano Englianos* (50 km south of Kiparissia) was identified in 1938 by a Hellenic–American expedition and excavated in 1939 and 1952–64 by Carl Blegen of the University of Cincinnati. A Mycenaean palace on a low hill with associated tholos and chamber tombs has been uncovered. It is the most comprehensible of all the Mycenaean palaces, though it is less impressive with its mudbrick walling and low elevation. The most important discovery was an archive room beside the entrance containing over 1000 tablets inscribed in the Linear B script; others and other types of administrative records were found elsewhere on the site. The palace was decorated with wall paintings in fresco; it had a central hearth in the megaron surrounded by four fluted columns in wood with clay chimney above. In the private wing was a bathroom with small tub. Copious evidence of pottery in functional contexts as well as stores of wine and oil contributes with the texts to a still unique picture of Mycenaean elite life. There are remains of a lower town at the base of the hill but little excavation has been carried out here. Since 1990 further study of the site and the region in general has been carried out by the American School of Classical Studies. Finds are to be seen in a small museum at nearby Chora with the most important items in the National Museum in Athens.

The rocky promontory of *Koryphasion* lies at the north end of the bay of Navarino. This bay (like that of Methone to the south) was, and still is, an important feature in the safe navigation of the west coast of the Peloponnese and the history of the area reflects this importance. Heinrich Schliemann in 1888 (after a preliminary visit in 1874) investigated the acropolis area, which was known as Old Pylos, and the cave of Nestor at the north end. In 1896 a French expedition also undertook some exploration in the cave. Ancient pottery (Middle Helladic to Roman) came to light. The small rounded bay to the north may have been the Mycenaean harbour. The southern tip of the promontory was fortified in 425 BC by the Athenians under Demosthenes and Cleon in order to cut off the Spartan contingent on the island of Sphacteria which closes the large southern bay on the west. The engagement is described in detail by Thucydides (4. 3ff.) and by Peter Green in a modern semi-fictional account. One of the shields, captured from the Spartans on their surrender after the dramatic siege of 72 days and later dedicated in the Stoa Poikile in Athens, came to light in the excavations of the Athenian Agora and is displayed in the Agora Museum.

From the 6th to 9th century AD the site was the home of a colony of Slavs or Avars from which it acquired the name of Avarinos or Navarino as the bay has become known. In the late 13th century AD Nicholas II of St Omer built a castle, generally known at this period as Port-de-Jonc, on the acropolis which featured in various engagments thereafter. In 1423 the castle was purchased by the Venetians. After the northern entry to the bay began to silt up and Don John of Austria bombarded the site in 1572, a new castle (Neokastro) was built

on the southeast side of the bay overlooking the southern entry and what became known as Palaikastro diminished in importance. It was taken by the Turks in 1501. Morosini recaptured it in 1686 and effected a few repairs.

The charming modern Neoclassical town, also known as *Pylos*, was built by the French in 1829. It lies at the foot of Mount St Nicholas on which stands the handsome and well-preserved Neokastro, built by the Turks in 1572. Plans have been put forward for several museums to be organized within the castle, notably one for underwater archaeology. In 1825 Ibrahim Pasha made Neokastro the centre of his operations and proceeded to devastate the province of Messenia. Two years later, under the Treaty of London, Britain, France, and Russia agreed to demand an armistice as a preliminary to a settlement of the Greek revolt against the Turks. After some months of unsatisfactory demands and manoeuvres, a letter of expostulation was sent to Ibrahim asking him the refrain from his actions against the Greeks on land. When it was returned with the manifestly false answer that he had left Navarino, the three admirals (Codrington, de Rigny, and Heiden) decided to sail into the bay on 20 October. The combined allied fleet consisted of 26 vessels, the Turkish fleet of 18 larger vessels and a mass of smaller ones, totalling about 80. Following a small incident in which a Turkish fire ship opened fire, a full-scale battle ensued. By the end of the day the Turks had lost over 50 vessels and over 6000 lives. No single allied ship was lost. European reaction to the victory was mixed from jubilation to puzzlement: it was referred to in the king's speech to parliament of the following year (the work of the Duke of Wellington) as "an untoward event". It did however lead directly to the evacuation of the Morea by the Turks and the full establishment of an independent Greece.

Summary

The ancient settlement of Pylos has been identified with four different places in the western Peloponnese: Kakovatos, 40 km south of Pirgos, site of tholos tombs; Ano Englianos, 50 km south of Kiparissia, site of a Mycenaean palace; Koryphasion, at the north end of the bay of Navarino, site of an ancient acropolis; and Pylos, the modern town. The area was the site of famous battles in 425 BC (on the island of Sphacteria) and 1827 (in the bay of Navarino).

Pyrrho *c.*365–275 BC

Philosopher

Pyrrho of Elis is regarded as the founder of Greek scepticism. He is said to have studied with a certain Bryson and the Democritean Anaxarchus with whom he travelled to India in the campaign of Alexander the Great. His acquaintances with the "gymnosophists" and the "magi" are said to have influenced his thought. Pyrrho did not leave any writings, but some knowledge about his teaching comes from his disciple Timon of Phlius (*c.*325–235 BC), a literary man who wrote satires (*Silloi*) parodying all dogmatic philosophers and contrasting them with Pyrrho. Pyrrho did not establish a school of philosophy in the institutional sense. There were no successors after Timon, although ancient doxography tried to invent a succession down to Aenesidemus (1st century BC). Pyrrho's teaching as transmitted by Timon enjoyed a revival several centuries later with Aenesidemus and Sextus Empiricus (2nd century AD), who systematized it. Our main sources for his philosophy are a substantial *Life* by Diogenes Laertius (9. 61–108), fragments from the Peripatetic Aristocles' *History of Philosophy* (1st century AD?) preserved by Eusebius (*Praeparatio Evangelica*, 14. 8), and the writings of Sextus Empiricus (especially his *Outlines of Pyrrhonism*).

However, these later sources do not always represent Pyrrho's teaching and there is some evidence that his later followers imposed a certain interpretation on his philosophy. Yet, given the state of evidence, it is extremely difficult to distinguish Pyrrho's original teaching from the later interpretations of it.

Pyrrho was primarily a moralist. His aim was to live a life of tranquillity (*ataraxia*). He apparently argued that everything was utterly indifferent. He maintained that there is no difference between good and bad things, just and unjust, and the like, and argued that it is only a matter of convention or habit that people believe things to be good or bad. Pyrrho was concerned to refute any natural basis for evaluating a thing as good or bad, but apparently he did not make the further move to dispute the possibility of knowing whether things are good or bad. On the contrary, he dogmatically asserted that things are neither good nor bad, and that they are only designated as such by convention. He seems to have expressed his ideas using a language such as this: "*x* is no more [*ou mallon*] this than *y*." Using such a non-committal language (already used by Democritus), he avoided making any value judgements. Yet this is not tantamount to the sceptic suspension of judgement (*epoche*) with which he was later accredited. Although Pyrrho may have distinguished sharply between *x appearing y* and *x being y*, he was concerned with the evaluation of things and not with the perceptual experience of them, i.e. with the question of the possibility of knowing them or with the nature or their apparent characteristics; and as far as their evaluation was concerned he found them indifferent. Dispensing with value judgements, Pyrrho liberated himself from all the anxieties that conventional value judgements impose on us and thus he was able to live a life of tranquillity and lack of affection (*apatheia*). Pyrrho's aim of achieving detachment from human concerns is confirmed by a number of anecdotes. He took no precautions against dogs, carts, and precipices and he was always saved by his friends. Again Pyrrho did not seem to act in this way because he disputed the evidence of the senses but because he considered that things were indifferent to him and that whatever might happen was of no account to him. Although Pyrrho found it hard to be entirely indifferent, he did attain a remarkable degree of imperturbedness.

So Pyrrho's main thesis was apparently neither epistemological nor metaphysical but primarily ethical. Yet his attitude was interpreted as a sceptical one by his followers, Timon, and by the later Pyrrhonians who relied on Timon. Timon reports that Pyrrho argued that things in themselves are indifferent, unmeasurable, and inarbitrable. Hence our perceptions are neither true nor false, their testimony is unreliable, and we should think that something is no more this than that. The moral to draw was that we should not commit ourselves to views about the nature of things on the basis of our senses since things are elusive and undetermined. This attitude may lead us first to speechlessness and then to imperturbability, which finally makes up a good life – admirably achieved by Pyrrho. Timon obviously understands the "no more this than that" formula as concerning the trustworthiness of perceptions and beliefs. According to this interpretation indifference is a result of diffidence to perceptions and beliefs and not to the value of things themselves. This interpretation is patterned on the main idea underlying the history of Greek scepticism and it could easily be imposed on Pyrrho's teaching. Yet there might well have been aspects of Pyrrho's teaching that encouraged such an interpretation.

Pyrrho's scepticism enjoyed a revival with Aenesidemus, who seceded from the sceptical Academy under Philo of Larissa and appealed to Pyrrho's radical scepticism because he wanted to restore scepticism in its pure form, castigating Academic scepticism, which tended to become more and more dogmatic. With Aenesidemus and later Pyrrhonians the focus shifts clearly to epistemology. Aenesidemus disputed the anecdotes about Pyrrho's life and maintained that Pyrrho's philosophy was based on suspension of judgement. He also added that suspension of judgement may lead us to pleasure too. Aenesidemus is well known for the systematization of the Pyrrhonian arguments against holding a belief in ten modes. By means of these modes the Pyrrhonian sceptic would be able to question any dogmatic claim or demonstration and to show how ill-founded they were.

Many Pyrrhoneans after Aenesidemus were physicians of the empirical school of medicine. Most prominent among them was, of course, Sextus Empiricus. Sextus is for us today the major exponent of Pyrrhonian scepticism, but it is evident that he relies much on Aenesidemus. In his main expository work of Pyrrhonian philosophy, the *Outlines of Pyrrhonism*, Sextus makes interesting distinctions between the Pyrrhonian and the other philosophies and he devotes a long section on the significance of standard sceptical phrases.

Pyrrhonian scepticism, like all forms of scepticism, was polemicized by Christian intellectuals in the Middle Ages since it undermined Christian dogma. Photios obviously had access to some of Aenesidemus' works and he reports on them in his *Bibliotheca*. In the Renaissance Pyrrhonian scepticism, like most ancient philosophical systems, enjoyed a revival, but there is little trace of a considerable impact on modern Greek philosophy. Recently, though, Pyrrhonian scepticism has been found appealing and modern Greek intellectuals such as Nikos Demou have stressed that it offers an honest alternative to philosophical discussions.

Pyrrhus 319–272 BC

Ruler of Epirus

Pyrrhus became king of the Molossians and created the kingdom of Epirus. As ruler of Epirus, he became one of the most respected military leaders of the Hellenistic age. He was revered in his own lifetime and later in antiquity for his expertise and military knowledge: Hannibal described him as the greatest of generals in both experience and ability. He is most renowned for his military successes which he achieved at the expense of heavy casualties to his own army – the so-called "Pyrrhic victory". However, while his career as a general and king was spectacular, he failed to fulfil the potential he promised. He fought against the rising power of Rome in southern Italy and in Greece against the Macedonian monarchs Demetrius Poliorcetes and Antigonus Gonatas. His career falls into three main phases: the establishment of his power in Greece (307–285 BC), his expedition in southern Italy (285–274 BC), and his return to and death in Greece (275–272 BC).

Pyrrhus, the son of Aeacides and Phthia, was born to a line that traced its ancestry back to Neoptolemus, son of Achilles. His career became wrapped up in the intrigues and intricacies of the early Hellenistic era known as the period of the successors. He became king of the Molossians in 307/06 BC while still only 12 years old when he was installed by Glaucias, king of the Illyrians, but he reigned for only five years before being expelled by Cassander in 302 BC.

In these early years Pyrrhus was embroiled in some way or other with Demetrius Poliorcetes, whom Deidameia, his sister,

had married in 303 BC and with whom he sought refuge. In 302 BC he served as a lieutenant to Demetrius Poliorcetes and Antigonus Monophthalmus on what was to be the losing side at the Battle of Ipsus in 301 BC, but remained loyal to Demetrius, acting as caretaker in Greece.

In 299 BC Pyrrhus was handed over as a political hostage to Ptolemy I. He married Antigone, the daughter of Berenice and Ptolemy I, and with the support of Egypt and Agathocles, tyrant in Syracuse, in the early 290s BC he became co-regent of Epirus with Neoptolemus. He soon removed his co-regent and consolidated his Epirot kingdom. He founded a city named Berenice (modern Preveza) in honour of his mother-in-law. On his wife's death, Pyrrhus married Larnassa, daughter of Agathocles, and received the islands of Corfu and Leucas as a dowry. A series of additional political marriages secured further territory around Epirus.

Following his success against Demetrius Poliorcetes' lieutenant Pantauchus, Pyrrhus added territory to his kingdom. He was given the title "Eagle" by the Epirots and began to decorate his helmet with a high crest and goat's horns at the side. The rift between Demetrius – who had declared himself king of Macedon – and Pyrrhus was widened by the death of Deidameia. In addition, Demetrius married Pyrrhus' estranged wife Larnassa, and took control of Corfu.

The rising power of Demetrius was met by the concerted efforts of Pyrrhus and other Hellenistic kings in the early 280s BC. Ptolemy sailed to Greece "to persuade the cities there to revolt", Lysimachus invaded the north of Macedonia from Thrace, and Pyrrhus attacked southern Macedonia (Verroia). The kingdom of Macedon was partitioned by Pyrrhus and Lysimachus, but Pyrrhus' successes were short-lived. The Aetolians shifted their support to Lysimachus, and Ptolemy ended his aid to Pyrrhus, who was forced to withdraw back to Epirus.

In 284 BC a request came from the people of Tarentum (and other Greek cities in Italy) to Epirus for help against Rome. Pyrrhus took up the invitation and fought for the cause of Greek cities in southern Italy. Early success at Heraclea with an army of infantry, cavalry, and elephants secured the support not only of Greek cities in Italy but also Italian tribes, the Bruttians, Lucanians, and Samnites. Pyrrhus then marched on Rome. Another victory was secured at Asculum in 279 BC, but again with some loss on the Greek side. Before he was able to consolidate these successes, he was distracted by another appeal, this time from the city of Syracuse in Sicily. There he fought in 278 BC the allies of Rome, the Carthaginians, and the Mamertines. In 276 BC Pyrrhus was recalled to southern Italy, was defeated by Rome in 275 BC, and returned to Epirus with a severely depleted army. He left a garrison in Tarentum but was never to return.

In Greece Pyrrhus embarked on a campaign in Macedonia in 274 BC before marching into the Peloponnese in 273 BC to respond to an appeal from Cleonymus. At Megalopolis he declared that he was fighting to liberate the Greek cities from Antigonus Gonatas, king of Macedon. His intentions are doubted by the ancient sources. Whatever Pyrrhus' plans, they were ended abruptly in 272 BC. During an attack on the city of Argos, he was killed: struck on the head by a tile thrown from the roof, he was beheaded by one of Antigonus' men.

Pyrrhus fought on behalf of the Greek cause for the cities of southern Italy and Sicily and had tried to liberate Greek cities from the king of Macedon, Antigonus Gonatas. At the time of his death he had established Epirus as a major power, and he had transformed Dodona into a major cultural outpost. However, his lasting legacy to Hellenic culture is his military exploits. His prowess as a military leader went before him, but his inability to secure victory without heavy losses has outshone his strategic and tactical expertise.

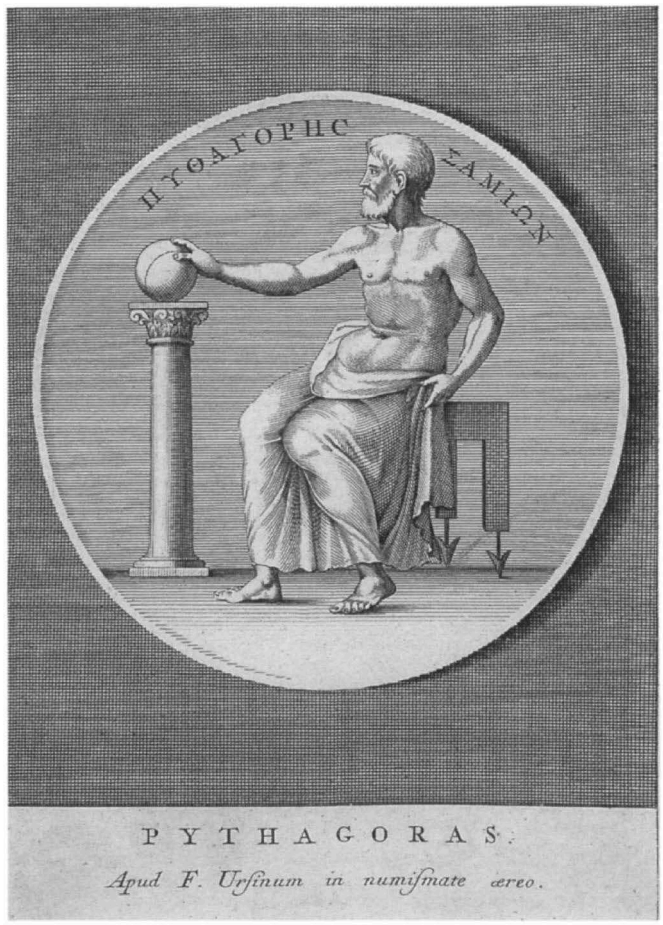
Pythagoras

Philosopher and mathematician of the 6th century BC

It is extraordinarily difficult to make any definite statement about Pythagoras, although he, and the philosophical tradition he founded, was clearly of the greatest importance in the development of Greek thought. He was born in Samos in the first half of the 6th century BC, son of Mnesarchus, a gem engraver. He moved to Croton in southern Italy around the middle of the 6th century, supposedly to escape the tyranny of Polycrates, and there formed a sort of society of followers ("Pythagoreans"), which involved itself in the politics of the Greek cities of Italy until there was a violent reaction, the Pythagoreans were massacred, and Pythagoras was driven from Croton; he died an exile in Metapontum. Nevertheless, there is clear evidence that in some places the Pythagoreans remained politically active in Italy well into the 4th century BC. The earliest reports represent him (sometimes in a negative sense) as a sage and wonderworker; he was reputed to have had a golden thigh, the ability to be in two places at once, and



Pythagoras

the power of prophecy. By the time that reasonably reliable reports become available (from the late 5th century BC onwards), he has already become a rather shadowy figure to whom a great variety of ideas could be attributed (and the situation is further confused by the reported practice of his followers of attributing all of their own ideas to him); Aristotle, who wrote an account (now lost) of Pythagoras, in his surviving works prefers to discuss "the Pythagoreans" rather than Pythagoras himself. Nevertheless, the fact that there was a group of serious thinkers who called themselves Pythagoreans (e.g. Philolaus, who composed a cosmology of which fragments survive, and Archytas, who did impressive work in mathematics and harmonics) confirms that Pythagoras' contribution to the development of thought, whatever it was in detail, was substantial and fruitful.

The ideas attributed to Pythagoras fall into two quite distinct categories (and indeed some ancient writers believed that this meant that he had two different sets of followers). First, he is said to have to have been a religious teacher, whose doctrines were based on the idea that souls migrate to new bodies (both human and animal) after death, and that by observing a series of rules and prohibitions the believer may achieve a better reincarnation in future lives. The most notorious of these rules were vegetarianism and abstinence from beans, and among others mentioned by various authorities are not picking up things that fall from the table, not touching a white cock, and not breaking a loaf of bread; they were as inexplicable in antiquity as they are now, and various attempts were made to interpret them allegorically as containing philosophical and moral truths.

It is, however, for his supposed contributions to mathematics and science that Pythagoras is remembered today. He and his followers are credited with making a crucial contribution to the early development of Greek mathematics, but it is very difficult to say precisely what this was, since it is to non-Pythagoreans (such as Thales and Anaximander) that most actual mathematical developments are attributed; the story that Pythagoras discovered the famous proof of the proposition that the square on the hypotenuse of a right-angled triangle is equal to the sum of the squares on the other two sides, the so-called theorem of Pythagoras, is found no earlier than Plutarch, who wrote in the 1st and 2nd centuries AD quoting one Apollodorus as his source (Plutarch tells us that on making the discovery Pythagoras sacrificed an ox to celebrate), and it is probable that the proof most often used today was devised by Euclid (*Elements*, 1. 47) rather than Pythagoras. Aristotle reports that the Pythagoreans claimed that "things are number" (though he could not understand what they meant by it), and certainly number played an important part in the Pythagorean picture of the world. Pythagoras is said to have discovered that the concordant musical intervals are produced by strings under the same tension whose lengths are in simple numerical ratios involving the first four integers (1:2 produces the octave, 3:2 the fifth, and 4:3 the fourth). Whether or not this is true (the reports come only in late authors), it began a process of applying the principles of ratio and harmony to the structure of the cosmos. So, the first four integers, represented by dots and arranged in a triangle, and their sum, 10, were thought to have special significance, and the Pythagoreans swore oaths by the *tetractys*, the diagrammatical representation of the relationships between these numbers in the form of an equilateral triangle. In some way, the generation of numbers, beginning with an original One, was the key to the understanding of the universe; the number of heavenly bodies was assumed to be 10 (because 10 was the perfect number), and their movement generated a musical harmony (which only the enlightened, like Pythagoras, could hear). Whatever Pythagoras' role in all of this, the idea that mathematics was fundamental to the universe, and that its study brought spiritual benefits, was undoubtedly a factor in encouraging the development of Greek mathematics beyond purely practical applications.

By the end of the 4th century BC Pythagoras had come to be regarded as the archetypical philosopher, and his supposed ideas had been incorporated into the mainstream of philosophy by the followers of Plato and Aristotle. We hear of very few philosophers who identified themselves as Pythagoreans, although preachers promulgating a popularized form of his religious ideas appear in new comedy. From the 3rd century BC onwards, however, he was sufficiently important a figure for a considerable number of forged documents to be produced under his name, a process that accelerated in the 1st century BC, when the school was refounded (the revived school is referred to by modern scholars as Neopythagoreanism, but is really a form of Platonism with a mathematical orientation); this later recreation and reinterpretation of Pythagoreanism makes the task of reconstructing the doctrines of the early

school considerably more complicated. Later, with the rise of Christianity, Pythagoras became a sort of pagan counter-Christ, and Iamblichus' *On the Pythagorean Life* (4th century AD) presents him as a semidivine sage and miracleworker, to whom the philosophical basis of a challenge to Christianity could be attributed. Interest in him continues well into the Byzantine period, and much of our information on later Pythagoreanism depends on the work of Michael Psellos (1018–after 1081), to whom we owe the survival of most of Iamblichus' work.

R

Railways

The historical evolution of Hellenic railways is closely related to the economic and social development of the country. Their evolutionary phases can be broadly classified in two periods: from mid-19th century to the end of World War II and from the end of World War II till today. A major characteristic of the first period is the development of many independent networks that served local needs for the transportation of goods and people. The reason for that development was mainly the geographical shape of Greece. The distinctive characteristic of the second period is the consolidation of the industry under a state monopoly. The changing conditions in the transportation industry made the operation of local networks inefficient, and subsequently required the state to take over the management of all the rail networks.

The first railway line was opened in 1869 between Athens and Piraeus and was operated by the "Athens to Piraeus Railway Company". During the 1870s no new network was constructed but by the beginning of the 1880s the need for new railways was apparent. The road network was underdeveloped and transportation was efficient only by sea. The construction of railways at that time was seen as a means of accelerating economic development and further integrating Greece into the world market.

In the spring of 1882 the parliament made a detailed examination of the plans for the construction of long-distance railways. Lengthy discussions took place about the width of the gauge. The government insisted on the construction of tracks with a gauge of 1 m, whereas the opposition favoured the so called "international" line that had a gauge of 1.4 m. This disagreement may seem to be irrational but was justified because of the cost of the technology: the larger the gauge, the more expensive the associated works, such as bridges and tunnels. The advantage of the so-called "international" line was the higher travelling speed. In the end, the government's proposal was accepted because of the lower financial expenditure, and because the travelling speed was not so crucial at that time.

The peculiar physical shape of Greece together with the established routes for transportation by sea led to the construction not of a large, compact, national network that would connect the principal cities with each other, but of many small, regional, autonomous networks that connected the flat regions of the country with the major ports. It should be noted that before the 1920s communication between Greece and other countries was conducted exclusively by sea; the railway line that connected Greece with the Balkans and consequently with the rest of Europe was not operational until 1913. The main railway networks, apart from the Athens–Piraeus railway, were as follows.

Piraeus–Athens–Peloponnese Railways. One of the first networks in the country, 650 km long, its construction started in 1882 and was finished in 1904 after many difficulties. It followed a circular route around the Peloponnese and connected the majority of the Peloponnesian cities with the capital. The first section to be opened to the public connected the Corinthian Gulf with the Saronic Gulf. Thus there was no need to sail all the way round the Peloponnese in order to arrive in Piraeus. The passengers or merchandise arrived by boat in Corinth and were carried by the railway across the isthmus to the other side where waiting ships transported them to Piraeus.

Thessaly Railways. Construction started in 1882, after Thessaly was liberated from the Turks, and was finished in 1886. The network had two lines: the first was from Volos to Larissa and the second from Volos to Kalambaka, a total of 220 km. The opening of railways made the transportation of agricultural products from the plains of Thessaly to the rest of Greece and abroad from the port of Volos more efficient and accelerated the modernization of Greece's economic infrastructure.

Hellenic Railways. This was the major railway network with international standards that finally connected Greece with the rest of Europe. Construction lasted from 1900 to 1909. It connected Piraeus with Larissa and the then Greek–Turkish borders. Its construction was considered a priority for at least two reasons. The first was the ability to move troops quickly and efficiently from southern Greece to the Turkish borders; the second was the opportunity for the Greek network to be linked to the European railways.

In Macedonia the Ottomans constructed the first railway in 1871. It connected Thessalonica with Skopje and it had a length of 243 km. One year later the line from Constantinople ro Alexandroupolis was completed. The connection of these two cities to the international network was important because for the first time it was possible to transport goods and people easily and efficiently by land to Central and Western Europe.

The Eastern Railways Company had the responsibility of managing these lines and had a monopoly in the ports of Thessalonica and Alexandroupolis. These two cities became the gates of the Ottoman empire not only to Europe but also to the Mediterranean. During 1892 construction began of the line from Thessalonica to Monastiri (modern Bitola), the second centre of commercial and strategic importance in Macedonia. In 1896 Thessalonica was connected with Constantinople. The railway connection between Greece and Macedonia was delayed for many years by the Turks who were conscious of the strategic importance of railways in the event of a conflict. It was finally achieved with the liberation of Macedonia in 1912–13.

In 1920 the Greek State Railway Company was founded and began to acquire the international lines of the country, and in July of the same year the Athens–Paris intercity connection was established. During the years 1920–40 no major construction of new railway lines took place except for some small extensions to the Macedonian network.

The construction and operation of railways in the context of a traditional economy and society such as Greece inevitably brought with it a series of changes. The presence of railways in the flat areas of the country accelerated a large-scale economic and social transformation, especially after the connection with the rest of Europe. Although in the years preceding railway construction the society and economy were by no means static, the underdeveloped state of the road network had kept the rate of economic and social modernization extremely low, given that the only efficient means of transportation was by sea. Despite the fact that migration was already an established social characteristic and urbanization was also in progress, and although agriculture in the regions of the Peloponnese, Thessaly, and Macedonia had already been integrated with the world market, such social features and economic developments were confined within certain geographical limits or social groups. The agricultural and industrial potential of the country had not been fully realized and commerce was heavily restricted to the coastal areas. Seasonal migration, excluding islanders, was a venture engaged in only by transhumant shepherds and a class of artisans. The advent of railways established close contacts between towns and villages, the ports and the hinterland, the country and Europe. This supported industrial development, increased commerce, and accelerated social transformation. In addition, railways contributed significantly to the defence of the country. During the Balkan Wars the deployment of troops to the front line, was extremely rapid, given the circumstances.

The end of World War II found the country's railways seriously damaged. Their repair began at once and was finished in a relatively short period. Meanwhile, the construction of an adequate road network changed dramatically the pattern of communications. The regional rail networks could no longer survive because the transportation of goods and people by road was more efficient. The only way for them to continue in business was by merging with the larger networks. After a period of industrial consolidation in 1971 the Organization of Railways of Greece (OSE) was founded, a state monopoly that took over all independent railway companies.

Unlike the railways in Europe, the development of Greece's railway network after World War II was relatively modest, despite initial efforts. The reasons for this can be traced partly to the automobile's domination of the country's transportation and partly to the management of the organization. Instead of focusing on customer satisfaction, on the provision of adequate services, and on the modernization of equipment, the company simply became one more organization of an inefficient state. Evidence of this is the fact that 70 per cent of rolling stock and locomotives are between 20 and 35 years old. In the 1990s some effort was made to modernize and expand the network and introduce new trains. Moreover, plans have been put forward for privatization.

Ravenna

City in north Italy

Ravenna, particularly in the 5th and 6th centuries AD, was the site of a culture which, while largely Latin-speaking and involved in Italian affairs, also absorbed much from the Greek east; Byzantine rule after 540 acted "as an incubator, which helped preserve Ravenna's own traditions and made possible its development as a dynamic and independent society" (Brown, 1988). The nearby harbour of Classis, especially in the earlier part of this period, maintained trade and communications routes with the east. (This was one of the main reasons why the western emperor Honorius moved his capital to Ravenna from Milan in 402 and why it continued in use as capital of the Ostrogothic kings Odoacer and Theodoric, and of the Byzantine Exarchs.)

During the Ostrogothic period close contacts with the empire were maintained. Theodoric himself had spent much of his youth in Constantinople (as a hostage) and acknowledged Byzantine sovereignty – his coins continue to bear the emperor's head; eastern involvement in the affairs of Ravenna increased during the regency of Amalasuntha (526–34). Greek influence is already evident in the churches of this time, and particularly at the basilica of Sant' Apollinare Nuovo, begun as the palace church *c.*490. The plan remains that of the traditional Roman basilica but there are conspicuous eastern elements, most obviously the exterior polygon of the apse, the articulation with pilasters of the outer walls, and marble columns imported from the imperial workshops of Proconnesus. The mosaic saints of the nave (mid-6th-century Byzantine replacements for the originals of Theodoric's time),

Ravenna: interior of S. Apollinare in Classe, consecrated in 549, with an apse mosaic of the Transfiguration

processing from the palace to Christ and from Classis to the Virgin, are a departure from the separable panels and more naturalistic figures of earlier mosaic and may be the work of craftsmen either from the east or at least trained by eastern mosaicists. (In Ravenna it is never entirely clear, however, what was the balance between imported eastern expertise and evolving local tradition.)

San Vitale, the only building in Ravenna which is eastern in plan as well as decoration, was also founded under Ostrogothic rule (*c.*525) and Cyril Mango has suggested that even before 540 it was designed to make a pro-Byzantine statement. Its completion in the late 540s under Justinian I's appointee as the first archbishop of Ravenna, Maximianus, unambiguously asserted imperial dominance (and the victory of Orthodoxy over the Arian Ostrogoths). This is most evident in the mosaics of the apse where Justinian and his consort Theodora, in their most famous surviving representations, lead their courtiers (including Maximianus) in an offering to the church. These confident, bejewelled, glittering figures, emphatically present yet, in their lack of depth and volume, otherworldly, suggest at least an awareness of recent developments in eastern floor mosaics. Losses as a result of iconoclasm mean that the mosaics at San Vitale are the best surviving indication of what contemporary church decoration in Constantinople was like, although as ever there will have been room for local variation. Certainly there are significant differences between San Vitale and the church of Sts Sergius and Bacchus in Constantinople, overall the most similar in design: in Ravenna the emphasis is more vertical and the whole drawn together by factors including the "placement of arcades in both the upper and lower zones of the niches ... the slenderness of the surmounting arches" and "the flood of light from rows of huge windows in the ambulatory, gallery, and the clerestory zone of the centre room" (Krautheimer and Curčić, 1986).

No expense seems to have been spared in the construction and decoration of San Vitale. It is known to have cost the considerable sum of 26,000 *solidi*, dispensed by the banker Julianus, either on his own account or on behalf of Justinian's treasury. Julianus is also recorded as patron of the contemporary basilica of Sant' Apollinare in Classe which was enriched, like San Vitale, with mosaics, marble revetments, and Proconnesian capitals and column shafts. To this day the buildings of Justinian's time, glinting with gold, semi-precious stone, or silver tesserae, give the impression that Ravenna was a splendid and closely integrated Greek imperial city. But in a number of ways the Justinianic survivals are unrepresentative, a brief Byzantinizing interlude; it is easy to exaggerate subsequent Greek influence on Ravenna. Brown has gathered the

evidence: no Greek literature connected with Ravenna is known (although there were four Greek monasteries), Latin remained the dominant official language, the archbishops after Maximianus emanated from the see itself, eastern immigrants appear to have been rapidly assimilated, and the city is rarely mentioned in eastern sources. After Justinian's time there was little by way of magnificent church building or decoration; lack of resources and weakened trade and communication routes ended imports from the imperial workshops and restricted or redirected the movements of craftsmen between east and west. (Mosaic work at Sant' Apollinare in Classe was, however, undertaken in the later 7th century, including representations of Constantine IV, his brothers, and his son Justinian II.)

Partly as a result of this cultural divide, relations with the Exarchs and with Constantinople were sometimes difficult. Local and fiscal disputes resulted in the murder of several Exarchs and there was lasting resentment at the savage reprisals taken against prominent citizens of separatist sympathies by Justinian II in 709. Both fierce opposition to iconoclastic decrees and the perception that Constantinople could or would do little to protect the Exarchate from the Lombards contributed to the revolt of 727, and the latter impression was confirmed both by Liutprand's capture of Ravenna in 732 and by the fact that it fell to Venice to expel him soon afterwards. By the time the Lombards under Aistulf took the city again in 751, it must long have been obvious to many that Ravenna's future lay in different directions from Constantinople. By 757, with Frankish aid, it was part of the pope's domain. Eclipsed as a trading power by Venice, especially once the harbour silted up, the city soon became relatively obscure.

Summary

Ravenna became the capital of the western Roman empire in AD 402 and later the capital of Ostrogothic Italy. During this time it absorbed much cultural influence from the Greek east. Captured by Belisarius for Justinian in 540, Ravenna remained a Byzantine possession until 751 when it fell to the Lombards. Ravenna's mosaics are among the best surviving examples of pre-iconoclastic Byzantine art.

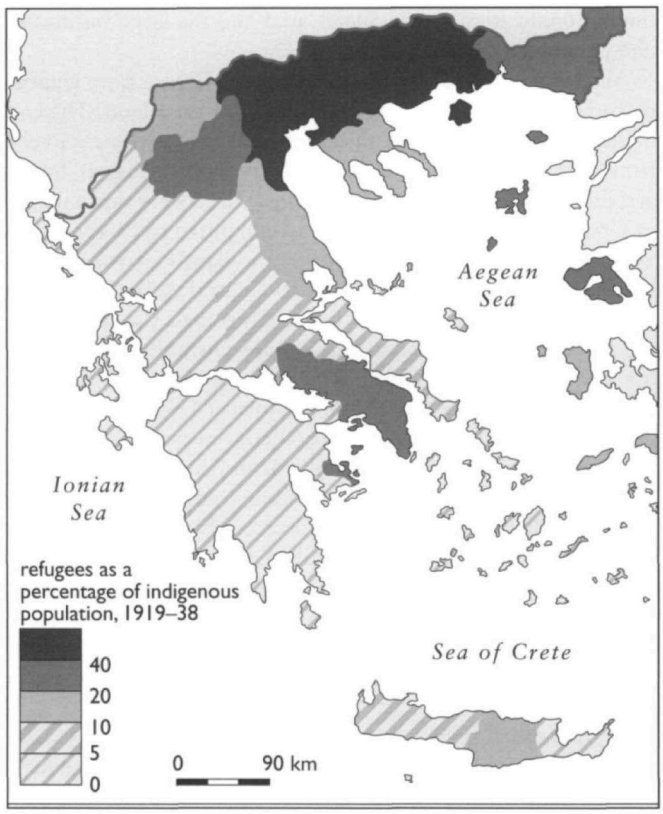
Refugees

Refugees have always played a significant role in the history of Greece. Even before the fall of Constantinople in 1453 groups of refugees from Greek lands conquered by the Ottomans sought refuge in Venetian-occupied Crete, the Ionian islands, and even the Italian states themselves. The flow intensified in the half century before the fall of Constantinople, when numerous Greeks (among them many intellectuals) emigrated to Italy, bringing with them the scholarship which helped underpin the Renaissance. The best-known example is the philosopher Plethon (who spent a year in Florence) but also Chrysoloras and Bessarion and Isidore of Kiev, of whom the last two became cardinals. Emigration continued after 1453: there is for example some evidence that a group of Greeks from Constantinople settled on the island of Patmos, probably in the second half of the 15th century. Following the fall of Crete in 1669 and the wars between the Ottomans and Venice, groups of Greeks (usually associated with revolts in favour of a western power) took refuge in the Ionian islands but also further west, in Italy, France, and even Britain; smaller groups went to Spain (Domenikos Theotokopoulos, known as El Greco, was such a refugee). A few hundred Greeks from Rhodes settled in Malta with the Hospitaller Knights of St John in 1530; between 1532 and 1534 several thousand inhabitants of the Peloponnese settled in southern Italy and Sicily after the failure of the campaigns of Charles V in the Peloponnese. Similar waves of refugees were generated after the Russo-Turkish wars of the 18th century, usually towards the Ionian islands but also further north (to Venice, Trieste, Austria, and Hungary) and west (to Naples, Livorno, even Minorca). Large numbers, mostly from the Black Sea coast (the Pontus), also settled in the Ukraine and the Crimea. In the second half of the 17th century groups of Greeks from Mani (in the southern Peloponnese) settled in Italy but also in Corsica. Still in pre-independence Greece, groups of refugees escaping from Turkish depredations left the plains and colonized much of the mountain uplands of the Greek mainland, forming virtually autonomous enclaves. Their relative freedom allowed them to play a major role in the spread of learning and the Greek Enlightenment, which in turn paved the way for the struggle for independence.

Refugees from throughout and beyond the modern-day Greek frontiers participated in the Greek struggle for independence (1821–30). The operations of the struggle created considerable upheavals throughout the Greek mainland, as well as the archipelago, Asia Minor, and Cyprus; large numbers of people were made refugees; several thousand Cypriots left the island in 1821. Some of these refugees (perhaps most) settled in Greece, but others emigrated to southern Russia, the Caucasus, western Europe, and the United States, where (among others) orphans from the War of Independence were settled or rehomed. Once the Greek state was formed, war refugees from throughout the Greek world settled within the new state, in large enough numbers to create the question of the *eterochthones* (or foreign-born Greeks) that was to remain controversial for some time.

However, the largest groups of refugees arrived in Greece in the course of the 20th century, usually (but not exclusively) as a result of the antagonisms of the Balkan states.



41. Density of refugees settling in Greece from 1919 to 1938

Chronologically the first wave of such refugees to arrive in Greece was from Bulgaria; the thriving Greek communities of eastern Rumelia, incorporated in the principality of Bulgaria in 1885, suffered during the early years of the 20th century. An example is the city of Anhialos (Anhiolu) on the Bulgarian Black Sea coast: almost exclusively Greek in 1900, it was destroyed in the course of a Bulgarian pogrom against the Greeks of Bulgaria in 1905, in retaliation for Bulgarian reverses in the Macedonian struggle. Numerous Greeks from Bulgaria subsequently sought refuge in Greece; most were settled in Thessaly.

The policy of Ottomanization pursued by the Young Turk regimes, especially after 1914, created a wave of some 90,000 refugees from Asia Minor, eastern Thrace, Pontus, and Constantinople; they sought refuge in Greece. The outbreak of World War I caused an intensification of the process of Ottomanization, and even more Anatolian Greeks were made refugees, often to allow for the settlement of Muslim refugees from the Balkans.

The largest wave of refugees was, however, yet to come to Greece, in the wake of the Greek army defeat in Asia Minor, in August 1922. The immediate aftermath of the defeat included the destruction of the Greek and Armenian quarters of the city of Smyrna, burnt by Turkish troops. Many of the Greek male inhabitants of the city faced death or deportation to work camps in the interior of Asia Minor; few were eventually to survive. Virtually all other Greek inhabitants of the city had to be evacuated to Greece; most arrived destitute, some with the clothes they were wearing their only possession. This was followed by a more orderly, but equally comprehensive evacuation of the coast of the Sea of Marmara and eastern Thrace, handed to the Turks following the Chanak affair in October 1922. The Lausanne Treaty of 1923 included a clause on the compulsory exchange of populations between Greece and Turkey; all Orthodox Christians of Turkey (with the exception of inhabitants of Constantinople) were exchanged for the Muslims of Greece (with the exception of the Muslims in western Thrace and some Albanians). The exchange began in 1922 and was completed by 1924.

The precise number of refugees is not known; little effort was made at the time to provide statistics of the mostly destitute populations coming into Greece. A considerable number of them also succumbed to disease shortly after arrival. It is estimated that between 1.2 and 1.5 million refugees entered Greece after 1922, while some 350,000–400,000 Muslims left. Over 45 per cent of the refugees were populations of rural origin, the rest urban.

The vast majority of incoming rural refugees were settled in northern Greece, in rural areas of Macedonia and Thrace; for the urban refugees, resettlement originally meant living in houses vacated by Muslim city dwellers, while a considerable proportion of them had to live in shanty towns created in the outskirts of large towns and cities. The settlement of the refugees was a colossal task. That of the rural refugees proceeded relatively quickly, and was almost complete by 1938. The urban refugees' resettlement proceeded at a much slower pace and was not completed until the 1950s. For both the urban and rural refugees, the process was highly bureaucratic, painful, and often humiliating.

The Asia Minor refugees contributed to the economic development of Greece in many ways: some of them (especially those coming from Smyrna) had enjoyed under the Ottomans a standard of living that was considerably higher than that of mainland Greece in the years before 1922. They brought with them much-needed entrepreneurial, industrial, and agricultural skills, but also a degree of political and cultural sophistication often higher than that of the mainland. They also became a ready pool of cheap labour for Greece's fledgeling industry. At least some of them became a target group for the – then new – ideas of communism: some of the most prominent-ranking members of the Greek Communist Party at the time were refugees. Greece's first Nobel Prize winner, George Seferis, as well as numerous other writers (Yorgos Theotokas, Ilias Venezis) and painters (such as Photis Kontoglou) that were to make a major impact in the country's cultural life were also refugees.

In politics, the refugees provided a relatively stable source of electoral support for the Venizelist side throughout the interwar years. It was the numerical strength of the refugees and their support for Venizelos that made it possible for him to return to power in 1928. The large numbers and relatively compact pattern of settlement (almost 90 per cent of the rural refugees were settled in whole villages in Macedonia and Thrace) also created a divide between refugees and non-refugees in the countryside; this divide (also mirrored to a lesser extent in cities) repeatedly degenerated into violent conflict in the interwar years and would endure for many decades.

The refugees from Asia Minor and eastern Thrace were by no means the last refugees to arrive in Greece. Greeks from Bulgaria continued to emigrate to Greece as prescribed by the

voluntary exchange of populations under the Neuilly Treaty signed in 1919 between Greece and Bulgaria. It is estimated that around 70,000 Greeks came to settle in Greece from Bulgaria between 1919 and the late 1930s. An estimated 100,000 Greeks from southern Russia, the Crimea, the Caucasus, and the Ukraine also came to Greece between 1920 and the outbreak of World War II, most arriving in the wake of the upheavals caused by the Bolshevik Revolution and the Civil War. Further numbers of Greeks also became refugees during the Axis occupation of Greece (1941–44) and the Civil War (1946–49). Over 100,000 Greeks were forced to leave Bulgarian-occupied eastern Macedonia and Thrace between 1941 and 1944. The refugees from Asia Minor that had been settled in the region after 1922 were specially targeted for expulsion by the Bulgarian occupation authorities. Some of the refugees from the Bulgarian-occupied areas never returned, settling in other parts of Greece after the liberation in 1944.

The Civil War resulted, among other things, in further numbers of refugees. During the Civil War a practice was developed by the National (Government) Army by which whole villages from areas controlled by the insurgents were evacuated and their inhabitants resettled. They were often moved to shanty towns, always near larger cities under government control. These were the *antartopliktoi* (victims of the guerrillas) or *kataphygontes* (those who sought refuge); it is estimated that some 700,000 persons or approximately 10 per cent of the population fell into this category. Once the hostilities were over, many did not return to their home villages, thus creating the first wave of the postwar population movement from the countryside that greatly increased the population of urban centres.

On the other side of the Civil War divide, both during the hostilities and following the communist defeat, considerable numbers of supporters of the communist guerrillas left Greece, some forcibly, most voluntarily; initially most went to Albania and Yugoslavia. They were subsequently resettled in the countries of the Eastern bloc and in the USSR, creating a string of Greek settlements ranging from the German–Polish border to Tashkent in Soviet Central Asia. They were banned from returning to Greece, at least until 1974; the bulk of them were only repatriated in the early 1980s.

In the 1950s and 1960s the Turkish authorities forced or "encouraged" tens of thousands of Greeks from Istanbul, as well as the Greek inhabitants of the islands of Imbros and Tenedos (given to Turkey in 1923), to emigrate to Greece; the pressure was especially strong during periods when relations between Greece and Turkey were tense, typically over differences related to Cyprus. Such an incident took place on 5–6 September 1955, when large numbers of Greek homes and businesses in Istanbul were looted by mobs, with some loss of life and massive destruction of property. The anti-Greek riots were organized with the connivance if not the support of the Turkish authorities and were the trigger for the large-scale exodus of the once thriving Greek community of Constantinople. While some Constantinopolitan Greeks emigrated to other countries, most settled in Greece. A considerable number of Greeks that had been living in Egypt also came to Greece following the Nasser revolution of 1956 and the nationalization of the Suez Canal and the large businesses and private estates that followed.

Yet another wave of refugees arrived in Greece from Cyprus in 1974, following the Turkish invasion of the island. The end of the Cold War brought more refugees into Greece: Greeks from the former Soviet republics (especially Georgia) began arriving in Greece in the early 1990s. They were descendants of Greeks from the Pontus who had emigrated to Russia in the 19th century. They had suffered at the hands of Stalin (who had had many of them deported to Central Asia); and while perestroika brought a revival in their fortunes, the collapse of the Soviet Union created a much more unstable environment for relatively small minorities such as theirs. An estimated 100,000 Greeks emigrated from the former USSR to Greece in the early 1990s, and this emigration continues.

The collapse of the Stalinist regime in Albania also resulted in a new wave of refugees: numerous ethnic Greeks from southern Albania streamed into Greece, also beginning in the early 1990s. While many are simply seasonal migrant workers, a number of them have settled in Greece more or less permanently. Finally, a number of political refugees fleeing from repressive regimes (most Kurdish, but also others from African and Asian countries) have sought and been granted asylum in Greece.

In the short term, the successive waves of refugees has invariably caused considerable economic and social problems to Greece: their resettlement and absorption has required and still requires considerable economic and social capital; and social division and tensions have also arisen, sometimes to boiling point. Similar tensions are to be observed today, with the large number of economic migrant workers and refugees in residence in Greece, some in a highly precarious economic state; the legal position of considerable numbers of them is also not very clearly defined. Yet, in the long run, the refugees have traditionally proved highly beneficial for Greece: not only have they contributed to the economic development of the country not least by bringing new skills and increasing the workforce; they have also given Greece a high degree of ethnic homogeneity, making it the most homogeneous national state of the Balkans.

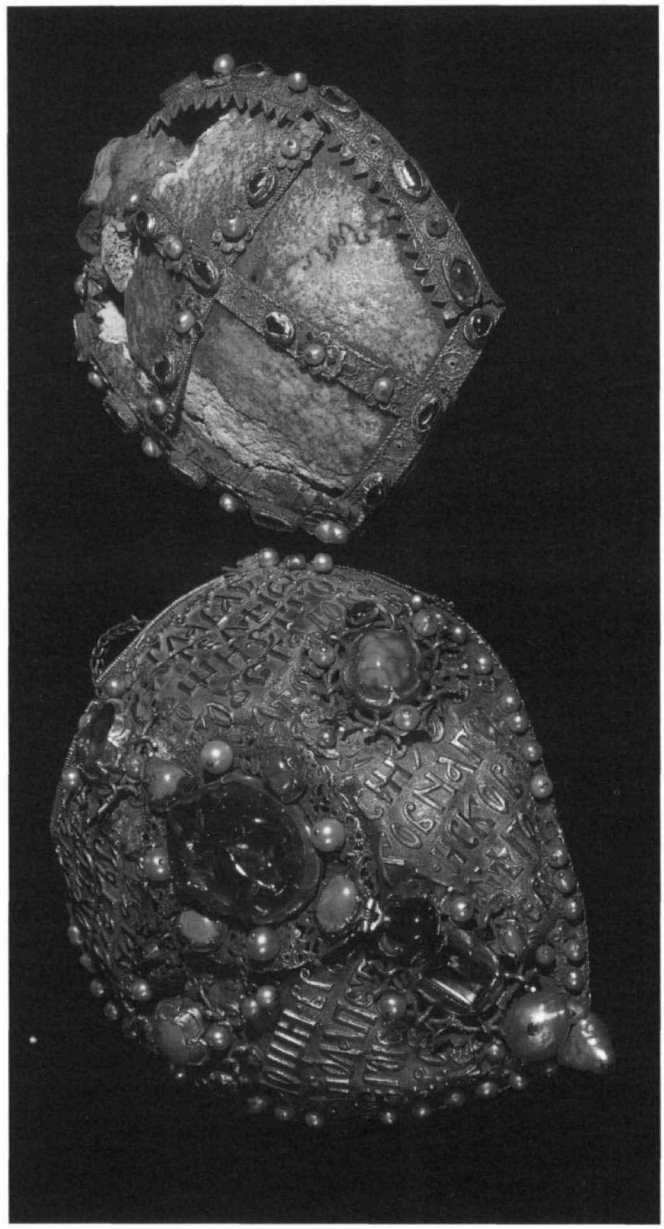
Relics

The veneration of relics (the physical remains of the saints, or articles closely associated with them) became a part of active Christian devotion from the 4th century onwards, and remains a distinctive aspect of the Greek Christian tradition to the present day. The practice also marks western Catholic Christianity, from its shared historical and doctrinal roots, but was decisively rejected by the Protestant Churches of the Reformation.

Biblical roots of the religious practice can be traced in the Old Testament narratives of Elisha assuming Elijah's cloak as an effective symbol of the transference of divine charismata to the new prophet (2 Kings 2: 14), or in the story of how the bones of Elisha raised a corpse to life when laid upon them (2 Kings 13: 21). The New Testament continued this oriental tradition of seeing even material objects as capable of being imbued with divine charisma, as for example in the stories of Jesus curing the woman who merely touched the fringe of his garment (Matthew 9: 20), the wonderworking talismans of Paul (Acts 19: 12), and the thaumaturgical shadow of Peter (Acts 5: 15). The standard Jewish-Christian practice of exhumation of the dead, and the subsequent reburial of the bones in an ossuary, perhaps also created a positive environment for the formation of a Christian cult of the dead. This was certainly alien to the widespread contemporary Roman mentality which regarded the relics of dead with distaste and fear (akin to modern European attitudes) .

The beginnings of the Greek Christian cult of relics have usually been referred to the devotion offered to the early martyrs, especially those of the 3rd and 4th centuries. Already the description of the martyrdom of Polycarp (mid-2nd century) speaks of the faithful gathering up his relics, "more valuable than precious stones and finer than refined gold", which were then taken back to a martyrium where his memory could be commemorated regularly. A similar aspect is seen in the account of Ignatius of Antioch's martyrdom, after which fragments of his body were "put into a coffin like an inestimable treasure". The cult of the martyrs became powerful and popular within the Church. The early martyria shrines were focuses of regular commemorations throughout the Christian world (eventually to become the Christian liturgical calendar) where Eucharistic celebrations and feasts were held around the tombs of the saints. The martyrs were believed to be immediately admitted to heaven with the power to intercede for the earthly Church, and to act as powerful patrons in adverse times. The cult of martyrs, obviously attached to their tombs and physical remains from the very logic of its origins, eventually spread in Christian practice to encompass other Christian heroes: notably confessors (those who had courageously witnessed but survived) and hierarchs. The holy ascetics of the 4th and 5th centuries became new focal points of Christian devotion.

By the time of the mid-4th century the cult of the relics of the saints was so widespread that a series of *inventiones* was taking place. The relics of past Old Testament prophets or other historic saints, such as John the Baptist, were discovered to popular acclaim. The form of the *inventio* usually followed a revelatory dream to a significant figure. In the 5th century Cyril of Alexandria had revealed to him the whereabouts of



Relic: two pieces of the skull of St John the Baptist, decorated with gold and semi-precious stones, Topkapi Palace Museum, Istanbul

powerful relics of martyrs who would do battle with Isis in his own generation. Ambrose of Milan discovered the relics of Sts Protasius and Gervase. The empress Eudoxia in the Holy Land discovered the relics of St Stephen and had a triumph in bringing them back to Constantinople. Dominant figures in the newly ascendant Christian empire thus sought to associate themselves with the mediatory efficacy of the saints in a political culture where intercession with the throne was viewed as the primary avenue to power. The discovery of relics also extended to the finding of notable objects of the Passion. The stories of the discovery of the True Cross, the nails from Calvary, and other sacred objects belong to this era. The *inventio* was often followed by a "translation" to a suitable place of worship, or the establishment of a new and splendid oratory. One of the most famous of these early translations was that of

St Babylas the Martyr, whose remains were brought by Caesar Gallus in 351 to a shrine adjacent to the great temple of Apollo at Daphne in Antioch. Later, when Julian learned that the oracle there had ceased to function, he indignantly sent back the saint's bones. Julian scornfully denigrated Christian churches at this time as having become little more than charnel houses.

Christian Constantinople, just as it rose in the ascendancy of political influence, also became a veritable repository of the most venerable cult objects of the ascendant religion. Up to the time of the Fourth Crusade (which had among its policies of depredation the explicit aim of forcibly taking famous relics to disseminate them among the princes of the west) Constantinople was a famous pilgrimage centre. It possessed two pieces of the True Cross (one taken from Jerusalem, one from Apamea), the pillar of scourging, the crown of thorns, the sponge, and the lance. Among its relics of the Blessed Virgin was the famous robe kept at the palace of Blachernae and used as a palladium for the imperial city (evidenced in the famous Greek hymn of the *Akathist*, and in the cultic celebration of the feast of the Protecting Veil). The shrines of saints in the city, with their relics, were innumerable. Demand for relics of the saints became so widespread that dismemberment of their bodies became commonplace in the East (though discouraged until much later in the Roman Church), and eventually the liturgical service of dedicating a new church was forbidden without the practice of placing relics of saints under (now within) the main altar. To this day, apart from relics within the altar in all consecrated Orthodox churches, the relics of saints must also be sewn into the *antiminsiou* (the cloth on which the sacred mysteries stand during the eucharistic liturgy), and without the *antiminsiou* no liturgy may be celebrated.

Some Christian writers in antiquity attacked the potential abuses of the veneration of relics. The first to do so was the 5th-century presbyter Vigilantius of Aquitaine, who was lambasted for his pains by Jerome. At this time Jerome enunciated the principle that the relics of the saints were venerated, but not worshipped, for the sake of reverence to the Lord whose martyrs they were. This was to remain, substantially, the central Christian theological principle of the cult. It is a matter of current debate whether relic veneration was attacked by the iconoclasts in 9th-century Byzantium, but John of Damascus certainly defended the practice of relic veneration, refining the standard Greek theology of relics in the process. The second Council of Nicaea in 787, and that of Constantinople in 1084, confirmed the basis of the doctrine for the eastern Church. Relics are henceforth regarded as sacred objects, veneration of which passes directly to the saint involved. As the saints in life were special vehicles of the divine grace of sanctification, so now those saints have access to the throne of God, and offer continuing patronage to their new kin groups, those within the Church who gather around their earthly remains. The relics themselves, like the icons, were regarded as possessed of particular grace. On the feast of the saint, or on the occasion of the translation, works of grace were expected from the saint, and, from ancient times even to the present in Orthodox practice, pilgrimages were made to the shrines on such special occasions.

Some modern commentators have regarded the Christian cult of saints' relics as a by-product of the ancient Hellenistic cult of the heroes, whose tombs were often located in the most notable ancient temples, and from whom benefits were often sought (such as the relics of Theseus translated to Athens in 469 BC, found by virtue of an oracle and a prodigy, at whose tomb the poor prayed for relief). It is difficult to speak collectively, or entirely to disregard numerous instances of superstitious abuse within Christian history, but it should be noted that the cult of the saints in antiquity was always carefully distinguished from the cult of the dead heroes by its literate defenders (usually monks or hierarchs). Apologetical writers such as the Syrian bishop Theodoret in the 5th century ruefully ask why the Christian practice has aroused so much antagonism in the Hellenistic world, when the temples themselves encourage the cult of heroes. Eusebius of Caesarea in the 4th century is also at pains to distance Christian devotion from Hellenistic superstitions. The refined Byzantine theology of the period after iconoclasm elevated the attitude towards relics (and icons) as illustrative of a Christian's whole attitude to sacramental efficacy – the principle at stake being to what extent a material form can act as a valid medium of spiritual grace. The east, with its firm belief in the direct incarnation of God in the flesh, took a positive view on that matter, and this is mainly why its active veneration of the relics of the saints is closely bonded with its very concrete theology of the deification of the flesh by Christ. For this reason, unlike western Christianity, the Greek Christian tradition saw relics as substantive to the true faith rather than peripheral.

Religion, Ancient

In attempting to describe Classical Greek religion, it is necessary to state at the outset that the Greeks themselves had no word to describe our concept of "religion", no comparable conception of a sphere of life marked out from the "political" or the "secular". Greek religion, moreover, did not – like modern Christianity – focus upon a set of dogmas or principles to which a man or a woman consciously chooses (or declines) to adhere. Nevertheless, even without a body of sacred texts, without an organized Church with the professed purpose of ensuring uniformity, the Greeks shared a roughly coherent set of beliefs and ritual practices that merit description together.

Greek religion was polytheistic. A core group of so-called Olympian divinities (those who were held in myth to live on Mount Olympus) was often numbered 12, but the identity of the 12 varied: the Parthenon frieze featured Aphrodite, Apollo, Ares, Artemis, Athena, Demeter, Dionysus, Hephaestus, Hera, Hermes, and Zeus. Though some of these divinities would have been familiar to all Greeks – Zeus, Demeter, and Hermes, for example – there was great variation both in the deities worshipped and in the relative emphasis given to different deities in different Greek cities and regions. Poseidon was associated particularly with the city of Corinth, Athena with Athens, Hera with Argos and Samos. Different cult titles or epithets were applied to divinities in different areas: Athena Polias (or "of the city") in Athens or Zeus Lykaios (named after a local mountain) in Arcadia.

These relationships between cities and divinities were not exclusive or monogamous ones: Poseidon also held a central place in Athens, Athena in Sparta (even under the title "Polias"). Other local deities, however, such as the Arcadian goddess Despoina (or "mistress") or the Spartan Helen (though they may have shared certain attributes, or even sometimes fused, with Panhellenic deities), were more or less restricted to particular localities. In addition, there were a large number of lesser divinities such as nymphs (believed to inhabit and somehow to embody rivers, trees, and mountains) and heroes. The latter, a particularly disparate group, included the Panhellenic Heracles (also worshipped as a god); mythological characters, for example from the Trojan War; and historical individuals worshipped after their deaths, such as the Spartan Brasidas, the antagonist in the Peloponnesian War of the Athenian historian and general Thucydides. In Athens, the city that is best documented, we know of the existence of hundreds of heroes.

How are we to understand this confusion of deities? Were the Argive and Samian Hera, say, or the Spartan and Athenian Athena Polias, one god or two? The answer is probably that they were believed to be both different and the same. That the names of so many divinities, and the stories of their exploits, were common across the Greek world clearly means something, even if the devotees of a god's different cults were distinct. In his odes in honour of the victors of Panhellenic festivals, when a victor's home city possessed no cult of the Panhellenic deity in question, Pindar addressed himself to a different local manifestation of that god. In describing an instance of divine intervention, Herodotus will sometimes ascribe it at one moment to a named divinity, at another to a generalized divinity, "the divine", or "the god". A powerful principle in Greek religious thought was that the nature of the gods was fundamentally unknowable, and that the distinctions between divinities, and their characterizations through myth, were traditional, even arbitrary. Far from leading to widespread scepticism concerning the existence of the gods, this "uncertainty principle" seems, however, to have cushioned the individuated gods of myth and ritual from challenge.

The relationship between men and gods in Greek religion is often portrayed in modern accounts as more contractual than personal: the proper observation of ritual duties – especially of sacrifice, accompanied by prayer – was rewarded by good fortune in the form of, for example, a good harvest, the birth of children, or through negative blessings such as the absence of disease or a journey free of shipwreck. (The idea of personal salvation after death was not widespread, being limited largely to the mystery cults such as that of Eleusis.) Though a greater emphasis perhaps was given to ritual than in many other religious systems, the exchange was not quite so crudely commercial. In literature emphasis is often placed on the spirit in which propitiation of the gods was performed. A man's past actions may make his sacrifice unwelcome. Xenophon's account in his *Anabasis* of his journey into Asia with a group of Greek mercenaries, the so-called Ten Thousand, reveals also an extraordinarily warm piety.

Other differences between Greek religion and Christianity have also perhaps been exaggerated. The existence of sacred texts or an organized Church demonstrably fails to ensure more than a degree of uniformity in belief and practice. Though there was never in the Greek world any identifiable core set of beliefs to which adherence was demanded, there were limits to diversity and toleration: a number of prosecutions for impiety took place in the late 5th and early 4th centuries BC in Athens; the grant of divine honours to rulers such as Alexander encountered opposition. Though we cannot talk in a Greek context of "belief" in the sense of a personal leap of faith, the reality of Christian belief reveals a number of similarities to Greek religion. Just as Christian belief in an ever-loving and just god must explain the appearance of injustice, so Greek belief in the gods' unfailing response to propitiation must incorporate similar strategies for explaining exceptions. A similar pattern can be seen underlying other areas of Greek belief. The belief that gods punish unjust or impious actions – there was a considerable overlap between the ideas of the pious (*hosion*) and the just (*dikaion*) – is maintained by means of a number of such "let-out clauses": that retribution may occur through human agency, that it may follow immediately or be delayed even for a number of generations, or that, while the divine is, in general, just, it may also be capricious. The Greek belief in the reliability of oracular prophecy (from shrines such as Delphi, Dodona, and Didyma) similarly relies on a number of explanations for prophecies that are patently never fulfilled: that the correct interpretation was not discovered, that undue influence had been exerted (or even that the priestess had been bribed), that the consultant at the oracle had committed some error in procedure, or that some prophecies are simply misleading or dud.

A consequence of the lack of a clear separation of "sacred" and "secular", the lack of a distinction of Church and state, is that it is perhaps less easy to generalize on the political implications of Greek religion. A number of activities or aspects of

life that we would casually class as secular were in the Greek world coloured or shaped by religious practices or beliefs. The political relationships between Greek cities were regulated through religion: when one city founded a colony, the flame for the sacred hearth of that colony was taken from its mother city; the relationship of colonizer and colonized was a relationship of religious duty. Treaties between cities, termed in Greek *spondai* (or "libations"), were marked by oaths sworn by the gods, accompanied by sacrifice: Thucydides records how in the Peloponnesian War the Spartans ascribed a number of military reversals to their breaking of a treaty. Many official aspects of city life – politics, the administration of justice – were touched by religion: as the comic playwright Aristophanes reveals through a parody, the assembly meeting started with a prayer. Oracles and prophecies were also clearly introduced into arguments in the assembly. Greek tragedy and comedy themselves were performed in the context of religious festivals such as the festival of Dionysus. Though there were professional oraclemongers and diviners, priests never formed a separate caste in Greek society. Rather they were drawn from the population at large, sometimes by virtue of family, but increasingly by election or by lot. The magistrates of Athens or the kings of Sparta performed functions that we would classify as a mixture of sacred and secular.

Religion was also central to the Greeks' perception of their identity in relation to foreign peoples and one another. The Greeks represented their gods as universal and found equivalents for them among foreign peoples, saying, for example, that Dionysus was the Greek name for Osiris or that the Ethiopians worshipped Zeus and Dionysus "alone of the gods". There was consequently no need felt to "evangelize" foreign peoples; for a Greek to proclaim a "war of religion", a crusade, was unthinkable. Herodotus describes as madness the action of the Persian king in mocking the rites of the Egyptians. Nevertheless, it is arguably no coincidence that such, often imaginary, religious crimes are ascribed to foreign peoples (so-called "barbarians") rather than to Greeks. Stories of the punishment of such actions are often reported with relish. Moreover, though they may have espoused an ideal of toleration of foreign practices, and though they may have thought most foreign gods had equivalents in the Greek pantheon, the line was drawn at common worship. Though the long-standing Greek god Dionysus was perceived as of eastern origin, genuine newcomers such as Adonis, Sabazius, Bendis, and Asclepius (from within the Greek world) were assimilated into the cult system of a city only with difficulty and some reluctance. Panhellenic festivals such as the Olympic Games were closed to non-Greeks. Those Greeks who settled in Egypt built their own temples: the Hellenion for common use and other shrines of Zeus, Hera, and Apollo for settlers from Aegina, Samos, and Miletus respectively.

As this last example demonstrates, the citizens of different Greek cities were conscious of their distinct religious identities. Just as the Olympic Games were barred to non-Greeks, so certain city festivals were barred to non-citizens. Citizens belonged, however, to more than one religious community: phratries (or brotherhoods – groups based on, at least perceived, common descent), tribes, demes (or villages), and families, all had religious rituals associated with them and all were doubtless the focus for some feeling of community.

Perhaps the hardest issue in the study of Greek religion is the assessment of change. During the 5th century BC there was a particular upsurge in religious scepticism: the development of natural, "scientific", explanations of disease or madness, observations of the injustice of the gods, that the gods were created as a form of social control, or that the belief in divination was a popular superstition. It is important, however, not to see scepticism on such issues as heralding a general or widespread reaction against religious belief. A certain degree of questioning and doubt was integral to Greek religion in all periods. Many of these sceptical positions – the injustice of the gods, for example – were rooted in traditional attitudes. Such changes as occurred as a consequence of events – the failure of Athenian diviners during the Peloponnesian War, for example – were probably largely piecemeal. The Greeks to a large extent had prepared answers for such eventualities: most diviners are charlatans; not all forms of divination are equally reliable. There is no reason, or evidence, for supposing that such reversals sparked a general decline in divination or in religiosity. Perhaps the clearest changes in Greek religion occurred as a consequence of Alexander's conquest of the Persian empire. Not only were new gods such as Isis and Serapis absorbed, but the pattern of worship changed in response to new political realities: Greek cities came to terms with the powerful and distant rulers of the Hellenistic kingdoms, or with the growing power of Rome, by integrating them in their pantheons as gods.

Religious Brotherhoods

Missionary organizations in 20th-century Greece

Religious brotherhoods constitute an important feature of religious life in 20th-century Greece. Their appearance was due to the inability of the official Church to deploy a necessary missionary programme in the country. Their spiritual antecedents must be sought in various religious movements in Greece from the late 18th century onwards, which originated out of private initiative and remained in tension with the Church. The best-known brotherhoods are Zoe ("Life"), Sotir ("Saviour"), and Stavros ("Cross"), but there are some recent ones too (e.g. Lydia). Though there are several notable differences between them, they have some common characteristics.

The most influential brotherhood has been Zoe. It was founded by archimandrite Evsevios Matthopoulos (1849–1929) in 1907 in Athens. Its initial nucleus consisted of theologians and a few working men. The purpose of Zoe was the spiritual growth of its members and the expansion of Orthodoxy all over Greece. Its eponymous journal has been published regularly since 1911. Zoe was a semi-monastic organization and its members, some clerics but mostly lay theologians, had to accept the monastic vows of chastity, poverty, and obedience while living a cenobitic life. However, Zoe did not retreat from the world, but was based in urban centres across the country, engaging in religious activism in order to transform Greek society.

Zoe expanded rapidly and soon needed a more effective organization. Between 1927 and 1947 its influence all over the country under the leadership of archimandrite Serapheim Papakostas was impressive. Its many-sided activities included the publishing of the Bible, religious books, and journals; preaching, Sunday schools, and Bible study groups; charitable work; summer camps; various affiliated sisterhoods of devoted celibate women and numerous other associations for various social groups (e.g. parents, students, workers). In this way, Zoe brought about a revival in Greek religious life, which left its imprint in the years to come. After the end of World War II and the ensuing Civil War (1946–49), Zoe contributed to Greece's restoration. With the support of the state and the help of the "Christian Union of Professional Men" and its monthly magazine *Aktines*, edited by the law professor Alexandros Tsirintanis, its activities were incorporated in the 1950s into a broader quasi-messianic vision of creating a wholly new Orthodox Greece within the frame of a "Helleno-Christian Civilization". This led to the culmination of its power and prestige in that decade.

Between 1958 and 1960, however, an internal split appeared within Zoe. Three of the oldest founding members, including P. Trempelas (1886–1977), professor of theology at the University of Athens, decided to leave Zoe and create a new brotherhood, Sotir. Sotir claimed a return to the authentic spiritual heritage left by E. Matthopoulos and exhibited more conservative orientations than Zoe. Despite initial difficulties, Sotir managed to develop a stable organization and to expand its activities across the country. However, this schism had a negative impact upon the brotherhoods' influence. Numerous previous members dissociated themselves completely from them and criticized them for deviating from the true Orthodox tradition.

In the case of the brotherhood Stavros, things are different. It appeared first in 1959 and in a more organized form in 1966. Its founder was archimandrite Avgustinos Kantiotis, who in 1967 became bishop of Florina. Born in 1907, Kantiotis undertook extensive missionary activity in many dioceses and made headlines with his militant and uncompromising views on issues pertaining to Orthodox dogma and ethos. As a result, his conflicts with Church and state officials were numerous, but he did not change his attitude even after his elevation to a bishopric. Stavros has been influenced to a certain extent by Zoe, but exhibits some differences too. Kantiotis's charismatic personality remained of paramount importance for his movement, while the other brotherhoods were not dependent on one particular person. Furthermore, Kantiotis's critique was fierce and fanatical, whereas the other brotherhoods were generally milder in their overall attitude. Finally, as far as the Lydia brotherhood is concerned, it is based in northern Greece and was founded by archimandrite Theophilos Zisopoulos.

The most serious problem of the brotherhoods has been their relationship with the official Church. Although they belonged to the Church and their founders were Orthodox clerics, the Church hierarchy has always been critical of their independence, their social influence, and their elitism. In addition, the official Church organization for internal mission, the Apostoliki Diakonia ("Apostolic Service"), became active from the late 1940s onwards; in other words, relatively late in comparison to Zoe, which had been far more successful. Various accusations were brought against Zoe as early as 1914 and later in 1923, but without repercussions. The "cold war" between the Church and Zoe continued. Serious criticism of the brotherhoods appeared after the split between Zoe and Sotir, and was made known to a wider public through newspaper articles and the media. The brotherhoods were labelled as sectarian, puritanical, pietistic, and activist movements, modelled upon western religious orders such as Opus Dei. They distanced themselves from authentic Orthodoxy and

genuine ecclesiastical life through their independence from parish life and the local bishops. They were regarded either as being parasitic upon the Church or as lying entirely outside the Church body. Their political preferences and social conservatism, manifested in their general support of the military junta (1967–74) and of the policies of archbishop Ieronymos Kotsonis, a former Zoe member, provoked biting criticism. The brotherhoods were accused of attempting to control the Church and holding politicians under their religio-ideological influence. More recently, the brotherhoods were officially held responsible for spreading fundamentalist attitudes within the Greek Church in various long-standing violent conflicts, as manifested in the diocese of Larissa.

The brotherhoods have tried repeatedly to refute these accusations and show their historical roots in the Orthodox tradition. They have pointed to their contributions to Greek religious life, especially regarding the revival of sacramental practices and mission. They have also emphasized that their members remain in the Orthodox Church, since there has never been a schism between them. Clerics belonging to the brotherhoods are employed in several dioceses across the country. Their sectarian features (e.g. elitism, pietistic morals, tension with the surrounding secular culture) have not yet transformed them into full-fledged sects. Their intention to remain within the Church is evident in many ways. After all, Stavros's founder and leader A. Kantiotis is an Orthodox bishop. Two other eminent and learned hierarchs, the archbishop of Albania, Anastasios Yannoulatos, and the bishop of North and South America, Dimitrios Trakatellis, were previously members of Zoe. Nevertheless, the brotherhoods' independence and elitism may eventually lead them to separate from the Church, especially if they think that the Church is making dangerous compromises regarding the Orthodox faith. The emergence of Old Calendarists in 20th-century Greece through a schism shows that such developments can happen.

Renaissance, Palaiologan

During its politically weak and socially decadent final two centuries (1261–1453), the Byzantine empire underwent a cultural renaissance that revitalized art, architecture, philosophy, music, religion, and other manifestations of the intellect and spirit. This flowering, a true renaissance fostered by Byzantium's last dynasty, the Palaiologoi, crucially influenced the Italian Renaissance and so all subsequent western culture. The Orthodox Balkans and Russia, whose conversion and religion depended on the Greeks, have a strong Byzantine character to this day, and the Palaiologan achievement properly includes their art. Many monuments and objects of Palaiologan art and religion (these two were the same to them) remain, though they represent a mere fraction of what was produced by the imperial workshops and under private patronage (what Greeks called the "poetic" cause). These prove that the empire's final weakness was political and financial only, and that under the Palaiologoi Byzantine culture was not at its last gasp, as older historians, following Gibbon in his magisterial *The History of the Decline and Fall of the Roman Empire* (1776–88), tended to assert, but rather in a period of spectacular renewal till near the end. Greek high culture thus evolved for more than 2,000 years without a break.

Byzantine culture properly begins during the reign of the emperor Constantine the Great (died 337), who made it eastern (based on Constantinople) and Christian. Thus Byzantium developed a culture that was compounded of Classical and oriental elements, with an emperor as its heart and a patriarch as its soul. In this, Palaiologan culture is no different from that of Justinian's age. Though the Fourth Crusade, in 1204, was a disaster from which the Greeks never fully recovered – Venice carried off so much booty that its artistic tradition remained Byzantine for 250 years – from the embers the Palaiologan dynasty eventually rose in splendour. Michael VIII Palaiologos (1259–82), scion of an old Byzantine family, reconquered Constantinople in 1261 and, despite

reduced circumstances, undertook the restoration of houses, fora, market places, theatres, law courts, and churches, and encouraged the astonishing late flowering that we rightly call the Palaiologan Renaissance.

In ways unavailable to the West, this renaissance was a continuation; Greek intellectuals did not have to discover Plato and Euripides, for they had never forgotten them. And there was no Byzantine century without poetry, history, theology, and the copying and illuminating of manuscripts. The Italians, for their revival, were dependent on Byzantium for their Hellenism, just as the Byzantines had to look to the West for military succour, which never came, though several Palaiologan emperors were ready to submit to Rome for it.

Intellectual activity remained much higher in Byzantium than in the West. George Pachymeres (died *c.*1310) , for example, wrote a *Roman History*, a 13-volume work that is accurate and emphasizes the theological nature of recent events. He also composed a theological treatise on the doctrine of the Trinity. His collection of lectures (*Compendium of Four Mathematics*) on mathematics, music, geometry, and astronomy, which became the standard academic text in Byzantine culture, was one of the first to use Arabic numbers, and his compendium of the philosophy of Aristotle was also for school use. Theodore Metochites' *Philosophical and Historical Miscellany* is an encyclopaedic collection of tracts and essays on Classical thought, history, and literature, comprising more than 70 Greek authors; he also produced treatises on physics, astronomy, physiology, and Aristotelian psychology. His commentaries on Plato's *Dialogues* were an important influence on Neoplatonic thought, and his *Embassy Papers* an invaluable history. The emperor John VI Kantakouzenos (1341/47–54) retired to a monastery to compose his *Histories* and theological works. Their volume and quality are astonishing.

Byzantine art had always striven to reflect the divine shadow on earth, and to open a window on heavenly permanencies and the theological mystery of transcendent reality. Severely Platonist, it sought the divine lineaments, usually as a setting for the liturgy; secular art, though it existed, was minor. The art of the Palaiologan Renaissance, as developed in mosaic, fresco, and icon-painting – to say nothing of ivory carving, liturgical music, and textiles – continued this, but was gentler than its predecessor; it strove to please and observe as well as to inspire, and so is easier for us to enjoy.

Probably the greatest surviving masterpiece of Palaiologan art is the church of St Saviour in Chora at Constantinople, also known by its Turkish name, the Kariye Cami. Michael's son and heir, Andronikos II Palaiologos (1282–1328), was not fierce and calculating like his father but rather amiable and intellectual; he fostered the golden age of the great monastery complex on Mount Athos. One of his chief ministers, the same rich and pious scholar Theodore Metochites (died 1332), had the church built and decorated to his own excellent, classicizing taste. It is full of glittering mosaics of the highest quality, one of which shows Theodore himself in an immense oriental hat and rich robe offering his church to Christ. But perhaps the church's high point is the Resurrection fresco in the side chapel. These works, while they maintain traditional spiritual power, are replete with humanism, colour, movement, and narrative, attributes often associated with the Italian Renaissance.

After the plague of 1346 killed a third or more of the population of Constantinople, such an expensive, elaborate project was not attempted again; civil war and foreign threats worsened the situation. With the rise of the Ottoman Turks, Byzantines could see the end coming, and their art and thought turned inwards. Icons, often for personal adoration, now became the chief mode, and the one that best continued the tradition after the fall.

This inward turn was intensified by heschyasm, the religious cause célèbre of the day. Though inextricably intertwined with politics in the violent Byzantine way, this quietist doctrine became dominant on Mount Athos and its chief apologist, Gregory Palamas, was canonized. As the empire grew poorer, Athos's monasteries grew richer, and much Byzantine scholarship, so coveted by the West, was encouraged and preserved there. There frescos were painted, church decoration schemes formalized, and Byzantine chant developed to its present form.

Constantinople was not the only venue for the Palaiologan Renaissance. The prosperous city of Thessalonica was always an artistic centre. And the empire's last outpost was at Mistra in the Peloponnese, whose churches with their elaborate brickwork and richly coloured frescos can still be visited. The jewel of Mistra, however, was the philosopher Gemistos Plethon, who was celebrated throughout Europe; the manuscript of his last work, a strange amalgam of Christianity, Platonism, the Classical pantheon, and Zoroastrianism, was destroyed on his death in 1452 for its dangerously baffling thought.

When the peaceable sultan Murad II was succeeded by his brilliant and bellicose son Mehmet II (1451–81), the end was inevitable. On 29 May 1453 Constantinople fell for ever. No more a separate entity, its civilization became an element, indeed a crucial element, in the emerging culture of the West. The last emperor, Constantine XI Palaiologos (Odysseus Elytis hymned him as "the last Greek"), went down heroically fighting alongside his people; his body was never found.

Renaissance, Veneto-Cretan

The successful colonial development of Crete by the Most Serene Republic of Venice from 1211 until 1669 overlapped culturally with the period of the Renaissance in Italy. The island consequently became one of the most significant locations in Greek lands where new Western developments penetrated into the visual arts, literature, and music. The townscape of the capital city Candia (modern Herakleion) was soon developed into a vista of churches and houses of Gothic and Renaissance appearance, and the other two major ports of Rethymnon and Chania (called La Canea) were equally visibly westernized, and endowed with ornamental fountains and other amenities. The Venetian possessions in previously Byzantine lands after the Fourth Crusade had disrupted the empire in 1204 were, of course, extensive, but Crete, particularly after the fall of Constantinople in 1453, acted as a key cultural centre, and, through its maritime connections with Venice, was the recognized place of transit for Byzantine refugees and scholars between Byzantium and Italy.

An issue in understanding the westernization of Cretan painting is to what extent artists travelled backwards and forwards between Candia and Venice and to what extent western objects and artists came to the island. Precise information on artists, artist objects, patronage, and the intermarriage of Cretans and Venetians is available in the notarial archives of the dukes of Candia who, under the treaty of 16 September 1669 between Francesco Morosini and the Ottoman Turks, were given the concession of transport together with other valuables to Venice. The continuing study of these documents has allowed more precise discussion of the working practices and nature of artistic organization in Crete than in any other Byzantine or Hellenic community. Equally the existence of the Greek community in Venice which maintained contacts with Crete gave a permanent place in Italy where itinerant artists could expect support and patronage. From the archival documents we can construct a time sequence of the main artists and their families who worked in Crete (and some in Venice and elsewhere in Italy as well). Some of the most prominent names over the period are Nicholas Philanthropenos (active 1375–1440), Angelos Akatantos (*fl.*1436–*c.*1457), John Akatantos (*fl.*1435–77), Andreas Ritzos (1422–*c.*1492), his son Nikolaos Ritzos (*fl.*1460–*c.*1507), his son Maneas Ritzos (*fl.*1528–54), Andreas Pavias (d. after 1504), Nikolaos Tzafouris (d. before 1509), Angelos Bitzamanos (1467–1532), Theophanes Strelitzas Vathas (often known as Theophanes of Crete, *c.*1490–1559), Michael Damaskinos (1530/35–92), Georgios Klontzas (*c.*1530–1608), and El Greco (Domenikos Theotokopoulos, *c.*1541–1614). But there are many more documented artists, both during this period and in the 17th century. What is important for the Veneto-Cretan Renaissance is that these names can be connected with extant works, many with signatures, and so can be appreciated as distinctive artistic personalities during the period. This means that in Crete we can characterize the architectural nature of the built environment, both secular and ecclesiastical; we can track the careers of icon painters, manuscript painters, and wall painters; and we can also see how Cretan artists spread their ideas both as a result of other commissions in the Orthodox world (the most notable case being the wall paintings and icons of Theophanes the Cretan and his sons in monasteries at Meteora and Mount Athos) and through sales of icons in Italy and elsewhere in western Europe (some mass-produced in Crete and exported).

Politically Venetian Crete was administered by a governor, the duke, based in Candia. This was a short-term post for two or three years only, after which the holder was expected to go back to Venice. A high proportion of Cretans remained loyal to their Byzantine past and traditions, and although the Venetians expelled the bishops, the Orthodox parish churches and monasteries were maintained and developed, even if stripped of their estates. The head of the Christian Church in Crete was the Latin archbishop. Orthodox priests could be ordained only outside the island and the movement of monks and priests was controlled. Venice after the Council of Florence of 1439 tried to impose on Crete the union of the Orthodox and Catholic Churches, but while their efforts were in the long term unsuccessful such activities are reflected in a number of works of art of this period that ostentatiously merge Byzantine and Renaissance styles and subject matter (for example a panel by Andreas Ritzos of the monogram IHS, standing for *Jesus Hominum Salvator* (Jesus Saviour of Men), the emblem of the Franciscan saint Bernardino of Siena (1380–1444) who was notable for his attempt to unite the Churches). While institutionally the attempted unification of the Churches was a failure in Crete, in cultural terms the westernization of Byzantine art which became so conspicuous a feature of the products of Cretan artists did radically transform the character of Orthodox art.

It is also clear that, despite the failure to unify the Churches, congregations in the Catholic and Orthodox churches on the

Veneto-Cretan Renaissance: church of the Arkadi monastery near Rethymnon, built in 1587

island were mixed, with Catholics present at Orthodox services. Catholic churches no doubt contained decorations carried out by Cretan artists and both Latin and Greek inscriptions are found on Cretan icons. Renaissance musical settings for the Mass, religious processions, and secular occasions were composed on Crete. The demography of the island inevitably became less polarized over the course of the period. When the Venetians took over at the beginning of the 13th century, the island was divided up into large estates owned either by the Greek aristocracy (*archontes*) or by the Orthodox monasteries. This situation soon changed (despite some opposition), and by 1300 the countryside had been organized into four administrative districts which consisted of properties now in large part owned by Venetian colonists who had been given land in return for military duties. Cretan society had now developed into four categories: *nobili veneti*, the Venetian colonists; *nobili cretensi*, the new assimilated group of intermarried Venetian and Greek aristocracy; a bourgeoisie; and the peasants. The Latins preferred to live in towns, and so village churches remained Orthodox. With few exceptions, new church buildings in the villages were relatively small, usually with barrel vaults over the nave; western architectural features might occur in the exterior in the window mouldings or architectural carvings, particularly on the apse. The buoyant nature of patronage is shown in western Crete by the fact that eight churches were decorated there between 1313 and 1347. The work was entrusted to one artist who signed the wall-paintings as John Pagomenos.

The architectural development of the cities was substantial (and has only become less obvious today through earthquake and war damage and through neglect and destruction in the first half of the 20th century). Candia was dominated by the spire and high Gothic nave of the church of San Marco (now St Mark's Hall, converted from use in the Turkish period as a mosque), and in front of this church has survived the fountain built by Morosini the Elder in 1626–28. Other important churches were those of St Peter and St Titus. The inner harbour is guarded by the Venetian fortress (1523–40), and the 16th-century arsenals have survived (the Venetian loggia is a modern reconstruction). The Venetian population could describe their city as having a Palazzo Ducale and Palazzo del Capitan Generale on the Piazza del Biada, while on the Piazza del Signore were the Palazzo del Capitan Grande and the Loggia. The third piazza contained the church of San Marco. The Venetians built the imposing walls and fortress at Rethymnon (the latter was constructed in the years 1573–83 by the Venetian engineer Pallavicini), and they fully developed Chania with a cathedral, rector's palace, walls, and bastions, and with a protected harbour and arsenal. These ports became ostentatious Venetian fortress cities, but the vocabulary of

Renaissance architectural forms spread throughout the island also as a result of church building. This operated in two distinct ways. First, as a result of the encouragement of missionary activities to convert Cretans to Catholicism, impressive churches were built over the island to house the monastic orders (Franciscans, Dominicans, and Augustinians). The Dominicans built St Peter Martyr close to the port of Candia, and its surviving shell shows that it was a large single-naved church with a flat sanctuary, pointed wooden roof, and ribbed vaults. The rich church of St Francis at Candia disappeared in the Turkish period, and the mendicant church of S. Salvador where many prominent Venetians were buried was demolished in 1970, but the smaller church of St Mary of the Crusaders has survived and indicates the nature of a simple Italianate church of the early Venetian period. The monuments of Chania give a much better record of the Italian workmanship of the period, with the Dominican church of St Nicholas (*c.* 1300), San Salvador, and the church of St Francis (now the archaeological museum) which is a grand church of the 14th century (and later additions) with rib vaults, capitals, and a bell-tower with window tracery, closely copied from Venetian models. The second way in which the environment was westernized was through the adoption by Orthodox monasteries and other civic buildings of the ornamental and structural features of Italian architecture: the west front of the church of the Arkadi monastery (near Rethymnon) built in 1587 is a complex mix of Classical orders and Renaissance ornamentation, and on the Akrotiri peninsula near Chania both the monastery of Hagia Triada (built in the 17th century by two Venetian monks of the family Zangaroli who had converted to the Orthodox faith) and the Gouverneto monastery of St John are built in stone with Renaissance mouldings and Classical façades.

The atmosphere of the Veneto-Cretan Renaissance is therefore consciously proclaimed by its Italianate civic environment, but the intellectual climate was equally strongly influenced by humanist interests, communicated in part through the new printing presses of Venice and the development of literary societies or academies in each of the three main cities of Crete. All Cretan writers used some form of the vernacular, and in their poetry and prose covered a range of modes. The masterpiece of religious drama is *The Sacrifice of Abraham*, a short and very popular play in rhyming couplets, generally attributed to Vitsentzos Kornaros (1553–1613/14), who was also the author of a poetic romance, the *Erotokritos*, in which the two separate strands of Greek and Western narrative fiction have been described as coming together. From the same period of production comes the *Erofili*, a classicizing tragedy of 3205 verses written in Rethymnon around 1600 by Georgios Chortatsis. The miniature drama *Fortounatos* by Markos Antonios Foskolos (1597–1662) supplies a literary work from this period by a writer of Venetian origin and Catholic faith who in language and culture was integrated with the Greek-speaking majority.

While the literary scene flourished in the last century of the Venetian period, the pace of the transformation of the pictorial arts in Crete can be succinctly measured over the whole period. In the initial phase of conservatism the 14th-century wall-paintings of the church of Panagia Kera at Kritsa exhibit a strongly traditional nature; they relate closely in style to such Byzantine works as the Peribleptos church at Mistra in the Peloponnese. Among the innovators of the 15th century, one of the most prolific artists was Angelos Akotantos (whose career is well documented in his will of 1436 which is preserved in the Venetian archives). He worked in Crete and visited Constantinople, and among his signed icons ("Hand of Angelos") are paintings in both a decorative Byzantine style and also a more narrative and naturalistic style which exhibits a knowledge of Venetian and Tuscan quattrocento interests in landscape and perspective. Other 15th-century artists show a considerable ability to use Italian themes and expressive forms. A century later, when the literary scene was so highly prominent, the paintings of Michael Damaskinos and the young El Greco, who both worked in Venice as well as Crete, fully integrated the developments in colour and tone of Venetian Renaissance artists, while their contemporary Georgios Klontzas worked in a more miniaturist and decorative manner.

The Veneto-Cretan Renaissance was a reflection of contact with the Italian Renaissance and not a separate autonomous movement. It came to an end with the departure of the Venetian colonists. However, the result of eastern contacts with the west in this impressively creative environment was permanently to transform eastern Christian art into a new form of expression and to change the horizons of Orthodox society and thinking. As a cultural unit on the periphery of the Renaissance world, Crete selectively appropriated Italian ideas, and thereby also offers a contemporary critical assessment of the values of that Renaissance.

Republic

Meaning a political system in which supreme power is vested in the people, a republic is the modern equivalent of an ancient democratic city state. Since the birth of the modern Greek state in 1830 experience of republican government has been considerable, but interrupted. There were declarations by Greek national assemblies in republican directions even before the establishment of the Greek state, during the War of Independence. Hence the period of the War of Independence and the first years in the life of the new state have been regarded as the First Republic (1821–32). Despite clear indications of an increasing preference for a republican model, geostrategic realities, foreign influences, and the complex domestic situation eventually led to the imposition of monarchy in 1832. After the 1830s, however, it became evident that different sociopolitical factions championed different models of government. Those who aimed to initiate a process of state-building in the western tradition pushed for a centralized state with strong executive and rationalized administrative structures. On the other hand, those who wished to retain the power of local notables had a preference for more decentralized governmental structures.

The westernizers prevailed in the end, despite the power of the conservative local oligarchies. Still, the state apparatus soon became colonized by the so-called *tzakia*, influential families whose origins can be traced to those local notables (*proestoi*) who had played a critical role during the War of Independence. By and large, the *tzakia* increasingly favoured a loose parliamentary model, since the latter, adapted to 19th-century Greek conditions, would simultaneously constrain the capacities and the reach of central authority and assist the patrician families to strengthen their role in the state, based on their local power resources and their extensive presence in parliament. In 1875 the king accepted the parliamentary principle in government formation, against the background of the liberal constitution of 1864 and of the early (1844) declaration of parliamentarism. The balance thus achieved survived until 1909, when a coup set in motion developments that favoured the ascendancy of liberal statesmen and the prevalence of liberal institutions. The formation of a modernized and operational political system, a rationalized bureaucracy, and a professional army was a slow and difficult process, and it was not until the 1920s that the Greek state can be said to have acquired modern structures of government.

The political regime of the Second Republic (between 1924 and 1935) represents a remarkable combination of a liberal institutional edifice and political uncertainty. The revision in 1911 of the Constitution of 1864 had as a main objective the establishment of a modern constitutional state based on respect for parliamentary government and the rule of law. In brief, there were strong liberal elements in the Constitution of 1864/1911 and these were extended and acquired a republican form in the Constitution of 1927. Venizelos, the liberal statesman, aimed to steer the Second Republic towards liberal consolidation on the domestic front and in foreign policy. In 1930 Greece and Turkey signed the Atatürk–Venizelos agreements, which were largely the culmination of Venizelos's efforts to put an end to the irredentist drive, which had suffered a massive blow in 1922 with Greek defeat in Asia Minor and the expulsion of the Greek population, and to redirect Greek policy. At the same time, the Second Republic bears the marks of the conflict between the republicans and the royalists, a conflict that acquired considerable dimensions and became a crucial parameter in Greek politics in the early decades of the 20th century (see Mavrogordatos, 1983). One aspect of the legacy of the cleavage over the regime was the politicization of the military, which participated in various royalist or republican coup and counter-coup activities throughout the early decades of the century (see Veremis, 1997).

The restoration of the monarchy after World War II and the Civil War took place in a context of political turmoil and institutional uncertainty. It was only with the Constitution of 1952 that a new institutional equilibrium was reached, based on the consolidation of a political regime with several authoritarian aspects. The Constitution of 1952 was, in many respects, "an authoritarian version of the liberal constitution of 1864/1911" (Alivizatos, 1979). First, it was based on and confirmed a political regime that excluded the left, mainly through the extension of various measures and decrees from the period of the Civil War into the postwar period. Second, it provided for a strong executive which was later used in another direction, namely the conservative modernization efforts of the late 1950s and early 1960s under Constantine Karamanlis (Charalambis, 1985). The Constitution of 1952 remained in place until 1967, when a military coup installed an authoritarian regime. The coup was apparently aiming to block the possibility of a centre-left government emerging from the planned elections of 1967. The regime's attempts to institutionalize itself proved unsuccessful. The main feature of the regime was "a blind and militant anticommunism and a conscious attempt to secure its political base by resuscitating the polarization of the civil war. Its dismal failure was due as much to its anachronistic message as to the inability to appreciate the enormous transformation that Greek society had undergone since the 1940s" (Diamandouros, 1995, p.287). The authoritarian regime collapsed in 1974 amid foreign-policy crisis and domestic upheaval.

The Third Republic (since 1974) represents the most successful period of sustained democratic government in the history of the modern Greek state. In 1974 a referendum abolished the monarchy, whose ambivalent role in domestic politics in the 1960s was widely seen as a crucial factor in causing the political instability that paved the way for the coup in 1967. The republican Constitution of 1975 is a modern democratic constitutional document. From the perspective of a comparison with similar documents in countries that went through comparable political processes in the 1970s, such as Portugal, the Greek constitution included aspects that manifest a clear break with the recent past without necessarily incorporating elements that marked the particular mode of regime change (such as the constitutional role of the Council of the Revolution in the Portuguese Constitution of 1976, which was later amended). The authoritarian potential in conservative rule having exhausted itself, the new equilibrium which was reflected in the 1975 Constitution allowed the operation of liberal institutions, lifted the ban on the communist left, and sought to reorient the role of the military in the political system. But there were also elements of continuity with the

situation before the coup. The emphasis on a strong executive essentially represented a continuity from political and institutional strategies before 1967, only this time the organization of relationships between the head of state, the government, and the parliament revealed the influence of French semi-presidentialism. Also, the regime change in 1974 did little to challenge the inherited corporatist structures which govern the participation of organized interests in the making and implementation of policy. The transformation of interest politics was gradual and took place in the 1980s and 1990s through the shifts and the revisions in the structures of policy making and collective action, largely as a response to the process of Europeanization (see Lavdas, 1997).

The limited constitutional revision of 1986 eliminated most of the extensive powers of the president of the republic. Despite its opportunist aspects, which reflected the government's political priorities, the limited constitutional revision of 1986 marked an important shift in the institutional balance of power. The revision's institutional net result has been to enhance further the role and powers of the prime minister and to constrain the president of the republic, whose role became largely ceremonial. To some extent, the revision was consistent with the socialist (PASOK) analysis of the 1975 Constitution arming the president with extensive powers and distorting parliamentarism. It can be argued that the revision reduced the president's capacity "to exercise initiative in moments when it is most needed, that is, during political uncertainty or crisis", while at the same time helping to create a unitary power circuit centring on a powerful prime minister and his government majority (Diamandouros, 1995, p.295). In this sense, the revision represented an unnecessarily drastic reduction of the powers of the head of state. A more reasoned revision might have resulted in a more efficient organization of constitutional relationships.

Under the Third Republic Greece has been able to reach considerable levels of affluence and political stability. The processes of democratization and Europeanization led to changes in the practice of government in terms of both form (governmental and administrative structures) and content (public policies). Since 1981 membership in the EC/EU has given a new sense of direction to the Greek state. New orientations in public policy have included the spatial reorganization of government and the emergence of a new pluralism of policy-making centres at various levels: local, regional, national, European. It can be argued that, despite rhetorical assurances to the contrary, the political system has been slower to respond to the process of Europeanization in comparison to the economic and even the administrative and policy-making systems. Persistent clientelist linkages have resulted in parties and political leaderships often being unable to set priorities and act in a coherent way. On the other hand, both PASOK and New Democracy have been able to avoid extensive fragmentation and, crucially, have been able to play reasonably well their institutional roles in government and in opposition since 1974. More generally, republican government has ceased to be a divisive issue. Against the background of a successful regime change in 1974, the Third Republic has been able to consolidate itself as a modern democracy.

Rhetoric

Rhetoric is commonly understood to have to do with persuasive speaking – when, that is, it is not thought of as verbal deception or coercion. It is important to realize, however, that

rhetoric has a long and complex history as a discipline taught in schools and as a way of doing things with words in the public sphere.

As a cultural practice, the resolution of disputes and the formation of policy decisions by means of discourse can be traced back to preliterate Greek society, as is evident from numerous episodes in epic poetry, for example the assembly early in book 2 of the *Iliad* and the debate at the beginning of *Odyssey* 2. From these it is clear that there were strict conventions governing the conduct of debates, and of what was considered adequate and relevant evidence. From the mid-5th to the end of the 4th century BC, one can see the development in Athens of competing systems for the teaching and practice of speaking persuasively in court and in public assemblies, where institutional frameworks had been erected in the wake of judicial and political reforms. An old tradition has it that the teaching of rhetoric began in Sicily; but it is clear that the earliest significant lessons were given in Athens by two non-Athenians, the so-called sophists Protagoras and Gorgias. We see, next, in Plato's *Gorgias* and *Phaedrus*, a scathing critique of sophistic teaching, which, in Plato's view, would include that of Isocrates. Plato's pupil Aristotle composed a systematic treatment of rhetoric which takes issue with Plato and the sophists alike. During this same period, independently of the others, Anaximenes of Lampsacus composed another handbook, the *Rhetorica ad Alexandrum*. Its orientation is quite pragmatic, but its origins and intended audience are not clear.

Reduced to their basic elements, the rhetorics produced in Classical Greece differ from one another in important ways. The sort of rhetoric taught by Gorgias, so it seems from Plato's testimony and from the *Encomium to Helen* attributed to Gorgias, gave almost unlimited power to the speaker, who used language as a means to condition the emotions of his audience to achieve its compliance. Plato, by contrast, allowed as legitimate only a rhetoric that communicated to its audience truth arrived at by means of dialectic. The rhetoric of Aristotle's *Rhetoric* is one based on a method of arguing from "what usually happens" – i.e. "probabilities" – using rhetorical syllogisms (*enthymemata*) to provide audiences with grounds for judgement on legal, political, and moral issues. For Isocrates, the teaching of rhetoric would produce eloquent speakers with the ability to bring about consensus (*homonoia*) among the citizens of the state. The Gorgianic and Platonic models are both unilateral and asymmetric, because the only function of the audience is to attend to the speaker. The Aristotelian and Isocratean models of the speech situation tend more towards a collateral relationship between speaker and audience; and it is the audience that provides the grounds for argument and makes the decisions. These four notions of rhetoric – all developed in the same place over less than a century – have persisted down to our own time, sometimes in competition with one another, with one becoming dominant at one time, another at another time.

Only Isocrates continued to exert any significant influence over succeeding generations in antiquity, and only in the context of a rhetoric curriculum that had been developed in schools all across the Greek world after the conquests of Alexander the Great as part of the standard programme of basic education, the *enkyklios paideia*. This curriculum, designed to train boys to succeed in a range of discursive activities from letter writing to diplomacy to the practice of political and forensic oratory, was the one inherited both by Cicero (see, e.g., *De Oratore*, 3. 23ff., 59ff., 86ff.; and *Epistulae ad Familiares*, 1. 9), who continued to dominate rhetorical education in the west until well into the 17th century, and by Hermogenes (d. AD 225), whose refined versions of it virtually defined rhetoric in the eastern, or Byzantine, tradition.

The school curriculum consisted of, first, a set of elementary exercises (*progymnasmata*) and, at a later stage, declamations on assigned questions, usually of a fictitious nature. The lessons that were inculcated and repeated performance aimed at producing "the good man skilled in speaking". The art, as it was taught, consisted of five parts: invention (the techniques for discovering arguments); arrangement (consideration of order and amplitude in making the argument); expression (deploying the techniques for composition and ornamentation); memory (techniques for remembering both one's own speech and the body of accepted opinions on every subject); and delivery (the rules for the control of voice and gesture). At the heart of the process of invention is the so-called *stasis* system, a methodical way of determining the issue in dispute – is it the issue of fact, of definition, or of quality? – and of developing appropriate argumentative strategies. Students were taught a standardized format for speeches, usually based on a conventional courtroom argument, that consisted of the exordium (in Greek, *prooimion*), or introduction; the narration (*diegesis*); the argument (*pistis*) and refutation (*lysis*); and the peroration (*epilogos*). With minor variations, this standard format persisted in school rhetorics, in both the Latin and Greek traditions, throughout late antiquity, the Middle Ages, and the Renaissance.

To the school curriculum, Cicero (or perhaps his rhetoric masters) added a philosophical dimension borrowed from Academic scepticism as taught by Carneades, the idea that, in the absence of certain knowledge, it is necessary to be able to produce the arguments on both sides (*in utramque partem*) of an issue. An issue addressed by this "multivoiced method" (*multiplex ratio dicendi*), *controversia*, is resolved only in so far as one decides to adopt one of the positions in conflict as having more *probabilitas* or to modify it or to formulate a new position. It is precisely this method that Cicero uses in *De Oratore* and in such philosophical works as *De Natura Deorum*. As with Isocrates, "philosophy" is assimilated to rhetoric.

The persistence of the Isocratean–Ciceronian tradition in the west is evident in such works as Augustine's *De Doctrina Christiana* (completed *c.*AD 325), the last book of which is devoted to the principles of eloquence in a Christian setting; the brief dialogue on rhetoric composed by Alcuin (*c.*800); and the many handbooks on preaching, letter writing, and poetic composition that were in circulation during the later Middle Ages. In the east we find the tradition of Greek eloquence as defined by the likes of Isocrates and Demosthenes and systematized by Hermogenes in the productions of the so-called Second Sophistic, the works of Church Fathers, and in Byzantine diplomatic and court literature up to the fall of Constantinople in 1453.

As Christianity moved from being a persecuted sect and became the official religion of the Roman empire under Constantine, rhetoric became the vehicle both of public policy

and of religious discourse. Perhaps the most important figure in the reconciliation of Classical rhetoric and Christianity was the 4th-century theologian Gregory of Nazianzus, who became in the Byzantine world the model of Christian eloquence. Commentaries on Gregory's speeches appear as early as the 6th century; and Byzantine commentaries on Hermogenes regularly cite passages from Gregory. John Chrysostom ("The Golden-Mouthed"), roughly contemporary with Gregory, was perhaps the most prolific of the Church Fathers; and his homilies were likewise looked upon as models.

During the late 10th and early 11th centuries there was a surge of scholarly production in the field of rhetoric, partly due to the recovery of near-forgotten texts under Constantine VII Porphyrogennetos and the consequent need for new commentaries. In this, John Sikeliotes and John Doxapatres (both late 10th or early 11th century) were probably the most productive and influential scholars, producing extensive commentaries on Aphthonius and Hermogenes. (Byzantine rhetoricians were not much interested in Aristotle's *Rhetoric*.) Rhetoric played a central role in the imperial court from the 11th century on, and the office of *maïstor ton rhetoron* (director of the rhetoricians) became one of the most prestigious in the bureaucracy.

Byzantine Greek rhetoric arrived in the west even before the fall of Constantinople, smuggled in, as it were, by George of Trebizond (1395–1472), who used Hermogenes extensively (but cited him seldom) in his *Rhetoricorum Libri Quinque*. But it was after the fall that the deluge of Greek rhetorical manuscripts truly began; and Aldus Manutius' publication of the two-volume *Rhetores Graeci* in 1508/09 guaranteed that Greek rhetorics would be widely disseminated throughout Europe. The Reformation played an important role in this too. Frankiskos Portos's editions of Hermogenes and of Longinus (Geneva, 1569), Sturm's editions and commentaries on Hermogenes (Strasbourg, 1570, 1571, 1575), and Margounios's 1595 Augsburg edition and translation of the *Epitome of Rhetoric* by Matthaios Kamariotes (d. *c.*1495) were all part of a short-lived programme to provide the foundations for a counter-curriculum in Protestant schools.

By the beginning of the 17th century Greeks were teaching rhetoric in the College of St Athanasios in Rome and at Padua to the many Greek students who, in the absence of such opportunites in Greece during the Tourkokratia, were sent there by their families. These teachers sought to achieve a synthesis of the Latin western and Greek eastern rhetorical traditions, and the results can be seen in, for example, the bilingual sermons of Cyril I Lukaris (d. 1638) and in the *Techne Rhetorike* (Art of Rhetoric) by Theophilos Corydalleus (London, 1625). Corydalleus (1565–1646) turns for authority to both Aristotle and Cicero in his exposition.

Rhetoric was also taught at the Flanginian Academy in Venice, founded in 1626, where, likewise, Aristotle was read alongside Cicero and Hermogenes. One of the teachers there, Frankiskos Skoufos (1644–97), drew upon his experience of Classical authors, Church Fathers, and Byzantine writers in composing his *Techne Rhetorike* (Art of Rhetoric, Venice, 1681). Significantly, he borrows also from the *De Eloquentia Sacra et Humana* of the Jesuit Nicolas Caussin and from the sermons of Segneri and Bossuet. The organization of the book is fairly conventional. Book 1 contains introductory matters and the fundamentals of invention, drawing on, among others, Aristotle's *Topics* and doctrine of four causes. Book 2 treats of arrangement, taking each part in order. Book 3 is on style, with copious attention to metaphor and the other tropes. Book 4 continues the subject, treating at length the figures of speech and figures of thought. These latter two books make up well over half of the treatise as a whole. Book 5 treats, comparatively briefly, memory and delivery. All of this theoretical doctrine was given life in the practice of Corydalleus's student, Elias Miniates (1669–1714), one of the most famous preachers in the history of Europe.

Rhetoric, Skoufos writes, is the art of speaking well in such a way as to agitate the souls of the hearers (*Techne*, 1. 2). This conception of rhetoric is in full correspondence with other 17th-century works on the subject that, in the wake of Reformation and Counter-Reformation struggles and the relegation of morals to the realm of emotion by Cartesians and Empiricists alike, emphasized the centrality of affect, or feeling, in persuasion. Not that Skoufos neglects to treat of argumentation; but affect plays an immeasurably more important part in his rhetoric. This, in turn, explains why he draws almost indiscriminately from both Aristotle and Cicero, and holds Bossuet (whom he calls "the Gallic Hercules") and Segneri in such high regard. His goal, after all, is to give instruction on how to "move souls". Although training in rhetoric could prepare students for careers in law or government, the more intense interest in rhetoric centred on its use from the pulpit.

Many of the rhetorics produced by diaspora Greeks in the late 17th and early 18th centuries, consequently, have a distinctly homiletic focus. Gerasimos Palladas (d. 1714), who became patriarch of Alexandria, composed a treatise on rhetoric, as did Nikolaos Mavrokordates (1670–1730), who draws from Aristotle, Cicero, and St Ambrose. Anastasios Gordios (1654–1729) composed a rhetoric handbook for his students; and Ephraim the Athenian (d. 1771), metropolitan of Jerusalem, saw his rhetoric as a continuation of the tradition of the great Greek Fathers. Makarios Patmios supplemented his *Ekthesis Kanonon Rhetorikon* (Exposition of the Rules of Rhetoric, Venice, 1755) with *Evangellike Salpinx* (Evangelical Trumpet, Leipzig, 1758).

Rhetoric also continued to be taught at a more elementary level in general liberal arts curricula in schools all over the Balkans. In the National Library in Athens, for instance, there is a manuscript copy of the *Rhetorike Leucheimonousa* (White-Robed Rhetoric) composed by Anastosios Papavasilopoulos while he was teaching in Trnavo around 1700. It is a short introductory treatise composed in catechetical form that emphasizes not style, but invention. The Leichoudis brothers, Joannikios (1633–1717) and Sophronios (1652–1730), taught Latin and Greek rhetoric in a variety of schools, including one in Novgorod. Manasses Eliades (died 1785) lectured on the *Rhetoric* of Corydalleus and on Hermogenes at the Academy in Bucharest; and Països Paramythias (*fl.*1770) taught from his *Rhetorical Exercises* in schools in Moldavia, Hungary, and Corfu. Vikentios Damodos (1700–52), who had trained at the Flanginian Academy and at the University of Padua, composed at least three separate treatises on rhetoric for his students in Cephalonia, none of which was published in his lifetime. And Demetrios Darvaris, who studied philosophy at Halle and went on to become a teacher

in Budapest and Vienna, included a modern Greek rendition of Isocrates' *Pros Demonikon* (To Demonikos) in his *Guide to Happiness* (Vienna, 1796).

Rhetoric, in both its ecclesiastical and secular forms, continued to be taught during the Tourkokratia. The generation before the War of Independence recognized another important aspect of rhetoric, however – its role in the formation of national identity. It is no coincidence that authors of rhetoric texts such as Spyridon Vlantis (1765–1830) and Konstantinos Bardalachos (1755–1830) were also deeply involved in the publication and translation of major Classical and Byzantine poets, historians, and philosophers, and translations into Greek of some Latin writers as well (e.g. Vlantis's translation into modern Greek of Ovid's *Metamorphoses* (Venice, 1798). Most of them were also involved in the debates about the Greek language itself. Vlantis, who taught at the Flanginian Academy, produced several grammatical works in addition to his editions of Hermogenes (Venice, 1799) and Longinus (Venice, 1802); and so, too, Bardalachos, who published his grammar in Odessa in 1830, 15 years after the appearance of his *Rhetorike Techne* (Art of Rhetoric, Vienna, 1815). Coincidentally, it was also in 1830 that Konstantinos Oikonomos (1780–1857) published in St Petersburg his treatise on the correct pronunciation of Greek. Oikonomos had published a major work on rhetoric in Vienna in 1813, drawing on Aristotle, Cicero, and borrowing much from Hermogenes, particularly in the area of *stasis* and topics of invention.

However important rhetoric seemed to the founders of modern Greece, their successors found little place for it in schools. Greek education in the mid-19th century – and indeed, to this day – modelled itself on its European counterparts, particularly France and Germany. Rhetoric in Greece, as in those other countries, was not very prominent in the curriculum; and there are no chairs of rhetoric in Greek universities – as is the case in Europe generally. Yet the tradition clearly lives on in Greek literature and jurisprudence.

Rhodes

Island in the Dodecanese

The largest of the Dodecanese group of islands, Rhodes lies in the eastern Aegean a few miles off the southwest corner of modern Turkey. Habitation on the island extends back as far as the neolithic period, and pre-Greek and early Greek settlements are attested in the 2nd millennium BC. The Minoans, a highly civilized seafaring people from Crete, had founded a trading post at Trianda (on the west coast about 9 km south of modern Rhodes town) by the 16th century BC, and the Mycenaean Greeks who succeeded the Minoans as the main power in the Aegean appear to have established prosperous colonies on the island some two centuries later, judging from the presence of chamber tombs and rich finds from the cemetery near Ialysus (not far from Trianda).

After the collapse of the Mycenaean civilization, the Dodecanese islands were inhabited in the so-called Dark Age of Greece by Dorian-speaking Greeks emigrating eastward from mainland Greece. The island had various names in antiquity, but finally "Rhodos" (in Greek) became standard. Mythological legend held that Rhodos was the child of the sun god Helios and the nymph Rhoda. Other traditions associated it with the Greek work for rose, *rodon* (whether or not this etymology is true, the rose appeared as a symbol on Rhodian coinage in the Classical and later periods, and Rhodes is popularly known as "the Island of Roses" in modern times). Three city states were founded: Ialysus (see above), Camirus (also on the west coast some 35 km south of Rhodes town), and Lindus (about halfway down the east coast). These three cities are mentioned in the Homeric Catalogue of Ships as sending ships to the Trojan War (*Iliad*, 2. 656).

The cities flourished in the 7th–6th centuries BC and, like many other cities in archaic Greece, sent out colonies (Lindus founded Phaselis on the east coast of Lycia *c.*690 BC, and, in association with Cretans, Gela on the south coast of Sicily in 688 BC). The cities on Rhodes were on the whole ruled by tyrants from local aristocratic families. The most famous of these was Cleobulus of Lindus in the early 6th century BC, who was one of the "Seven Sages" – men renowned for their wisdom in political and practical matters – in Greek literary tradition (an impressive round structure on the headland just north of Lindus is traditionally known as the tomb of Cleobulus, but it is of pre-Hellenic date).

Rhodes was caught up in the political situation affecting the rest of the Greek world in the 5th century BC. In common with the rest of east Greece, the island became subject to the growing power of the Persian empire in 490 BC. After Greece – under the leadership of Athens – finally defeated the Persian empire in 479 BC, the cities of Rhodes, like most of the other Greek cities, joined the Delian League, a confederation of cities which paid tribute to Athens in return for protection against a possible new Persian threat (all three cities of Rhodes are recorded in the Athenian Tribute Lists). The Rhodian cities remained under Athenian influence until they revolted in 412/11 BC during the Peloponnesian War and switched their allegiance to Sparta. The revolt is often attributed to the encouragement of a prominent aristocrat from Ialysus named Dorieus, who had been exiled by Athens some years previously and had turned to Sparta.

The most important political event in the history of ancient Rhodes occurred in 408/07 BC, when the three independent city states formed a single community and founded a federal capital city, also called Rhodes, at the north tip of the island. The three old cities thereby lost their independent status, and together formed a single political unit run by federal officials and legislative bodies. The reasons for this dramatic political rearrangement are not known, but an economic motive seems likely. Rhodes island occupied an ideal position between east and west, and a city at the northern tip of the island provided easy access to both seas. The economic prosperity of Rhodes in years to come proves the wisdom of the synoecism. The old cities continued to be inhabited, had local governments, and controlled their own local religious cults, but, from now on, the capital city of Rhodes controlled the federated island's foreign policy.

The political life of Rhodes in the 4th century BC is complex. A revolt from Sparta in 395 led to the return of Athenian influence, despite continuing internal unrest, and within the next decades to the establishment of a democratic government which was the hallmark of Rhodes throughout the rest of its independent life. It was during the 4th century that Rhodes consolidated overseas territory and incorporated it into the Rhodian state. This consisted of the so-called *peraia* ("the land opposite"), the area of southwest Turkey immediately opposite Rhodes, as a result of which Rhodes gained a firm foothold in Asia Minor between Caria and Lycia. Various nearby islands were also incorporated (Chalki, Symi, Tilos, Nisyros, Karpathos, Kasos, and Megiste [Kastellorizo]). As an Athenian ally, Rhodes joined the Second Athenian Confederacy in 378/7 BC, but the growing influence of the Persian satrap Mausolus of Caria upset the political equilibrium in the eastern Aegean. His meddling led to the "Social War" against Athens in 357, and the consequent emancipation from it of several former allies, including Rhodes. Nonetheless, Rhodes remained under the domination of Caria until the arrival of Alexander the Great in 332. The island submitted to the conqueror, and its "liberation" from Persian influence consisted in the installation of a Macedonian garrison whose removal after Alexander's death was a cause for celebration.

Alexander's conquests and the activity of his successors created the conditions in which Rhodes was to thrive. The foundation of Greek cities in the new Hellenistic empires transferred the centre of trade to the east. The new trade routes

converged on Rhodes, and it rapidly became the chief commercial entrepot of the Levant, with consequent enormous economic prosperity. Furthermore, Rhodes managed to maintain its system of democratic government and independence even in the face of the warring Successors.

When the Successors Ptolemy of Egypt and Antigonus Monophthalmus were engaged in a power struggle in the eastern Aegean, Rhodes refused to join Antigonus against Ptolemy, thereby preserving its alliance with Egypt (Antigonus was interested in Rhodes because of its naval capacity – a considerable navy, impressive harbour installations, and shipbuilding timber). This was the occasion which led in 305/4 BC to the famous year-long siege of Rhodes by Antigonus' son Demetrius (who was to receive his nickname "Besieger" (in Greek, "Poliorcetes") as a result of this action; the siege is vividly described in Diodorus Siculus, 20. 82–88, 91–100). Demetrius did not take Rhodes despite ferocious assaults by land and sea, and in thanks for their salvation the Rhodians erected a 33-m-high bronze statue of their patron god Helios which was paid for from the sale of Demetrius' abandoned siege equipment. The Colossus of Rhodes was one of the most famous statues of all antiquity and was reckoned as one of the seven wonders of the ancient world. It stood until toppled by an earthquake in the early 220s BC.

In the first half of the 3rd century the friendship between Rhodes and Egypt was the mainstay of Rhodian policy and responsible for its rise to pre-eminence in both the political and commercial spheres. Under the benevolent eye of Egypt, Rhodes began to play an active role in the Aegean, beginning its crusade against the marauding pirates who threatened economic stability. Rhodes kept the pirates contained through special naval techniques, and this activity enhanced its prestige and the confidence felt towards it by seafaring communities.

Some time around the middle of the 3rd century, Rhodes appears to have distanced itself politically from an Egypt which had suffered loss of face on land (in the Chremonidean War) and sea (at the battles of Cos and Andros) at the hands of the Antigonids. For the rest of the 3rd century Rhodes stands on its own feet as the paramount Aegean power, stepping into the position of naval supremacy vacated by Egypt. At the same time these political differences do not seem to have led to a rupture of commercial relations between Rhodes and Egypt, since these ties were economically essential to both. Rhodes continued to win for itself the recognized position as protector of the island communities, and this was achieved when it refounded the "Nesiotic League" ("League of the Islanders") by the end of the 3rd century. The earthquake of the early 220s which toppled the Colossus (see above) also destroyed much of the ancient city. Significantly, all of the Greek kings of the east and west contributed lavishly to the cost of reconstruction, and even assisted in money and kind for the rebuilding of the Rhodian fleet – a sure sign of the high prestige and pacific intentions of the independent democracy at the time.

At this period Rome began to interfere in Greek affairs, and Rhodes was an active Roman ally in the wars against the Macedonian Philip V and the Seleucid Antiochus III. As a result, the Treaty of Apamea in 188 BC rewarded Rhodes with the possession of Caria and Lycia. Internal dissension between the pro- and anti-Roman factions within Rhodes led to political equivocation, for which Rhodes paid the price in the aftermath of the Third Macedonian War when it was deprived of Caria and Lycia. It was further punished in 167 BC by Rome's declaration of Delos as a free port, which gave Rhodes overwhelming competition as the centre of transit trade in the Aegean. Rhodes finally became an ally of Rome in 164 BC, thereby ending its political independence. From then on it shared the consequences of Roman intervention in the east, notably the Mithradatic War of 88 BC, and the Roman civil wars of the second half of the 1st century BC.

Ancient Rhodians famous for their cultural achievements include the 2nd-century BC Stoic philosopher Panaetius and his pupil Posidonius (a Syrian granted Rhodian citizenship); the sculptor of the Colossus of Rhodes, Chares of Lindus, a pupil of the great Greek sculptor Lysippus of Sicyon; and the 3rd-century BC epic poet and author of the *Argonautica*, Apollonius Rhodius (who may have been a native of Alexandria who settled in Rhodes).

Christianity came to Rhodes early. The apostle Paul records that he stopped in Rhodes on his way to Jerusalem (Acts 21: 1), local tradition maintaining that he came to a small harbour at Lindus. The importance of the early Church is attested by the fact that it had a bishop from early times, and the title of metropolitan was bestowed upon Rhodian bishops in the 4th century AD. Rhodes became part of the eastern empire after the Roman empire was divided in AD 395, and was subsumed into the history of the Byzantine empire for the following centuries. The Greek governor of Rhodes declared the island's independence during the troubled times of the Fourth Crusade, but in the early 14th century it was taken by force and occupied for the following two centuries by the Hospitaller Knights of St John of Jerusalem, having fled Cyprus en route from the Holy Land. The Knights constructed in western European style the medieval city which is a remarkable example of the military and domestic architecture of the period, and is the chief glory of Rhodes town today. Evidence of their relations with the local Greek population is still being researched, but the continuation of Orthodox traditions is clear from the evidence of Rhodian religious icons and frescos of the 13th–16th centuries AD.

The Knights of St John were expelled from Rhodes in 1523 after a formidable siege mounted by the Ottoman sultan Suleiman I ("the Magnificent") and eventually established themselves in Malta. Rhodes was garrisoned and became part of the Ottoman empire for the next four centuries. The conversion of several churches in Rhodes town into mosques during this period has given the surviving city a curious blend of western and eastern medieval architecture.

In the political turmoil leading up to the collapse of the Ottoman empire and World War I, Italy (then at war with Turkey) invaded and captured Rhodes and the other Dodecanese islands in 1912. The islands became part of Italy's Aegean empire, and Rhodes town in particular retains some extraordinary public buildings erected in a distinctive style during the next decades. The Italians were in turn expelled by the German forces during the later stages of World War II. Rhodes was then occupied yet again but was liberated by British and Greek forces in a daring commando raid in 1945. Rhodes was finally united with the state of Greece in 1947. Over the past 50 years Rhodes has become a thoroughly

modern Greek island, and Rhodes town a sophisticated cosmopolitan city. The 2400th anniversary of the foundation of Rhodes town was commemorated with great fanfare in 1992–93. The success of Rhodes as a major tourist resort has ensured that knowledge of the island – ancient, medieval, and modern – has spread throughout the westernized world.

Summary

Largest of the Dodecanese islands, Rhodes has been settled since the neolithic period and has traces of Minoan and Mycenaean presence. Three city states were founded (Ialysus, Camirus, and Lindus) which together established a federal capital, also called Rhodes, in 408/07 BC. It prospered as a trading centre and retained its independence and democratic government until 164 BC. From the 14th to the 16th century Rhodes was occupied by the Knights of St John of Jerusalem.

Ritsos, Yiannis 1909–1990

Poet

Ritsos was one of the most eloquent and prolific modern Greek poets. Displaying an extraordinary ability to combine the realistic, lyric, dramatic, and epic elements in his poetry and drawing on a surprisingly wide gamut of ideas, he has been recognized not simply as the poet of sensation but, most importantly, as the bard of the spontaneous and impulsive response to any kind of intuition. Being endowed with a genuine and effortless sense of compassion, possessing pure poetical gifts, and exercising the most remarkable skills, he was considered to be the initiator of cinematographic picturization and the personification of reality in modern Greek poetry. With his sharp and alert political spirit, Ritsos was capable of both conveying his own political experiences and reflecting the contemporaneous Greek political situation in his verse. His poems are filled with personal visions, individual denunciations and apologies, and enduring messages. Ritsos's poetry enabled him to express his doubts and hesitations, to voice his biting criticism, to phrase his disillusionment, and, finally, to convey his deeper concern for man and society. Thus, he is rightly numbered among the prominent representatives of Greek surrealist poetry able to express the subconscious mind, the irrational juxtaposition of things, and the illogical dimension of everyday reality.

The poetic legacy of Ritsos is huge in quantity and outstanding in quality. He began to write poetry from a very young age, and poetry soon became his dominant interest. Ritsos's formal debut in the literary milieu of his time took place in 1934 when his first collection was published under the title *Tractor*. His published *oeuvre* amounts to seven volumes (*Poems* in four volumes, *Fourth Dimension*, *Chronicles*, *Being*), while a significant number of his poems remain uncollected and some unpublished.

Ritsos treated the art of poetry as a means to approach the social and personal problems of his time and to propose possible solutions. He led a tumultuous and active political life stigmatized by personal deprivations, serious health problems, exile, and imprisonment due to his espousal of socialist ideas. Meanwhile a number of historically important events exerted a profound influence on the poet's work: the Balkan Wars, World War I, the Russian Revolution and the rise of socialism, the Asia Minor disaster of 1922. Not surprisingly, all those political transformations together with his involvement in the Greek Communist Party and his participation in the National Liberation Front (EAM) inspired his poetry.

Ritsos's principal contribution to the Hellenic literary tradition is twofold: on the one hand, through the thematic framework of his poetry; and on the other hand, through the art of poetry itself which he treated as the means to pronounce on the national accord, harmony, fellowship, and consensus among his compatriots. It is on that point that Ritsos's message acquired a universal quality emphasizing the principles of love, freedom, concord, and peace throughout the world. One of the recurrent themes of his poetry is the idea of his homeland, Greece. Ritsos's Greece is perceived as both the country and the people who are always striving to overcome the barriers, to heal their wounds, to surpass their difficulties in order to validate their enduring tradition. It is the same theme that had dominated the wider spectrum of Greek poetry, starting from ancient Greek epic and lyric poetry, transmitted to the Byzantine literary tradition, culminating in the literary production of the years after the Greek War of Independence, and transplanted to modern Greek poetry. Ritsos's Greece can be seen in its entirety, as the diachronic Greece, the living Hellenic heritage thriving throughout its long history.

Another main theme, closely related to that of Greece, is the worship of one's homeland. Nevertheless, Ritsos's passion for his native land is accompanied by a commensurate feeling of sorrow, agony, and pain. He insisted on a Greek landscape

drawn with the simplest, palest colours while at the same time depicting it as wild, barren, and infertile, permeated with perpetual light and inexhaustible sounds. In many respects, it resembled Homer's plain, bright, fierce panorama.

Of equal importance in Ritsos's perspective is the idea of the vigilant soldier, enhanced by his deep admiration for all those who never betray their principles, withdraw from the battlefield, or yield before the enemy. The poet seems to identify himself with the persona of the fighting man, when referring either to his ideological comrades or to the protagonists in any sort of struggle that validates life. In this respect Ritsos's contribution to the Hellenic tradition is indisputable. He recognizes the essential role of tradition in fusing the present, past, and future into an organic whole and in ensuring its continuity. Tradition operates as a powerful spiritual force that encourages man to look ahead to the future, and to make his return to the simple, archetypal way of life. Following the example of Socrates, he posed crucial philosophical questions and rhetorical dilemmas without offering any real answers to them.

Ritsos's meditative style and analytical interpretation are ratified in the theme of falsehood. He tends to disapprove of and express his aversion to any sort of hypocrisy. In fact, he attempts to emphasize the difference between the reality and the appearance of falsehood by standing between them. The philosophical treatment of this theme made a tremendous impact on the thought of other modern Greek poets and appealed to the general public.

As for his technique, Ritsos's verse is marked by vivid original imagery. His powerful pictures recall Homer's descriptive picturization of landscape, nature, and people. By making extensive use of a personified depiction of reality, he utters his personal cry. In this way, the inanimate reality automatically receives a real substance, undergoes psychological crisis, reacts, feels, suffers, and performs. Ritsos's cinematographic pictures come to replace words. His supreme ideas are heard distinctly from the mouth of an inanimate cosmos. His favourite imagery has to do with an extremely diverse landscape: on the one hand, it carries within it the elements of Andreas Kalvos's mute landscape; one the other hand, it is diffused by a blissful light which monopolized Odysseus Elytis' poetry.

Ritsos was capable of interweaving the world of dreams and fantasies with the world of factual reality. In this way, he presented his readers with a multidimensional reality. To understand such a reality, the reader has to set in motion his imagination and his insight.

Ritsos's persistence on a meditative, interior monologue in blank verse, the continual use of the collective first person plural, his apparent tendency towards introspection, his enlarged vision and philosophical manner led him to compose a kind of poetry which commanded a wide appeal and which could be addressed to all generations. Inspired by the most elementary objects of reality, he revealed an astonishingly mature vision of life and art. His first appearance in the literary world was greeted enthusiastically by Kostis Palamas, and his incorporation in the body of the Hellenic tradition was immediate. In 1956 he was awarded the Lenin Prize for literature, and he received numerous other international awards. His work has been translated into many languages. His contribution to the Hellenic tradition is of twofold importance. First, he succeeded in revitalizing the art of poetry by renewing its basic elements and by proposing a reality fused with traditional and new structures. Secondly, he made an enormous contribution to the revival of Hellenic poetry as a whole by introducing and exploring a number of striking poetic expressions and philosophical ideas. His influence on other Greek poets is considerable and will continue to be so. Passages from his poetry, particularly his distinctive long poem *Romiosini*, have been set to music by the composer Mikis Theodorakis in an attempt to marry modern Greek verse with folk music.

Biography

Born at Monemvasia in 1909, Ritsos moved to Athens in 1925. His health was poor and he suffered from tuberculosis. Moved by the political events of his time, he became a communist and was exiled during the Civil War. He was prolific as a poet – his published work runs to more than 5000 pages of poetry. He was awarded the Lenin Prize for literature in 1956. He died in Athens in 1990.

Roidis, Emmanouil 1836–1904

Critic, novelist, short-story writer, and translator

Emmanouil Roidis is remembered today chiefly for his satirical novel *I Papissa Ioanna* (Pope Joan, 1866), which provoked an

outcry in the Athenian press on its publication and was vigorously condemned by the Orthodox Church in a synodical encyclical. Subtitled "A Medieval Study", Roidis's novel is characterized in the book's lengthy preface as "a narrative encyclopedia of the Middle Ages". The narrator self-consciously evokes the apparatus of academic scholarship, including extensive footnotes, in order to present his fiction as an erudite study grounded in irrefutable historical fact. The narrative that follows, however, is a ribald adventure that draws upon an obscure medieval legend which claimed that the 9th-century Pope John VIII was, in fact, a woman.

The novel begins with Joan's "miraculous" birth, following her father's castration and her mother's rape by two soldiers, and proceeds to describe her relationship with the young monk Frumentius, her arrival in Rome, and her subsequent journey to Constantinople. On her return to the papal city Joan is elected as pontiff and conducts an illicit affair with the Chamberlain. It is only with her death in childbirth that the plague which is ravaging Rome is finally assuaged.

On the one hand, Roidis's novel engages ironically with the conventions of the historical novel which had become popular in Greece, partly through the translations of Sir Walter Scott's fiction into Greek from the 1840s. The riotous, indecorous ecclesiastical world Roidis evokes is far from being an idealized milieu of chivalrous deeds and romance. Significantly, it was during this period in the 1860s that Byzantium was being rediscovered by Spyridon Zambelios (1815–81) and the historian Konstantinos Paparrigopoulos (1815–91) as a vital link that established the historical continuity of modern Greece with the ancient world. On the other hand, the novel questions the assumptions that underlie realism by presenting outrageously fictional material as if it were documentary evidence and by consistently drawing the reader's attention to the rhetorical strategies which are mobilized in fiction to produce the illusion of verisimilitude. Recent scholarship has tended to emphasize the experimental, self-reflexive, and ironic nature of Roidis's fiction which, it could be argued, prefigures the exploratory narrative techniques of writers such as Kostas Tachtsis (1927–88) in the late 20th century. It was doubtless this interrogative aspect of Roidis's novel that prompted the satirical dramatist and author of *Ubu Roi* Alfred Jarry (1873–1907) to translate the novel into French. Indeed, *Pope Joan* is the only 19th-century Greek novel to have entered the European canon. First translated into English in 1886, a version was also produced by Lawrence Durrell in 1960 (reissued in 1999).

The fame of *Pope Joan*, which the author later dismissed as a "youthful sin", has tended to eclipse Roidis's major contribution in other fields. As the poet and critic Kostis Palamas (1859–1943) observed in 1899, Roidis's fame was a result of his notoriety following the publication of the novel, rather than of any deep acquaintance with his work. Yet Roidis was arguably the most perceptive and wide-ranging critic of his generation, a translator of versatility who produced short stories towards the end of his life, as well as making an important intervention in the language debate. Although the first attempt to anthologize his work took place within his own lifetime, in 1885, it was not until after Roidis's death in 1904 that an attempt was made by his nephew A.M. Andriadis and D. Petrokokkinos to collect his writings together in seven volumes (1911–14). Yet, with a few exceptions, notably Kleonas Paraschos's laudatory biography (1942, 1950), Roidis's reputation continued to wane and critics, taking their lead from K.T. Dimaras's summary treatment of the writer in his *History of Modern Greek Literature* (1948), tended to view his work (which, with a few exceptions, was written in katharevousa, or purist Greek) as obscure, superficial, and uninspiring, even while they conceded his enlightened intervention in the language debate on the side of the demoticists. The reassessment of Roidis which began in the 1970s and 1980s, after a long period of neglect, has at last brought the variety and percipience of Roidis's writing to the attention of a wider reading public. A decisive step along the way of Roidis's rehabilitation was the publication in 1978 of Alkis Angelou's authoritative *Collected Works*.

Roidis was born into a well-to-do family in Ermoupolis on the island of Syros in 1836, one of the commercial hubs of the eastern Mediterranean with a lively cultural life. Although the family moved to Genoa in 1841, Roidis returned to his native island in 1849 where he attended school and was a classmate of the writer Dimitrios Vikelas (1835–1908). Subsequently he studied literature and philosophy in Berlin, before working in the family business of his mother, Cornelia Rodokanaki. He travelled extensively before returning to Athens in 1859 and the following year published a translation of Chateaubriand's *Itinéraire*, which was followed two years later by a study of the critic Sainte-Beuve. During his career Roidis translated work from such diverse authors as Edgar Allan Poe, Charles Baudelaire, and Thomas Macaulay, whose *History of England* appeared in Greek between 1898 and 1902. Roidis also contributed numerous articles and reviews to journals and newspapers such as *Estia*, *Parnassos*, *Asti*, *Ora*, and *Avyi*. In 1873 Roidis lost the bulk of his family fortune through bad investments; with the help of friends, however, he secured a position at the National Library in Athens where he worked from 1880.

The combative, sometimes vituperative style of Roidis's writing offended many of his contemporaries. The writer Georgios Drosinis (1859–1951), for example, recalled in his autobiography how Roidis was known as "the policeman of Art" who was apt to censure others without offering a positive alternative to the positions being criticized. No doubt Drosinis had in mind Roidis's criticism of contemporary Greek ethographic writing in the preface to Konstantinos Metaxas-Vosporitis's collection of short stories entitled *Skinai tis Erimou: Ithi Vedouïnou* (Scenes of the Desert: Customs of the Bedouin, 1899). Contemporary Greek writers, Roidis asserted, had become monotonous in their preoccupation with an idealized rural setting and the public had grown weary of fishermen and shepherds. It is undoubtedly true that, as in his famous exchange with Angelos Vlachos (1838–1920) in 1877, Roidis revelled in controversy. On the occasion of a drama competition organized by the *Parnassos* literary society, Roidis, who was on the competition's committee, published an article in which he maintained that poetry reflected the cultural and social concerns of the society in which it was produced. He concluded, devastatingly, that: "it is impossible for a poet to be born and to exist outside of any poetic atmosphere; we do not have such an atmosphere in Greece today, since, on the one hand we forsake our local traditions, and on the other, we still

play no part in the intellectual life of Western nations." Roidis's bold assertions were attacked by Vlachos, who vehemently rejected what he construed as Roidis's deterministic view of culture. Poetry, for Vlachos, was born of the imagination; the influences of the poet's surroundings hindered rather than nourished his creativity. This essentially Romantic conception of poetry was in turn condemned by Roidis who went on to develop his ideas in a sharp-witted article entitled "On Contemporary Criticism in Greece". Here he evoked Darwinian thinking and quoted Herbert Spencer as saying that great men must be classified as part of the society which produced them. For Roidis all cultural expressions were historically contingent and a complex reciprocal relationship existed between artistic creation and social and political environments. This comparative interest in a more broadly defined notion of culture is evident in the range of Roidis's articles that touch upon all aspects of Greek society from women's emancipation to food, urban living, and the treatment of animals. His journalistic sketches vividly evoke the texture of everyday life in late 19th-century Athens and, ironically, in so doing are reminiscent both of Vlachos's sketches as well as the tales of Michail Mitsakis (1863–1916).

With the principal exception of a fairy tale entitled "The Apple Tree" most of Roidis's texts are written in a purist Greek. Ironically, however, he was a supporter of Yannis Psycharis (1854–1920) and celebrated the poetry of demoticists such as Athanasios Christopoulos (1772–1847), Ioannis Vilaras (1771–1823), Dionysios Solomos (1798–1857), and Aristotelis Valaoritis (1824–79). In his study *Ta Eidola* (The Idols, published in 1893), Roidis supported the cause of the spoken language, although he expressed himself in an elegant katharevousa. The term *diglossia* (bilingualism) first seems to have been used by Roidis in his review of Psycharis's controversial book *To Taxidi mou* (My Journey, 1888).

Roman Catholic Church

In Greek lands the Roman Catholic Church was distinct from the Greek Orthodox Church in that its members, known as "Latins" (*Latinoi*), recognized the authority of the Roman Church in ecclesiastical matters and because they used Latin as their liturgical language. It is therefore in everyday events and in personal relationships that the Roman Church is important in the Levant. Generally, tolerance and mutual cooperation between lay members of the Roman and Orthodox faiths existed in the face of political and doctrinal disputes at the level of popes and patriarchs. The Great Schism of 1054 led to the mutual excommunication of pope Leo IX and patriarch Michael Keroularios, but both sides had been careful to limit their mutual censures, and the dispute seems to have affected individual Greek and Latin Christians little. There was no general excommunication of either the Greek or the Latin Church and indeed much cooperation is evident.

Amalfitan merchants had established a Benedictine monastery on Mount Athos in the 10th century. This, one of the oldest Athonite houses, was to maintain an independent existence down to 1393. In 1212 the patriarch of Alexandria had ordained a Latin deacon to the Latin priesthood in the absence of any Latin bishop, while his clergy had a tradition of giving spiritual succour to Latin prisoners in Alexandria. In the Crusader states set up in the 12th century, Latin patriarchs in Jerusalem, Antioch, and (later) Constantinople saw themselves as successors to their Greek predecessors, even if this perception was not shared by their Greek subjects. In their day-to-day dealings Greek and Latin Christians in the Levant paid little or no heed to papal pronouncements and patriarchal opinions. The pope or the patriarch might disapprove at an official level of such cooperation between members of the two communions, but they were after all coreligionists.

This general mood of cooperation and mutual toleration could be upset by specific political and military causes which might in turn be affected by demographic factors. Thus the Norman conquest of southern Italy and Sicily in the late 11th century not only brought an effective end to the Byzantine patriarchate in the region but was also marked by considerable pressure on Greek priests in the area to acknowledge the ecclesiastical primacy of Rome. In return, considerable flexibility over the Latin tonsure and rules of celibacy was allowed but Greek religionists were enjoined to conform to Latin practices. This, together with the encouragement of Latin immigration from northern Italy, resulted in the virtual extinction of Greek culture in Sicily by the beginning of the 13th century.

Before 1204 the presence of western merchants, pilgrims, mercenaries, and other Latins in the Byzantine empire necessitated the availability of Latin priests to minister to their spiri-

tual needs according to the Latin rite. However, Latin priests were few and the materials needed for their ministrations – such as a church building, candles, chrism, and bread – had in practice to be obtained locally and with the cooperation and assent of the Greek host community. In the cities of the Levant most concern at an official level was focused on the relations of the minority Latin Christians to the Byzantine patriarch. This usually took the form of attention to minor differences in practice such as the use of unleavened bread at the Eucharist, certain dietary issues, the observance of particular fast days, and the fingers used in signing with the cross. These were differences that would be evident in daily practice. Interestingly, Latin clerical celibacy and the tonsure received scant attention at patriarchal level. It is also notable that so much was said about *azymes* (unleavened bread) and virtually nothing about the *filioque* which was to be the major sticking point of Church union debates at papal/patriarchal level in the 13th century and later.

In practice there seem to have been few problems with the establishment of the Benedictine monastery on Mount Athos around 985. Similarly, all the trading outposts granted to the Almifitans, Genoese, Pisans, and Venetians were endowed with the grant of a church for their use. Latin burials were also respected by the host communities. Political disputes that culminated in the Great Schism might result in local difficulties. The patriarch Michael Keroularios closed Latin churches in Constantinople, but this ban was difficult to enforce and at the time of his death in 1058 all churches were open and functioning. There was concern in Rome that Latins resident in the Byzantine empire might conform too readily to Greek rites. Around 1200 Innocent III banned Latin priests from confirming children by chrismation in accordance with Orthodox practice and was uneasy about Latin communities obtaining chrism from the patriarch. On the eve of the Fourth Crusade there was no clear line distinguishing Roman Catholics from Greek Orthodox.

Even with the fall of Constantinople in 1204 and the subsequent establishment of Latin lordships in Greece and the Aegean there appears to have been no plan on the part of Innocent III to set up a separate Latin Church in the conquered territories. It was the Crusaders themselves who had elected a Latin patriarch. Although Innocent acquiesced, he was much more concerned with this election as a gross example of lay intervention in clerical appointments. He was also particularly concerned with the protection of the rights and lands of the Greek Church, for which the Crusaders had made no provision in their division and subsequent conquest of the Byzantine empire. Innocent III viewed the fall of Constantinople as a just judgement on the proud and schismatic Greeks, who would now see the error of their ways and acknowledge the ecclesiastical supremacy of Rome. Greek lands were to be preserved and Innocent's legate in Constantinople was to conduct seminars to persuade and instruct the Greek clergy in their error and in the way forward. In fact only a handful of Greek bishops became Latinized. Union did not follow conquest. Pressure was brought on the Greeks within the city by the closure of their churches, but was ineffectual. In the provinces where the Latins formed a very small minority of the population it was never even tried. Accommodation based on mutual toleration was reached with local notables. Despite occasional fulmination from Rome during the course of the Latin occupation, this situation held firm. It was only on the island of Cyprus that there were Greek martyrs to the division of the churches. Latin bishops were appointed in the former Greek diocese; the motivation for these appointments came from the new Latin lords themselves, concerned both for the spiritual needs of their Latin followers and for their own status. The presence of the bishops persisted only as long as Latin control held firm. In some areas like Thessaly and Thrace this was not very long at all. The extreme violence shown by Michael of Epirus to Latin priests who fell into his hands in 1210 is a sign that a new element of intolerance was appearing between the Roman Catholics and Orthodox Christians. This manifested itself in the writings of propagandists at the court of the Greeks in Nicaea, eager to condemn anything Latin and in particular Roman Catholic religious practices. After the loss of Constantinople by the Latins in 1261 attempts on the part of the papacy to lend support to the former Latin emperor exacerbated this polarization. The capture and sack of Constantinople would never be forgotten or forgiven. The Latins were no longer coreligionists to be tolerated but heretics who were now enemies of the Hellenes and targets to be attacked. Such attitudes can be detected in the village of Galaxdi in 1404, yet even there hostility did not result in violence but in legerdemain at the expense of certain Hospitaller knights.

The new Hellenism of the late 13th century defined itself in large part by its religion, and the differences between Roman and Orthodox Christianity became more clearly defined. This was certainly evident at an official level: the Orthodox Church of Cyprus was banned from communion with the Orthodox Church until the Turkish conquest in 1571 because it was deemed to have submitted to Rome during the years of Lusignan rule, while the Great Schism of 1054, which had gone largely unnoticed at the time, took on such significance that the rift was not to be healed until 1965.

The Ottoman conquest of Greece and the Aegean (Greece 1450–1500, Rhodes 1523, Chios 1566, Cyprus 1571, and Crete 1669) led to the reduction of Roman Catholic communities by emigration and deportation. It appears from the island of Chios that this particularly affected the availability of Latin priests. Nevertheless, pockets of Latin Christians persisted in Constantinople and other cities of the Ottoman empire and on the Aegean islands. The Catholic communities had powerful protectors in the west, particularly the kings of France, and to some extent this set them apart from the other religious groups, or *millets*, within the empire. Interestingly, at a local and personal level, there are many examples of cordial relations, mixed marriages, and common services. Again such behaviour might be disapproved of at an official level on both sides but it persisted. It was as an institution and as an idea that Roman Catholicism was unacceptable in Greek lands. At a personal and practical level Christians from both communions had always coexisted with and assisted each other as neighbours in Christ.

Roman Period 31 BC–AD 330

Long before Roman political control of Greece began in the 2nd century BC, contact between Greece and Rome had already wrought cultural and economic changes in both regions. Scholars have found evidence of a Greek presence in Italy from as early as the Mycenaean era and throughout the period of colonization in the 8th and 7th centuries BC. Within 50 years of colonizing southern Italy and Sicily (Magna Graecia), Greek communities began to engage in a flourishing trade and an exchange of ideas with the Italians. The Romans adopted some Greek gods, their temples took on aspects of Greek architectural styles, Greek artisans produced pottery for the Italian market, and Greek historians wrote about the origins of the Italians and Romans. Writers such as Timaeus made genuine efforts to understand the history of Italy, in light of the growing power and influence of Rome. While these writers tended to Hellenize Roman history and origins, their views were accepted by the Romans themselves.

Gradually there began a fusion of Greek and Roman cultures. The Romans entered into more formal relations with the local Greek city states, while the mainland Greeks became actively involved in conflicts in Magna Graecia. The merging of Roman and Greek politics and culture began in earnest with the military interference in Greek affairs by the Romans, in particular during the Achaean War (146 BC). After the Achaean War Corinth was levelled, vast amounts of booty were shipped to Rome, the men were massacred, and the rest of the inhabitants sold into slavery – leaving the once bustling town empty and in ruins. The events that followed this war are unclear, but over the course of the next century these events slowly reshaped the Hellenistic east into provinces of the expanding Roman empire, and Greek city states into Graeco-Roman municipalities.

This contact, while certainly important politically and economically, at first had only limited influence on the essence of Greek civilization. The Greeks themselves, and the Romans too, had a profound respect for the language, literature, and culture of the Hellenic world, which would remain unshaken by political conquest, devastation by Roman legions, and economic turmoil of the 1st century BC. Elite Romans continued to send their sons to Greece for the finishing touches on a proper education. Cicero and then his son went to Athens, as did Ovid and Horace – who saw that Greece had captured its captors ('Graecia capta ferum victorem cepit et artis intulit agresti Latio' [*Epistulae*, 2. 1. 156–57]). Colonies of veterans were founded, especially by Julius Caesar and Augustus, some nine or ten in Greece, and included the revival of cities such as Patras and Corinth. Yet these colonies were quickly assimilated to Greek culture, and the Greek language superseded Latin. Indeed, the administrative language in the east generally was Greek; edicts and legal proceedings were in Greek. The eastern legions were largely recruited from among the Greek-speaking peoples. Roman citizenship remained rare in the Greek east (until AD 212 when Caracalla proclaimed the *Constitutio Antoniniana*), and only a few citizens were created by their enrolment in these legions.

This is not to say that no Romanization occurred. Greek art, which the Romans greatly admired, was influenced by Roman patronage. The Romans showed their affection for things Greek both by carrying off treasures to Italy and by buying copies of the Classical and archaic works that were in vogue. But the Romans also controlled the economic life of Greece by providing a market and consumer demand thus dictated artistic output. Among the distinctive forms of Roman art was realistic portraiture, rather than the pure idealization found in Greek art. New subjects were explored by Greek artists as a result of Roman interest in recreating a strong sense of psychological reality. Stricter realism was appealingly combined with an attempt to convey character. Common themes investigated youth and age, hermaphrodites, groups suggesting a complex set of emotions (e.g. the *Laocoön*), or physiological studies (e.g. the *Belvedere Torso* and the *Boxer*).

During the principate, Roman building techniques were widely adopted in Greece (for example, in the use of fired brick and brick with mortar construction, as well as, occasionally, podium-style temples). Other Roman amenities, such as baths, became a common feature of any well-appointed Greek town, while mosaics, wall paintings, marble revetments, and Roman-style garden sculptures became an integral part of costly homes and public buildings. For reasons of both economy and an archaizing spirit, reuse of architectural materials was common throughout the Roman period (for example, 12 unfluted Ionic columns were brought from the temple of Athena at Sunium for use in Athens for a podium temple in the Agora).

Since Greece had lost its ability to compete through war, the centuries of Roman rule provoked a new competitive spirit. Abandoning the old political rivalries, cities were now transformed by cultural battles. Citizens strove to build ever more beautiful buildings, and, with Roman direction and encouragement, they offered expensive prizes to their victors in the Panhellenic games. During the 2nd and 3rd centuries AD Achaea held a privileged position in the world of these athletic competitions. Celebrating such contests in the Greek manner became a popular pastime throughout the Graeco-Roman east. The games were expanded and an elite circuit of festivals was established that included the four ancient Panhellenic festivals, as well as newer games such as the Asclepian games at Epidaurus, the Olympia Commodea at Sparta, and at Athens the Panhellenia, the Olympia, and the Hadriana. Other popular games, off the most common circuit, were found at Sparta (the Urania) and in Boeotia (the Eleutheria at Plataea, Trophonea at Lebadea, and Heraclea at Thebes). Regional games also existed and, though these were locally popular, they tended to have fewer out-of-town visitors and very small prizes

(such games included the Gorgas festival at Ambryssus and the Euryclea at Sparta). Nearly every city had its own gymnasium where the young men could train for the games.

Likewise drama, music, and even religion provided an arena for competition, not only through the building of temples and theatres, but also through the professionalization of actors, singers, and poets, who toured throughout their regions. Religious festivals generally became elaborate affairs, particularly with the introduction of popular new cults into the Graeco-Roman world. The mystery cults of Isis, Mithra, Judaism, Christianity, and the imperial cult of Roma and Augustus were among the most common of these. The imperial cult was, of course, also a means to express loyalty and support for the rulers of Rome. This cult was introduced very early in Greece; for example in Athens the cult was founded in 27 BC. In fact, religious fervour seems to have been on the rise throughout the Graeco-Roman world and can be seen even in philosophical movements such as Neopythagoreanism and Neoplatonism, both of which evoked strongly emotional and spiritual reactions. Cities also demonstrated their importance through their support of education: higher education was paid for out of public funds and even smaller cities had teachers on salary.

Many Roman emperors showed an active interest in Greece (sometimes, of course, this meant despoiling Greece of its art and antiquities). Pausanias reports that Claudius restored to Greek cities the artworks and statues that his predecessor Caligula had looted. He also remodelled the entrance way to the Athenian Acropolis. Nero was a devoted and active Philhellene. He spoke Greek, attempted to cut a channel through the isthmus of Corinth (to improve communications and trade), and he declared Achaea free at the Isthmian Games in AD 66/67, though this status was overturned by Vespasian only a few years later.

While the emperors clearly felt it their right to remove whatever objects from Greece they wished, imperial dedications to Greece could be substantial, including buildings, roads, and other physical manifestations of their concern for Achaea (as well as concern for their own prestige). The Flavian and Trajanic ages particularly marked an increase in both local and imperial benefices to Greek cities. Trajan built the Library of Pantaenus in Athens and instituted a competition in Sparta for the "best citizen". Sparta's competition relied on a citizen's "love of honour" and the prize was the right to take over the city's costly liturgical offices in a generous way.

Some Roman benefits had a profound effect on the appearance of Greek cities. Among the most dramatic of these was introduction of the colonnaded street – broad avenues flanked by matching porticoes and often paved in marble (such as at Athens and Corinth). Hadrian supported numerous costly projects including buildings at Delphi and many structures in Athens – transforming and restoring Athens in the process (Hadrian's Library in Athens was closely modelled on the temple of Peace in Rome and helped to create a new sense of space in the centre of one of Greece's oldest cities). The emperor also had constructed stoas, temples, aqueducts, bridges, and baths throughout the province of Achaea. Private benefactors participated in such largesse as well. One of the most famous of these was the wealthy Athenian, Herodes Atticus. A Sophist, Roman senator, and a friend of Hadrian's, he used his wealth and power to beautify Greece (for instance, he built a music hall and stadium in Athens, replaced statues at Olympia, and remodelled a music hall in Corinth).

In 131/32 Hadrian founded the "Panhellenion", an organization of Greek cities (from Greece, Asia Minor, and north Africa) centred in Athens. By creating this organization he implicitly joined himself to the traditions of Classical Greece and the legends of Athens' founder, Theseus. Hadrian's behaviour was set neatly within a cultural context that generally idealized and tried to revive the Greek past. A specific feature of this 2nd-century Greek revival was known as the Second Sophistic, a movement in which Sophists, or teachers of rhetoric, sought a public reputation. References to the past were central to their approach and were integral in their performances. Most Roman elites, even many of the emperors, had been schooled by such rhetoricians. Thus, rhetorical and philosophical schools flourished in many Greek cities, including Athens and Sparta. (Marcus Aurelius eventually endowed philosophy chairs in the cities of Achaea, in part because of the respect instilled by his own training.) This education and the fairly common activity of tourist travel to Greece – a fashion encouraged by Hadrian's own travels in Greece – combined with the foundation of the Panhellenion, created a climate favourable to merging both the "Greek past and the Roman present". This lively and pro-Greek atmosphere, though archaizing, benefited Greece both materially and intellectually. Roman respect for Greece and its traditions lasted well into the 3rd century AD.

At the same time, Greek elites were beginning to infiltrate the Roman aristocracy, by being admitted increasingly to the senate and equestrian classes. Local elites continued to play important roles as Roman administrators and representatives. These men formed a part of the empire's governing body. This is not to say, however, that the Greeks accepted Roman authority without resistance. Revolts erupted periodically throughout the period of Roman rule into the 2nd century AD. Indeed, a small abortive rebellion occurred even under the relatively benevolent rule of Antoninus Pius. Less overt forms of resistance were also present in Greek behaviour through, for example, continued local control of religious icons, rituals, and sacred space.

The late 2nd and 3rd centuries AD brought unwelcome changes to the entire Roman world. Civil wars, economic woes, migrations, and invasions from the north characterize this era in Graeco-Roman history. The needs of the imperial treasury increased economic and material demands on the provinces. Ambitious building projects and artworks were neglected in favour of defensive structures and strategies, especially since the northern peoples were no longer held back at the borders of the empire, forcing the Greeks to defend themselves from invaders such as the Goths in AD 262 and the Heruli in AD 268 (these latter were expelled by the Philhellene emperor Gallienus). According to tradition, the Herulians destroyed nearly every building in Athens (except perhaps the area around the southern slope of the Acropolis). These attacks did leave tangible remains, both in the numerous destruction layers of Greek towns, and in the visible response of the inhabitants of Greece. The citizens of the unarmed province of Achaea, Zosimus recalls (1. 29. 3), fell into a panic at first, but evidence also suggests that inhabitants fought the invaders off

and then, in some regions, hurried to restore and/or build fortifications both in urban areas and on the frontiers. An inscribed poem in Athens records this building effort after the Herulian attack: "As Amphion raised the walls of Thebes by the music of his cithaera so now do I, Illyrius, follower of the sweet voiced muse build the walls of my native city." Claudius Illyrius was the governor of Cyprus and was honoured with statues on the Acropolis of Athens, perhaps for the gift of walls to his native city.

Upon Diocletian's accession to the throne, the empire was temporarily at peace and the emperor set about solving the more serious economic and social problems in the provinces. Some regions in Greece enjoyed a brief building boom, but when he stepped down, conflict began again, and the Balkans, Greece included, became a recruiting ground for Constantine's civil war with Licinius. Constantine, once in power, moved his capital to Byzantium,"New Rome" or Constantinople. In deference to Greece's illustrious past, Constantine encouraged another revival of Greek letters and renewed support for educational institutions after the hiatus of the civil wars. Thus, during the early 4th century Achaea generally saw a renewal of building and literary activity, rejuvenation in the decorative arts (Christian sarcophagi were the medium of some of the best sculptural artists of the times), and an invigorated economy. Nevertheless, in the tradition of earlier emperors, Constantine felt it his right to remove art and artefacts from his provinces, including Achaea, to beautify his new capital. Despite the emperor's respect for Greek traditions, and his desire for its art, there was a widespread decline in the dominance of Hellenic culture among the Latin ruling classes. The court at Constantinople, for example, was predominately Latin-speaking, forcing ambitious Greeks to learn Latin and Roman law in order to get ahead. Increasingly too, after the 4th century, Greeks became Christianized. Hellenic political, religious, and economic orientation turned east and thus began the transition in earnest to the later Roman empire, or early Byzantine era, in Greek history.

Summary

Dated 31 BC to AD 330, the Roman period follows the Hellenistic and precedes the early Byzantine. The annexation of Egypt in 31 BC completed the Roman conquest of the Hellenistic world. Greek culture was widely admired and imitated by the Romans. Many Greek works of art were removed to Italy but Greece was also the recipient of much imperial munificence. Roman and Greek cultures merged, revealing the power of Greek traditions.

Romance, Byzantine

The reign of Manuel I Komnenos (1143–80) saw the revival of both satire and romance, the latter dormant since the 4th century AD. A tiny quantity of fiction had been written in the intervening years, most notably the romantic epic *Digenis Akritas*, recensions of such things as Aesop's fables and the *Alexander Romance*, and innovative adaptations from the Arabic of, in the 8th or 9th century, the immensely popular *Barlaam and Ioasaph* (originally a Buddhist fable in Sanskrit) and, in the late 11th century, *Stephanites and Ichnelates* (mainly animal fables, again originally in Sanskrit), while around 1100 a series of largely sexual tales in a narrative framework (of probably Persian origin) had been reworked from the Syriac as the *Book of the Philosopher Syntipas*.

Pure fiction had, however, been largely supplanted as entertaining literature by the saints' Lives, which were also uplifting. These, like the romances, often entail exciting adventures and end in the much-desired union of the hero with the beloved. It is perhaps more than merely coincidental that the revival of the romance followed close upon the decline of hagiography. The collapse of military, territorial, and economic strength, and the growing concomitant doubt that the Byzantines were the favoured recipients of divine providence, probably also encouraged a genre whose theme was largely the subordination of man to the cosmic forces of Love and Chance. The ancient novels were still known (the five surviving examples today are the result of Byzantine choice), their popularity being in part due to the metaphorical interpretation of their plots as struggles for salvation. Most often read seem to have been those of Achilles Tatius and Heliodorus, the subject of reviews by Photios and of a comparison by Michael Psellos. This ancient inheritance became the inspiration for the 12th-century "learned" romances, which are nonetheless no slavish imitations. All four are written in the high language, with only very few and minor intrusions of the vernacular, and are clearly intended for an educated readership that must have been familiar with the prototypes in order to appreciate their literary allusions. All four are again traditional in that they retain an antiquarian and pagan setting, but three break new ground by being in verse.

The earliest is almost certainly *Rhodanthe and Dosikles*, which was written in the 12-syllable accentual metre by the court poet Theodore Prodromos, perhaps in the 1140s. Though imitating Heliodorus' *Aethiopica*, it is more skilfully constructed, more rhetorically sophisticated, and more intellectual and, while keeping the excitement of piratical and other adventures, it probably reflects through them contemporary military and diplomatic preoccupations.

Clearly modelled on this romance, and written in the same metre, is *Drosilla and Charikles*; the author, Niketas Eugeneianos, wrote an epitaph on Prodromos and was either a younger friend or his disciple. Like his predecessor, Niketas does not completely avoid his own world, and his *ekphrasis* (description) of Drosilla coincides verbatim with that of the ideal bride in his own *epithalamium* on the wedding of the court official Stephen Komnenos. Nevertheless, Niketas's tone is more pastoral, with an obvious debt to Longus' *Daphnis and Chloe*, and on occasion he introduces a note of pure comedy as in his description of Maryllis's drunken dancing upon the table or the literary pretensions of the bumpkin Kallidemos.

Constantine Manasses is best known as the author of a popularizing verse chronicle, and his romance *Aristandros and Kallithea* survives unfortunately only in fragments. Despite an interest, new to the romance, in fabulous beasts, it is most noteworthy for its choice of the 15-syllable metre known as "political", which became standard for vernacular poetry until the late 17th century.

The last romance written in the high language, and also the only Byzantine example to revert to the ancient precedent of prose, is Eustathios (or Eumathios) Makrembolites's *Hysmine and Hysminias*. This is modelled on Achilles Tatius' *Leucippe and Clitophon* and, especially, the romances of Prodromos and Eugeneianos. More interestingly, Makrembolites appears to draw also on the novel *progymnasmata* (preparatory exercises) of his contemporary Nikephoros Basilakes, especially in abandoning the traditional narrative style for the character study. His romance is highly charged with eroticism, although in conformity with the still-unbroken rule of romances the heroine miraculously preserves her chastity to the end. This eroticism is largely realized in the early books by allegorical paintings and Hysminias's own dreams. No other surviving romance is as psychologically subtle, and no other makes such demands on the reader to appreciate the often humorous parody created by quotation and covert allusion to a wide range of ancient literature. It is innovative also in using a first-person narration.

With the sack of Constantinople in 1204 the era of the "learned" romances in the high language came to an end. The 11 surviving romances of the 14th to 16th centuries are all written in some form of the vernacular, but with a widely differing lexical and grammatical admixture of the high language. Since, however, most of their manuscripts date from *c.*1500 or later and exhibit considerable divergences in language, it is a matter of much scholarly debate as to what was their exact original form and consequently readership. That, for some of these works, this must have included the intellectual elite is shown not only by literary subtleties but also by the fact that the single one that is not anonymous, admittedly the least "vernacular", was actually written by a member of the imperial family and received a religious exegesis from the court poet Manuel Philes. One feature common to most of these compositions is an exuberant enthusiasm for the coining of multiple compound words, especially adjectives. They all exhibit also a varying and at times dominating degree of influence from western romances. Five are original Greek works, six are adaptations or translations. Whereas the verse romances of Prodromos and Eugeneianos numbered just over 4600 and 3600 lines respectively, the "vernacular" romances tend to be considerably shorter.

The earliest original work, possibly dating to the very early 1300s, may be the *Tale of Achilles*, which has been preserved in three separate versions. It is best described as a romance of chivalry that is indebted not only to *Digenis Akritas* but also to more conventional romances. It reveals the contemporary Graeco-Frankish world of tournaments, jousting, and a knightly abduction, and retains from Homer no more than the names of Achilles, Patroclus, and the Myrmidons. Unlike other romances, which conclude happily with the union of the lovers, the *Tale of Achilles*, like *Digenis Akritas*, ends in a death, this time of the heroine who is mourned inconsolably by her husband.

Kallimachos and Chrysorrhoe (2607 lines) was written by Andronikos Palaiologos, a nephew of the first Palaiologan emperor, Michael VIII (1259–82). Although it shows considerable acquaintance with earlier romances, both ancient and Byzantine, it contains many folkloric elements. The hero is the youngest of three princely brothers who set out to prove themselves worthy of succeeding their father. He penetrates a castle perched on a mountain, rescues a damsel from an ogre, loses her to an abduction by a neighbouring king, feigns death through a witch's magic apple, and works in disguise as a gardener in the king's palace grounds. The ending is unexpected: when the two are caught together Chrysorrhoe wins their freedom with a well-composed speech.

In the much shorter *Belthandros and Chrysantza* (1348 lines), most probably from the 14th century, the hero follows a magical river of fire and water to the castle of Eros the king, where he reads a prophecy that he will fall in love with the heroine. Unfortunately, just after he has adjudicated her the winner of a beauty competition which is reminiscent of a bride show, she vanishes. However, a few exciting adventures later, they are permanently united. Like *Kallimachos and Chrysorrhoe* this romance moves from the world of fantasy to that of a fictional reality.

The five surviving manuscripts of *Libistros and Rhodamne* differ so greatly in length, language, and even sequence of episodes that it is impossible to reconstruct exactly what the 14th-century original was like. The probably most reliable manuscript gives a length of 4407 lines. Alone of the vernacular romances it interweaves two love stories, one of the eponymous couple, which ends with their union, and the other of the narrator Klitobos, the result of whose courting of Myrtane, a widow and his former mistress, is left uncertain. Realistic elements again appear in combination with the fantastic, which latter take the form of a magic ring, flying horses, and erotically prophetic dreams.

Because of its familiarity with other literature and its use of Italian loanwords the *Tale of Troy* (1166 lines) may perhaps be dated as late as the fall of Constantinople or even later. It begins as a romantic tale of Paris. To prevent the destruction of Troy should he reach manhood, he is put to sea in a basket, but, having been rescued, shut up in a tower, and shipwrecked, he eventually gains access to Helen in the disguise of a monk and takes her back to Troy. Thereafter Paris recedes into the background as the emphasis shifts to Achilles, the lamentation over whose death at the hand of Paris concludes this poorly constructed story.

A further work of fiction, though not strictly a romance, depends upon the romantic tradition. In the late 14th century Theodore Meliteniotes, possibly the same as a writer on theology and astrology, composed in 3062 lines an astonishing allegorical poem in the high language entitled *To Chastity*, in which may be found allusions not only to Greek authors but even to Pliny the Elder, Boccaccio, and Dante. In its attack on entertaining literature it mercilessly parodies Byzantine and western romances. The late 14th-century verse *Romance of Belisarius* is a largely legendary history of Justinian's general rather than a true romance. Emphasizing the workings of envy and revealing tension between classes, a feature rarely found in Byzantine literature, it proved sufficiently popular to gain two rhymed redactions during the Tourkokratia.

Of the Greek adaptations and translations the closest to their originals are the 14th- or 15th-century *Phlorios and Platzia-Phlora* and the probably late 15th-century *Theseid*. The former is a translation of *Il Cantare di Fiorio e Biancifiore*, the Tuscan version of a widespread western medieval tale of ultimately eastern origin. The latter is a translation of Boccaccio's *Teseida*. The monstrously long *War of Troy* of perhaps *c.*1350 is at 14,369 lines still slightly less than half the length of its immediate source, Benoît de Saint-Maure's *Roman de Troie*. The tale thus goes full circle since the French version derives from the pseudo-autoptic Latin accounts attributed to Dictys Cretensis and Dares Phrygius, the former of which for certain and the latter probably were translated from Greek in the 4th and 5th or 6th centuries respectively. The Byzantine version oddly omits exotic details, but, indicative of the less warlike nature of the Greeks, it also omits the prolix battle scenes. The omission of the judgement of Paris probably reflects its suppression in Manasses' influential chronicle. The short *Imberios and Margarona* is a translation from either French or Catalan which probably predates the oldest surviving French version from 1453 of *Pierre de Provence et la Belle Maguelonne*. *The Old Knight* is the modern title for an incomplete 14th-century poem of only 307 lines very freely taken, perhaps through an Italian intermediary but with added Homeric allusions, from the Arthurian prose romance *Guiron le Courtois*. Its theme is Branor le Brun's challenge to the younger knights of the Round Table. Uniquely in the post-12th-century romances it is written in the high language. The 14th- or 15th-century *Apollonios of Tyre* is an adaption of a 14th-century Tuscan translation of a Latin tale, itself possibly dependent upon a Greek original of the time of the early romances. Its main interest is in the Christianization of the pagan setting of its model. It also is thus unique among Byzantine romances. The verse redaction of Callisthenes' *Alexander Romance* is, like the *Romance of Belisarios*, fabulous history rather than romance. It, *Imberios*, and *Apollonios* also share the fate of later reworkings into rhyming verse.

The greatest Greek literary production of the Tourkokratia is the *Erotokritos*, written in Crete around 1600 by Vitsentzos Kornaros, a poet of noble Venetian descent. Despite its debt to Pierre de la Cypède's *Paris et Vienne*, it is an original work in its own right. Set in ancient Athens, it unfolds in just over 10,000 lines the ultimately successful love affair of king Heracles' daughter Aretousa and Erotokritos, the son of a royal counsellor. Possibly aware only of the *Theseid* and *Imberios* among Byzantine romances, Kornaros nonetheless suffuses a romance of western chivalry, replete with long speeches and psychological exploration, with the hues of a poetic and chronologically composite Greek world.

Traditionally castigated by scholars, when not completely ignored, for being paltry imitations of ancient exemplars of a second-rate genre, Byzantine romances are now enjoying a sensitive re-evaluation. Their *ekphraseis* are no longer regarded as wearisome rhetorical irrelevancies but as integral parts of a whole, their literary borrowings are being appreciated as frequently subtle or even humorous parody, and, in the best of them, artistic construction and psychological characterization are being carefully revealed. They can now claim a small, but not contemptible, place in the history of world literature.

Romania

Romania is situated on the western shore of the Black Sea at a point where routes from Central Europe to the east and southeast converge. Its southern and southwestern frontier is marked by the Danube (ancient Istrus); its western and northwestern frontier extends far into the Hungarian plain; and its northeastern boundary is the Prut river, although from time to time it stretched to the Dniester by the incorporation of all or part of Bessarabia. Dobrudja abuts its Black Sea coastline, and this too has been attached to the core of modern Romania – the principalities of Moldavia and Wallachia – within varying boundaries at different times. The Carpathian mountains cut an arc through the country from northeast to southwest, separating those parts long under the influence of Constantinople and those which, looking to the Black Sea from Transylvania, the Banat, and Maramures, belong to the Danube basin and formed part of millennial Hungary before 1919.

The territory of modern-day Romania has been populated from the Palaeolithic period. The country's historical period begins in the 9th–8th centuries BC and is connected in southwestern Europe with the so-called Thracian Hallstatt period (*c.*600–550 BC), which corresponds to European Hallstatt C. Basarabi culture is considered the most representative of this new period within Romanian territory: the population was formed of mainly agricultural tribes living in fortified or open villages whose dwellings were constructed of timber.

The middle Danube was populated by the Tribali, a Thracian tribe, and Dobrudja by the Crobyzi and Getae. In Dobrudja the assimilation of the Getae and other Thracian tribes by the Dacians (from the second half of the 6th century BC) led to the creation of a Geto-Dacian culture. In addition to these tribes, Scythians inhabited both Dobrudja and Transylvania, introducing certain types of iron weapon, contributing to the development of art, and bringing certain features of Greek civilization to Transylvania. Greek influence reached the Geto-Dacian peoples more directly—via Greek colonies established on the Romanian Black Sea coast. The lands south of the Carpathians have yielded very fine examples of metalwork (helmets, greaves, goblets and other vessels, and a gilt rhyton), decorated mainly with zoomorphic figures, although human figures and floral and geometric ornament are not entirely absent. Some of these objects may have come from native workshops (Thracian or Getic); most, however, are from Asia Minor or the Pontic region, or are of Persian workmanship.

Histria was the first Greek colony on the Romanian Black Sea coast. It was founded by Milesians in the last quarter of the 7th century BC at the mouth of the Danube, and named accordingly. In the archaic period it was a small settlement of modest wattle-and-daub houses, surrounded by defensive walls. From the Classical period it grew: stone temples were built in the city's sacral area; stone dwellings were constructed, many with fine masonry, some with an upper storey; and the city minted its own coins. Histria became the centre of Hellenic culture in Getic lands. It was a centre of trade through which Greek goods penetrated deep into the hinterland. Its agricultural territory (*chora*) was populated by local people, who also formed a small part of the city's own population. In the Hellenistic period Histria doubled in size; new city walls were built, as were new temples. In the Roman period the city was enlarged further and yet new city walls and new temples were built. It remained a craft and trade centre until its destruction in the 4th century AD.

Another two Greek colonies, Tomis (modern Constanta) and Callatis (modern Mangalia), were established on the Romanian coast. Tomis, Ovid's place of exile, was established, also by Milesians, at the end of the 6th century BC. Excavation is very difficult, as the modern city lies directly above the ancient settlement; chance finds, however, demonstrate that it was an important craft and trading centre. In the Roman period it was decorated with marble sculptures, and mosaics were also found there. Callatis was established by Heraclea Pontica, itself a Dorian colony on the south coast of the Black

Sea. Archaeological material and inscriptions demonstrate that Callatis, sited in a fertile cereal-growing region, was a prosperous city.

At the end of the 4th century BC the Celts entered Transylvania, bringing with them a more advanced iron-working technology and the potter's wheel. Celtic tombs in this area contain fine metal objects and pottery. North of the Carpathians Celtic influence played a role of similar importance to that of the Greeks in the southern and eastern regions.

Under Greek influence the Geto-Dacians minted their first coins in the 3rd century BC, imitating those of Philip II and Alexander the Great. Assimilation of the different tribes and cultures was gradually completed. A similar process affected Scythians of the Dobrudja, who exacted tribute from neighbouring Greek cities in exchange for military protection: by *c.*AD 100 they had disappeared, the memory of their presence retained in the Roman name for Dobrudja – Scythia Minor.

In *c.*80 BC Burebista established the kingdom of Dacia and became its first ruler. Dacia reached its peak under King Decebalus, who fought against the Romans. The second Dacian War (AD 105–106) brought about the destruction of the Dacian kingdom and Roman conquest of the entire region. The importance of this to the Romans is shown by the erection of Trajan's column (*Tropaeum Traiani*) at Adamclisi in AD 109; this, the most important Roman monument on the lower Danube, depicts scenes of Roman victory in the war. Trajan made Dacia a Roman province. Because of its strategic importance, an outpost of empire in the hostile region north of the Danube, it was placed under direct imperial authority. Three legions reinforced by various auxiliary troops, a force of some 50,000 men, were permanently stationed there. Here Roman culture had a clearly military character. New Roman cities (such as Sarmizegetusa, Apulum, Napoca, and Drobeta) were established, as well as military settlements. The Danubian *limes* was strengthened by the construction of fortresses at such points as Axiopolis, Carsium, and Capidova. New cities (Tropaeum Traiani and Troesmis) were also founded in Scythia Minor.

The province of Dacia, extremely hostile to the Romans, could be held against frequent invasions by aggressive neighbours only at enormous cost in terms of money and manpower. In 271 the emperor Aurelius decided to evacuate the province. This led to a cultural retreat and Dacia's return in the 4th century to its old agrarian lifestyle. The departure of the Romans provided an opportunity for fresh tribes to fill the vacuum and invade this fertile region. This culminated in a period of mass migration by (seriatim) the Huns, Gepids, Ostrogoths, Avars, Slavs, and Protobulgarians, who fought each other as well as the Byzantines. Justinian was the last emperor to guarantee protection of the border on the Danube; it gave way in 602.

Byzantine remains are found in Histria and other Romanian Black Sea coastal cities and settlements. The history of post-Roman art in the region is closely linked with protonational

historical developments. Features of Roman and Byzantine origin were assimilated with Dacian tradition, whose wooden buildings gave way to stone architecture. The spread of Christianity over the course of the 4th century throughout the region south of the Carpathians, Dobrudja, and Transylvania exerted a deep influence on the art and artistic language of the Middle Ages, but interacting with historical factors peculiar to particular areas this common inspiration yielded a rich diversity of results. The influence of Byzantine Orthodox culture came to the area indirectly through a Serbian intermediary. This was of considerable importance for the development of indigenous Romanian art and architecture. No stone churches predating the 14th century survive in Romania, earlier ones being built of wood. Early stone-built examples have the usual Byzantine cross-in-square arrangement and basilican ground plans. The typical Romanian church has a distinctive form, Morava style, that developed in Serbia in the 14th and 15th centuries. Church painting echoed the techniques of 15th-century Byzantine art, and in later centuries was in keeping with late Byzantine trends (scenes are multifigured and small scale, with many tiers of paintings covering the walls from top to bottom). Jewellery and church utensils were either Byzantine or locally produced under Byzantine artistic influence. This was especially the case before the Tatar invasion of 1247.

Richly embroidered and adorned ceremonial garments dating from the 14th and 15th centuries are found, as well as jewellery of Byzantine craftsmanship (although western jewellery had also been introduced). The ladies of the ruling families were depicted in contemporary murals and embroidery wearing gold crowns of a characteristic shape decorated with pearls and precious stones, their shoulders and upper torsos draped in richly ornamented pendants, the whole redolent of Byzantine imperial dress.

The question of the ethnic origins of the modern Romanians has, in recent times, become embroiled with the rival national and territorial claims of Hungary and Romania in Transylvania. There is long gap in written sources, especially between the Roman/Byzantine collapse on the Danube and the re-establishment of Byzantine domination there 300 years later. Two rival theories have gained currency: that developed by Roessler holds that the modern Romanians have their origin outside the Carpathian area, while that known as continuous development holds that they are the descendants of the Daco-Roman population and the Slavs who through fusion and assimilation in the 7th–9th centuries, developed a "proto-Romanian" language.

The foundations of the modern Romanian state rest on a number of small feudal states (*terrae valachicae*), governed by chieftains, which were established in the 10th century. Over the succeeding centuries those to the west of the Carpathians were overrun by the kingdom of Hungary and settled by Saxon colonists. Those to the south and east, after two centuries of exposure to further invasion by Cumans and Tatars, and intermittent Hungarian involvement, were consolidated in the 14th century to form two large and independent principalities (Moldavia and Wallachia) with elected rulers. Dobrudja, formerly part of Wallachia, was conquered by the Ottoman Turks at the end of the 14th century. The two principalities, despite spirited resistance and the manoeuvring common in buffer states (seeking to play off Hungary, Poland, and the Ottomans), ultimately fell under Ottoman suzerainty (in the generation after the fall of Constantinople) but retained their separate identities, considerable autonomy (politically and culturally), and an appetite for using Hungary and Poland as some counterbalance to the Ottomans – who interfered in princely elections and might eliminate overambitious or restive princes. From the 17th century Phanariot Greeks (native or adoptive) became ever more prominent in both principalities, with families such as the Mavrogordato furnishing some 90 per cent of the ruling princes in the century up to 1812. Thereafter, modern nationalism, Ottoman weakness, and great-power patronage ushered the principalities towards *de facto* independence and unity in the 1850s under the native prince Alexander Ion Cuza, and full independence and the acquisition of Dobrudja in 1877 under his German successor. The creation of greater Romania followed in the aftermath of World War I (with the acquisition of Transylvania, parts of the Banat, Maramures, etc. from Hungary, Bukovina from Austria, Bessarabia from Russia, and various unreconciled minorities from all of them); various territorial amputations (some temporary – to Hungary; some permanent – southern Dobrudja returned to Bulgaria, and Bessarabia to the USSR) occurred during and as a result of World War II.

Romanos I Lekapenos *c.*870–948

Emperor

Romanos I Lekapenos (920–44) was a Byzantine emperor whose reign coincided with a period of military success and territorial expansion, a process that continued throughout the 10th century and reached its culmination during the reign of Basil II (976–1025). Romanos Lekapenos's family took its name from the town of Lakape, near Melitene, and was ethnically Armenian. Although of peasant background, Romanos had a successful military career as a naval officer. He held the post of *strategos* (commander) of Samos and eventually became *droungarios* or commander-in-chief of the fleet. Because of this important military command, he became a

pivotal figure in the struggle for the regency after the death of the emperor Alexander in 912. Romanos's political support was solicited by Theodore, the tutor of Constantine VII Porphyrogennetos (913–59), for help against rival claimants to the regency. In May 919 Romanos secured his position by repudiating the marriage pact already arranged by the patriarch Nicholas between Constantine VII and the daughter of the Bulgarian king Symeon by having his own daughter Helen marry Constantine instead, for which Romanos took the title *basileopator* (royal father-in-law), previously held by Symeon. Romanos also ordered the patriarch Nicholas to hold a Church council in 920 to reconcile differences between the proponents of Nicholas and the former patriarch Euthymios. This council issued canons condemning Leo VI's fourth marriage as illicit and allowing the third only under certain circumstances. Later, after the death of Nicholas, Romanos replaced him with one of his own sons, Theophylact. Following the conclusion of the council, Romanos charged the empress Zoe Karbonopsina, widow of Leo VI (886–912) and mother of Constantine VII, with trying to poison him and had her tonsured. Finally Romanos secured control of the regency by having the tutor Theodore exiled. After being declared Caesar, Romanos further strengthened his position by having himself crowned co-emperor with Constantine on 17 December 920. In 921–22 he decided to push the child emperor into the background and reserved most of the responsibility for governing the state to himself. Romanos would eventually have three of his sons, Christopher, Stephen, and Constantine, crowned as co-emperors, with Constantine VII remaining as the most junior of them.

Romanos was an effective emperor who initiated legislation that helped to protect small landholders against the encroachments of the *dynatoi* (magnates), who would buy out poor farmers and then use their position to obtain tax exemptions for themselves. Romanos believed that reform was necessary to protect the recruiting base for the army and to secure revenues for the state. In 922 he reversed the legislation of Leo VI by reinstating the right of preemption for relatives or neighbours in the sale of soldiers' land. The law enumerated five categories of neighbours who had preemptive rights in any alienation of peasant land. This was designed to prevent the transfer of land to large landowners unless they fitted into one of these categories. All soldiers' holdings that had been previously alienated had to be returned without compensation. The legislation created more problems than it solved. Many peasants were not interested in assuming control of this land again because of the onerous obligations it entailed. Of course, the local nobility were opposed to any legislation that expropriated them of their property. Eventually the situation in the countryside became worse as the famine of 927–28, resulting from bitter winter weather, imposed more hardships on the smallholders and led to the transfer of more land to the *dynatoi*. In 932 the rebel Basil attempted to take advantage of this discontent by staging an uprising in the Opsikion theme, for which he was eventually executed. In response, in 934 Romanos issued another decree that denounced the *dynatoi* and required the return of all land transferred since 928.

Romanos also enjoyed success in dealing with the empire's many enemies, especially Bulgaria. In 924, after receiving news of Romanos's usurpation and the cancellation of Nicholas's marriage pact, Symeon marched on Constantinople, but Romanos confronted him personally and successfully turned him away. After Symeon died in 927, Romanos was able to manipulate his successor Peter by having him marry one of his own granddaughters, Maria. On the eastern front the Armenian general John Kourkouas conducted several successful campaigns against the Hamdanids of Aleppo, the leading Islamic state at this time. John's victories eventually aroused the jealousy of Romanos which resulted in his replacement by the less talented Pantherios, a relative of the Lekapenoi. Romanos also suppressed revolts in Italy, the Peloponnese, and Chaldia.

A major change in Romanos's fortunes occurred after the death of his son Christopher, a bitter blow that seemed to sap his will to carry on. He later specified in his will that Constantine VII (son of Leo VI) would succeed him ahead of his own two sons, Stephen and Constantine. Fearing their impending loss of power these two brothers, with the backing of some courtiers, organized a coup against their father in 944. Romanos was overthrown and sent to a monastery; however, a month later, the two Lekapid sons met the same fate when they tried to assassinate Constantine VII, and were exiled to the same monastery as their father. Despite a plot to restore Romanos to power in 946, he spent the rest of his life on the island of Prote, eventually dying there on 15 June 948.

Romanos the Melodist, St

Hymnographer of the 6th century

Honoured on 1 October by the Orthodox Church as its patron saint of music, St Romanos the Melodist is also revered by modern scholars as Byzantium's greatest sacred poet. The

primary sources for his life and career are the short summaries of his lost *Life* transmitted in Byzantine Synaxaria and Menologia, to which one may also add the autobiographical references and other historical evidence found in his poetic works. These indicate that Romanos was born in the Syrian city of Emesa during the late 5th century, most probably to a Semitic (possibly Jewish) family. After his ordination to the diaconate, he was assigned to the church of the Resurrection in Beirut, where he spent several years before journeying to Constantinople during the reign of Anastasius I (491–518). In the capital Romanos served at the church of the Mother of God of the Kyros district, while also frequenting the all-night vigil (*pannychis*) at the city's important Marian shrine and stational church of Blachernae. According to the *Life*, his poetic gift was revealed when the Virgin Mary appeared to him during the vigil of Christmas at his home parish in Kyros with a scroll that she asked him to swallow. After acceding to her request, he mounted the ambo of the church and began to sing his famous hymn "Today the Virgin Gives Birth". The *Life* then records that Romanos went on to compose more than 1000 such hymns, the manuscripts of which were preserved in the church of Kyros, where he was eventually buried.

Today the figure of more than 1000 hymns is held to be a superlative form of praise for the Melodist. Only 85 texts bearing attributions to Romanos have survived, of which the editors of the Oxford edition of his works selected only 59 for inclusion in their volume of his *Cantica Genuina*. All of the latter belong to the early Byzantine genre of hymnography known anachronistically as the kontakion (the term refers to the scrolls from which the hymns were later sung), which Romanos is generally acknowledged to have brought to its apogee. The kontakia of Romanos are metrical homilies consisting of a short prologue (originally called a *koukoulion*, but later confusingly referred to as a kontakion) which serves to introduce the subject and refrain of the work, followed by a series of up to 40 longer and metrically identical stanzas known as *oikoi* that are united by an acrostic. Although the structural affinities between the kontakion and earlier forms of Syrian liturgical poetry have long been recognized, recent scholarship has also revealed cases of direct borrowing by Romanos from such Syriac sources as the *Diatesseron* of Tatian and the hymns of St Ephraim the Syrian, thus indicating that he may have been fully bilingual. The significance of other concordances noted earlier in the 20th century between the works of Romanos and Greek works that circulate under the name of St Ephraim, however, remains to be determined by future study.

The language of Romanos's genuine kontakia is an Atticized form of koine that, despite the poet's frequent use of rhetorical devices, remains fresh and direct. Particularly appealing are the many episodes of dialogue between historical or symbolic figures that occur in his hymns, in which Romanos demonstrates both a keen sense of drama and considerable psychological insight. These kontakia cover a variety of subjects: 34 are on the person of Christ, five relate other episodes from the New Testament, seven commemorate figures from the Old Testament, three praise martyrs and saints, and the remaining ten address other topics. Considered together, they constitute an almost complete cycle of hymns for the major fixed Christological and Marian feasts of the liturgical year, many of which were created or positioned in the Byzantine calendar during the reign of Justinian (527–65). To this fixed cycle may be added a second group of hymns for the movable seasons of Lent – notably including kontakia for the original Sunday cycle of Old Testament commemorations – and Easter. A number of the poems falling outside these main cycles of feasts were inspired by contemporary events. The hymns *On Earthquakes and Fires* and *On Baptism* relate, respectively, to the Nika rebellion of 532 and to the imperial edict issued in or around 528 requiring the baptism of all remaining pagans. Similarly, the only two genuine hagiographic kontakia of Romanos commemorate the Forty Martyrs of Sebastea, saints who were personal favourites of Justinian.

The discovery of a 6th-century papyrus containing a fragment of an authentic hymn by Romanos would seem to indicate that he became famous in his own lifetime. In the centuries following his death, his continuing popularity is attested to by the frequency with which the metrical patterns (and therefore the melodies) of his hymns were borrowed by later composers of kontakia, the existence of a body of (mostly hagiographical) hymns posthumously attributed to him, and his canonization at an unknown date. It also appears that for some time his hymns continued to be performed in their entirety within their original context of the Constantinopolitan service of *pannychis*. An episode in the 7th-century *Miracles of St Artemios*, for example, refers to the chanting of hymns by Romanos during a popular all-night vigil, while the 10th-century *Typikon of the Great Church* contains hints of similar practices at Hagia Sophia and its dependent stational churches.

During the 9th century the kontakia of Romanos were adopted by St Theodore of Stoudios for use within the monastic rite of St Savas as *mesodia*, i.e. compositions to be sung between the biblical odes and poetic canons of the Palestinian psalter. Although St Theodore and other Middle Byzantine hymnographers initially continued to draw on the poetry of Romanos as a source for their own hymns (mostly *stichera* and canons), whole kontakia began to disappear from the active repertory. Whatever the causes of this curtailment, one result was that Romanos's reputation as the Orthodox east's patron saint of music came to rest increasingly on the miraculous origins of his gift, which became the centrepiece for icons of the Protection of the Mother of God. In the 14th century, for example, Nikephoros Kallistos Xanthopoulos attributes the origins of the kontakion to Romanos by retelling the story of the Virgin's appearance during the vigil of Christmas. Echoed in the lives of the 14th-century musical saints John Koukouzeles and Gregory the Domestikos, this episode is cited directly in the post-Byzantine period by Agapios Landos in his devotional collection *Amartolon Soteria* (The Salvation of Sinners, Venice, 1641). Indeed, it is only with the publication, study, and translation of his works over the course of the late 19th and 20th centuries that Romanos has again become firmly established as Byzantium's preeminent sacred poet.

Romanticism

The protagonists of the Romantic movement drew their inspiration from themes connected with the revival of an idealized past. Chateaubriand's *Le Génie du christianisme* rallied the French Romantics around ideas associated with the sentimental reawakening of medieval Catholicism, while the Germans sympathized with Herder's rediscovery of a Gothic past. Although the German Romantics wished to break free from the heavily weighing tradition of Classical Hellenism, they owed a great debt to the forerunners of the Romantic movement, Hölderlin and Goethe, who remained unequivocally Hellenists throughout their poetic career.

The central Romantic themes of struggle with invincible powers, freedom, self-determination, and divinely inspired creativity were formidably expressed in the most significant works of Romanticism inspired by the Greek struggle for independence. Shelley's *Hellas*, Byron's *Giaour* and some cantos of *Childe Harold*, Delacroix's *Massacre of Chios* and *Greece Lamenting on the Ruins of Missolonghi*, Ary Scheffer's antagonistic treatment of similar themes accompanied by Victor Hugo's *Les Orientales* (*Chio ... tout est désert*), Beethoven's *The Ruins of Athens*, and Keats's New Hellenism dominated the cultural landscape of the first two decades of the 19th century and contributed to easing the controversy waged between the Classical and the Romantic. In this way a balance was restored between the Romantic Hellenism of Hölderlin, the Weimar Classicists, and the Romantic Philhellenism associated with the sympathizers to the Greek cause.

Romanticism, as an emotional reaction to the rationalistic spirit of the Enlightenment, infused the rediscovery of Hellas with the power of the sensation of *Gefühl*, understood as an intense feeling capable of producing interior states of revelatory insight in the mind and soul of the person who would surrender to its influence. The setting of the stage in the Greek War of Independence helped to resolve the conflict between the traditional-Classical and the modern-Romantic formulations as set forth by A.W. Schlegel. In both the Jena (1798) and the Berlin lectures (1801–04) Schlegel had contrasted the Classical literature of antiquity with the modern Romantic literature in which he included Shakespeare, Goethe, the folk poetry of the Spanish romances, the Scottish ballads, as well as the medieval romances of Charlemagne and the Nibelungen. A few years earlier, in the spirit of *Sturm und Drang*, Hamann and Herder had stressed the vitality of folk poetry, contrasting it with the dead letter of Classical poetry. The latter's collection of German popular poetry, *Stimmen der Völker in Liedern* (1778–79), advanced the notion that the folk poetry of a nation is imbued with the spirit of the people, the so-called *Geist des Volkes*, and that the national poetry expressed in vernacular speech is the authentic expression of the spirit of a nation, *Geist der Nation*.

Madame de Staël, greatly influenced by Schlegel, was instrumental in the dissemination of Romantic ideas in France. In 1813 *De l'Allemagne* was published in London, and two months later Schlegel's lectures were published in a translation done by her cousin, Madame Necker de Saussure. C.C. Fauriel had a first-hand knowledge of these ideas through his intimate association with Madame de Staël. His Preface to the *Chants populaires de la Grèce*, the *Discours préliminaire*, reproduced the pattern of thought of the German Romantics.

Set against this background, Solomos's Romanticism acquires a particular colouring inherited by the German Romantics. Even his impassioned defence of the demotic language, opposed to the dubious reforms of Korais, as presented in his *Dialogos* (1824), and the emulation of popular poetry in his own compositions point to Herder's unmistakable influence. From his correspondence it transpires that he was familiar with K. Ludwig Michelet's "neo-Christian spiritualism" and that he had studied attentively Hamann, Schelling, Manzoni, Speroni (who had also written a *Dialogo sopra le lingue*), and the circle of Italian Romantics associated with the literary review *Conciliatore*. Solomos had already put together

a collection of popular songs which were later offered to Nicolò Tommaseo, who included them in his three-volume *Canti popolari toscani, corsi, illirici, greci* (1841–42). However, what is of paramount importance is not Solomos's debt to the popular Muse, but rather the role that the German and, to a lesser degree, the Italian Romantics played in the consolidation of the arguments for the encouragement given to the predominance of the demotic language as the authentic medium for the expression of the Greek version of *Volksgeist*.

This particular streak of Romanticism associated with the authentic expressions of national idiosyncracies left its distinctive marks on all facets of Greek cultural, social, and political life in the 19th century. Linked to the theme of the revival of the past, it created a particular style in architecture known as the Neoclassical Romantic style in which Athens, Aegina, Nauplia, and other urban centres were built. Its main exponents, who were responsible for designing and building Athens as the new capital of the Greek state, E. Schaubert, C. and T. Hansen, E. Ziller, and S. Kleanthis, were all steeped in the tradition of German Romanticism. Both L. von Klenze and F. von Gärtner, who were responsible for some of the most representative works of German Romanticism in Ludwig I's Bavaria, were instrumental in giving Athens its Neoclassical look. This distinctive style was original enough to be imitated throughout the world's great cities, from Paris to Moscow and from Cape Town to New York. The same spirit, which had dictated a return to the forms of the past, penetrated other disciplines and influenced, through the pioneering work of K. Paparrigopoulos's national historiography, the theories about the uninterrupted continuity of the Greek nation – *to Hellenikon ethnos*, notwithstanding the incomprehensibility of this term to a Byzantine Greek – in the ancient, Hellenistic, medieval, and modern periods. It was also responsible for creating the new discipline of folklore (*laographia*) which under Nikolaos Politis was elevated to the rank of an authoritative branch of knowledge and painstakingly sought to find the origins of popular customs in antiquity.

An infinitely more complex form of Romanticism was cultivated in Greece by the Phanariots. The 18th-century *Mismagia* collections of poetry glorifying unrequited love are certainly the precursors of the melancholic mood with its despairing *Weltschmerz*, which thoroughly permeated the entries in the diary of P. Kodrikas, where the first instances of all gradations of sultry sentiment, sensation, and feeling – *aisthesis, aisthema, aisthetikon* – are tirelessly recorded in an endless succession for the years 1790–97. P. Soutsos, whom Hugo respected sufficiently to quote him in *Le Derviche*, is responsible for the first Greek novel, *Leandros* (1834), one more variation on the perennial theme of unrequited love, which ends in death and suicide, but in reality forming an elaborate pastiche made up from plagiarized paragraphs from Goethe's *Werther*, Lamartine's *Lac*, and mainly Chateaubriand's *René*.

Irrespective of the influences brought to bear on Romanticism from the Ionian or the Phanariot schools, the Romantic movement exercised a lasting power on Greek thought in the 19th century and tipped the scales in favour of the demotic language, the unquestionable sovereignty of the popular taste in poetry, song, dance, and discourse, the adoption of the distinctive Neoclassical style in architecture, and the idea of the uninterrupted continuity of the Greek nation. It was to this last concept that modern Greece owed one of the most tragic chapters of its recent history – the ideological deployment of the Great Idea and its disastrous conclusion in Asia Minor. In spite of its infelicitous ramifications on political thinking Romanticism infused the vision of new Greece with a dynamic vitality and produced some of the most representative works in literature and the arts, their echo still resonating with intensity well into the 20th century.

Rome

Largely through Magna Graecia, Greek influence on Roman life began to be felt at least as early as the 5th century BC. The *Sibylline Books* early acquired importance: kept beneath the temple of Jupiter Optimus Maximus, they are first recorded as being consulted in 496 BC. The cult of Apollo was introduced to Rome in 431 BC, and his oracle at Delphi was consulted in 398. As Rome's empire expanded, contact with the western Greeks increased; Greek art – particularly statues – arrived in large quantities on the capture of Syracuse, Capua, and Tarentum (211–209 BC).

Extensive Hellenization, however, began mainly in the 2nd century BC and chiefly as a result of Roman military conquest of the east, climaxing in Perseus of Macedon's defeat at Pydna in 168 BC and the sack of Corinth in 146 BC. More works of art came to Rome. (Polybius reports that in 146 Roman soldiers used Corinthian paintings as gaming boards, but more often captured artefacts were reverently or ostentatiously displayed in temples, villas, and public buildings.) Whole libraries also came: Aemilius Paullus took Perseus', and in the 1st century victors' spoils included libraries which had once belonged to Aristotle and Theophrastus; Pompey brought the medical works collected by Mithridates. And also, most importantly, there came the Greek personnel – refugees, political detainees like Polybius, educated slaves, many of whom were later manumitted – who could organize libraries and give instruction at all levels in Greek language, rhetoric, and philos-

ophy. Other visitors who whetted an appetite for such learning included Crates of Mallus, who lectured in Rome probably during the 160s, and the three philosophers who came as ambassadors from Athens in 155 BC. The presence of such figures contributed to an already strong Greek element in Roman education; increasingly in the 1st century BC Latin equivalents to Greek teaching materials were produced, but the principles remained Greek and knowledge of the language from an early age continued throughout the Roman period to be regarded as essential for members of the ruling class. (In literature Greek influence was also pervasive, as for instance in Plautus' adaptations of material from New Comedy in his plays.)

Some prominent Republican Romans were evidently philhellenic: for example Aemilius Paullus (d. 160 BC) and his son Scipio Aemilianus (185/4–129 BC), friend of Polybius. On the other hand Cato the Censor (234–149 BC) was one of those who publicly associated Hellenization with moral degeneracy, and the stereotype of fickle, unreliable Greeks – used on occasion for forensic purposes, for instance, by the otherwise generally philhellenic Marcus Tullius Cicero (106–43 BC) – remained commonplace into imperial times. But even Cato was fearful only, according to the usual modern view, of excessive Hellenization; he was himself well versed in Greek literature. By the 1st century BC Hellenism had clearly acquired an irresistible momentum. (On the other side, it seems to be in the late Republican and early imperial centuries that the double meaning of *Rhome* in Greek – Rome and strength – gave the city, and increasingly the cult of the goddess Roma, as Erskine has suggested, "a special aura in the eyes of the Greeks".)

Under the principate (as often earlier) it is not always possible – or profitable – to separate Roman and Hellenic elements in Roman culture. But there are some episodes and periods where one can be more specific. Augustus' rebuilding of Rome relied heavily on Greek expertise in working with marble and Athenian craftsmen in particular led the "neoclassical 'purification' of architectural decoration" (Torelli, 1996). Some of the most evidently Hellenic work was for Gaius Sosius' restoration of the temple of Apollo in the Circus Maximus. Nero indulged in public, in Rome as in Greece itself, in Greek athletics and singing to the lyre. The notably philhellene Hadrian (whose early nickname *Graeculus* indicates that resistance to such immersion was not yet dead) introduced many Greek elements into the decoration of his villa near Tibur (Tivoli) and brought a fresh wave of artists from the east to work there and on projects including the temple of Venus and Roma in the Forum Romanum. At the same time the status of non-Italians was changing: senators with origins in the Greek east, occasionally admitted since Augustus' day, were numerous by the reign of Trajan.

Once Constantinople was established as the Second or New Rome (terms in common use by the 6th century AD) Rome gradually declined in importance for the Greek world. Until final separation in the 8th century, however, the city's history is often dominated by its uneasy relationship with its eastern overlords. For a time, after the third and final recapture of Rome from Ostrogothic control by Justinian's general Narses in 552, the much-ravaged city benefited from Byzantine reorganization and repair. But in the absence of any lastingly effective imperial involvement, it was the popes (especially from Gregory I the Great (590–604) onwards) who came in practice to administer Rome and pay its soldiers. Nevertheless, in the early 650s the emperor Constans II could still (if not without resistance from Rome and Ravenna) arrest and later dethrone pope Martin I for non-compliance with his edict of 648 banning discussion of the imperially approved doctrine of Monotheletism (the single will in Christ); the papacy acknowledged Byzantine suzerainty and papal elections were, nominally at least, subject to imperial approval until the 8th century. (Byzantine coinage may have been minted in Rome as late as 781.)

A more broadly eastern influence was felt as a result of a long line of popes of Syrian or Greek background or descent between Theodore I (642–49) and Zacharias (741–52), and by the arrival of several waves of refugees: many fled the Arab incursions of the 630s onwards, and many fled iconoclasm, mainly in the mid-750s or after 816. (The papacy was by now sufficiently powerful to resist stoutly the iconoclastic edicts.) These new arrivals were mostly Greek-speakers and many of them were monks. Greeks had their own church in Rome at Santa Maria de Schola Graeca (subsequently Santa Maria in Cosmedin); Pope Paschal I (817–24) founded a monastery for them at Santa Prassede. Partly because of the presence of the refugees, the use of icons became more widespread in the city and other Eastern customs, notably the translation of martyrs' bones, gained acceptance.

As in earlier periods, Greek and Roman art can easily be too rigidly divided – some work was carried out by refugees from the East, but some, in styles more loosely inspired by Byzantine work, derived from common early Christian sources, or was distinctively adapted by local artists. In a number of cases, however, Byzantine influence seems to be generally agreed: in the fragmentary 8th-century frescos of Santa Maria Antiqua, for instance, and above all in the resplendent 9th-century mosaics of the chapel of San Zeno at Santa Prassede. With a few exceptions (there are, for example, evidently Byzantine elements in the late 13th-century mosaics at Santa Maria Maggiore and Santa Maria in Trastevere), such influences declined fairly rapidly once the papacy sought the aid of the Frankish kings against the Lombards from the 750s; this movement westward culminated in the crowning of Charlemagne as emperor in St Peter's in 800.

Summary

Greek influence reached Rome as early as the 5th century BC, and large-scale Hellenization began in the 2nd century BC. Roman art, literature, philosophy, rhetoric, and education were heavily Hellenized. Rome was less important to the Greek world after the foundation of Constantinople, but it remained theoretically subject to Byzantium until the 8th century AD.

Rumeli

The Ottoman name for the Balkan peninsula

Rumeli was the name given to the Balkan peninsula by the Ottomans. The Byzantine empire understood itself to be the inheritor of the Roman empire and Byzantine Christians called themselves Romans. Among the Muslims this translated into *Rum*, and the Arabs referred to the Byzantine empire as the *Bilad al-Rum* (Land of the Rum) or *Mamlakat al-Rum* (Country of the Rum). When Turkish Muslims conquered Byzantine Anatolia, they referred to this new territory as *Rum*, since it had belonged to the Byzantines. Once they had gained possession of the Balkan peninsula as well, they began referring to the Balkans as *Rum-ili*, a name they borrowed from the Latin term *Romania*, which originally designated the Byzantine empire as a whole. Anatolia was now more commonly called Anadolu, in order to distinguish it from Rumeli. As with the Byzantines before them, the Ottomans considered the northern boundary of Rumeli to be the Danube and the Drava rivers.

Although Anatolian Turks began settling in the Balkans as early as 1264, the Ottomans did not begin their conquest of the peninsula until the middle of the 14th century. The chaotic conditions obtaining at that time in both the Byzantine empire and the various Balkan states were of enormous help in allowing the Ottomans to extend their rule. Taking advantage of the Byzantine civil wars that pitted the supporters of John V Palaiologos (1341/55–91) against John VI Kantakouzenos, the Ottoman leader Orhan came to the aid of the latter. Orhan's troops routed the Serbian-Greek forces supporting John V and it was this victory, in 1352, that allowed the Ottomans to begin settling in Rumeli. Just three years later, in 1355, Stephan Dushan, the Serbian ruler whose state covered a vast area of the Balkans, died and the Ottomans were once again able to benefit from the civil wars that broke out after his death. By 1400, apart from the Dalmatian coast and some cities in the Morea, most of the Balkans were under Ottoman rule. Serbia, Bosnia, and Wallachia were vassal states and Byzantine possessions in the Balkans barely extended beyond the walls of Constantinople.

But Ottoman control of the Balkans was not yet assured. The Mongol defeat of sultan Bayezid at Ankara in 1402 dealt them a severe blow and handed the Balkan Christian princes the opportunity to reconstruct their states. They were not able to do so. Nor were the Europeans able to form a successful alliance against the Ottomans once the latter's fortunes recovered after 1413. It was the great victory at Varna, on 10 November 1444, that sealed the fate of both the Balkans and Constantinople. Murad II came out of retirement to defeat a Hungarian-Wallachian army, which had crossed the Danube and was marching towards Edirne, the Ottoman capital. With this defeat the European threat to Ottoman rule in the Balkans was effectively extinguished. Rumeli would remain an integral part of the empire until the early 20th century.

Significant numbers of Turkish settlers from Anatolia, both sedentary and nomadic, followed in the footsteps of the military beys who were constantly extending the borders of the Ottoman principality. Thrace, eastern Bulgaria, the valley around the Maritsa river, and the Dobrudja – all fertile areas which were conquered early by the Ottomans – were the regions of most extensive colonization. All received large numbers of immigrants from Anatolia in the 14th century. Turks would continue to form a large part of the population in these areas throughout the centuries of Ottoman rule. Turkish settlement was important not only in the countryside but in the cities as well. In fact, after the 15th century, Turkish immigrants from Anatolia settled almost exclusively in the cities, or else along the major military roads, so much so that the cities came to be associated with the ruling Muslim elite, while the countryside was the stronghold of Orthodoxy. Religious fraternities (*akhis*) played an important role in the founding of new cities, or, more commonly, the revitalization of existing ones. As the fraternities established themselves in urban centres, they petitioned the sultan for land that would sustain their religious and commercial activities in the city. Through these endowments (*waqfs*), which supported inns, baths, hospitals, fountains, bridges, and markets, the cities came to control substantial amounts of income from large rural estates. Such endowments were responsible for the transformation of Sarajevo, for example, from an obscure village into a major city in the 16th century. Edirne, Serres, Sofia, and Monastir, among others, owed their rapid development to this system of religious endowments.

Despite significant Turkish settlement in the eastern part of the Balkans, the Ottoman conquest of Rumeli did not dramatically alter the region's ethnic composition. There were no mass migrations similar to those of the Slavs during the Byzantine era, although Jewish refugees from Christian Europe in the 15th and 16th centuries did transform Thessalonica into a town with a Jewish majority. But certain demographic shifts, however minor in a relative sense, did come to acquire great significance during the period of nationalism and nation-state

creation. Building upon the Ottoman–Habsburg peace at the very end of the 17th century, Greek merchants established a series of trading posts stretching from the northern Balkans through Hungary, and into southern Russia. Greek commercial and then intellectual florescence in the 18th century accelerated the process of Hellenization in the Balkans, whereby Balkan Christians from other ethnic backgrounds became Hellenized through their contact with Greek culture. The vibrant Greek communities that developed in Wallachia and Moldavia at this time help to explain why the initial focus of the Greek revolution was the Danubian lands, not the Peloponnese which was very marginal to Greek life in the Balkans. The Serb lands had the misfortune of being right on the border between the Ottoman empire and its various Christian opponents. Serbs often took flight as a result of war, the most famous example being the large migration into southern Hungary at the end of the 17th century; more than 200,000 Serbs followed the metropolitan of Pec into Habsburg lands. The cumulative effect of Serbian migration was that, by the 19th century, Serbs had spread far to the north and west – into Croatia, Bosnia, and Hungary – of their original homeland and this fuelled the hope for a greater Serbia which would include the far-flung Serbian population in both the Habsburg and Ottoman empires. At the same time that the Serbs and the Greeks were moving north and west, mountaineers from the Albanian lands moved down into the recently vacated plains. "Old Serbia" came to have a majority Albanian population – those few Serbs who had remained became assimilated – and large numbers even made their way to southern Greece. The famous merchants and sailors of the island of Hydra were recent Christian Albanian immigrants.

If Turkish settlement did little to disturb the ethnic balance of the Balkans, Ottoman policy encouraged the maintenance of the religious status quo. The Ottomans in Rumeli were never concerned to convert the Christians to Islam. In fact, they moved decisively to protect the Orthodox Church, as part of a policy of encouraging the hostility that already existed beween eastern and western Christianity. The Balkan Christian peasants, who were, of course, the majority of the population, were already well disposed towards the Ottomans because the latter abolished the most onerous demands of the feudal system in the areas they controlled. Their sympathy for the Ottomans could only have grown as they watched their own landlords and princes bring in various Latin armies, such as the Hungarians, to help roll back the Ottoman advance. As the Hungarians waved the flag of Catholic crusade and made it clear that they considered the Orthodox to be schismatic, the Ottomans offered recognition and protection to the Orthodox Church, including generous terms for the monasteries on Mount Athos. Certainly the Orthodox patriarch of Constantinople benefited from the Ottoman conquest of Rumeli. Prior to 1453 the patriarch had had to watch helplessly as the Byzantines were pushed out of the Balkans and independent Serbian and Bulgarian Churches were established. His jurisdiction dwindled to the immediate environs of the capital city. After 1453 the Balkans were once again ruled from Constantinople and the sultan showed himself willing to let the patriarch move against autonomy-seeking bishops and metropolitans, although the Serbians, it should be noted, were able to regain their ecclesiastical independence in the 16th century. Ottoman policy towards the Orthodox Church in Rumeli is of the utmost importance in understanding why the Balkan peninsula remained largely Christian, despite 500 years of rule by a Muslim empire. A very different situation obtained in Anatolia where successive waves of Turkish conquest and immigration, beginning in the 11th century, succeeded in gradually changing Anatolia from a Christian to a Muslim peninsula.

Despite this relatively generous attitude towards the Orthodox Christians, conversion to Islam did occur in the Balkans and remains a hotly debated topic. The largest number of converts were to be found in Bosnia and Albania, where significant Muslim populations remain to this day. The inhabitants of certain parts of Bulgaria also accepted Islam and came to be known as Pomaks (as distinct from ethnic Turks, who were also Muslim, living in the Bulgarian lands). Not all conversions followed immediately upon the Ottoman conquest. The Albanians, for instance, did not convert in extensive numbers until the 17th century, while the Muslim population in Bosnia-Hercegovina was already strong by the time of the Ottoman provincial census of 1520–30. The *kaza* (district) of Bosnia was 18.4 per cent Muslim in 1489; in 1520 that number had soared to 46 per cent. Sarajevo was 100 per cent Muslim. Clearly a phenomenon that stretched out over many centuries cannot be explained by one factor alone. Historians have traditionally emphasized some balance of the legal and economic advantages that stemmed from conversion, the prestige of Islam, the willingness of Muslim missionaries to accommodate folk belief, and, finally, fear. Much empirical work remains to be done, however. For a long time, for example, historians believed that conversion to Islam in Bosnia-Hercegovina was explained by the prevalence of Christian heretical beliefs in this mountainous remote district. Conversion from one heresy to another, as it were, was relatively easy to do. Subsequent research, however, has thrown serious doubt on this theory.

Although the Ottomans had already lost Hungary by the end of the 17th century, they managed to hold on to Rumeli proper until the early 19th century. This did not preclude certain cities on the border – such as Belgrade – from going back and forth between the Ottomans and the Habsburgs with an almost monotonous regularity, nor did it prevent the Russians from making serious inroads on Ottoman sovereignty in Moldavia and Wallachia. Yet the first serious loss of territory came not from yet another clash with the Habsburgs or the Russians, but rather from a peasant uprising in 1821 on the southernmost tip of the peninsula that doggedly refused to go away. This turned into, of course, the Greek revolution and ultimately involved the Great Powers at the highest levels of diplomacy. With the Treaty of London (1830) the Ottomans lost this territory for ever. A long period of calm followed, but in just one short decade – the 1870s – the Ottomans were obliged to recognize the independence of Montenegro, Romania, and Serbia, as well as the entirely new state of Bulgaria. By the eve of World War I, all that remained of Ottoman Rumeli was the city of Constantinople itself and most of eastern Thrace. With the loss of Ottoman political control, Balkan Muslims began fleeing their homeland for the greater safety of Constantinople and Anatolia.

Summary

Rumeli was the Ottoman term for the Balkan peninsula as far north as the Danube and Drava rivers. By 1400 most of the Balkans were Ottoman territory and remained so until the late 19th century. Despite almost 500 years of Ottoman rule most of Rumeli remained Christian thanks to generous treatment of the Orthodox Church. By 1914 all that remained was Constantinople and eastern Thrace.

Russia

"Russia" is the designation customarily applied to (1) territories once constituting the Russian empire or the Union of Soviet Socialist Republics (USSR) in Europe and Asia; (2) those areas of Eastern Europe inhabited by Eastern Slavic populations (Great Russians, Ukrainians, White Russians); and (3) those areas of Europe and Asia constituting republics of the Russian Federation excluding Ukraine, Belarus, Moldova, and the Baltic republics. For the purposes of the following discussion, "Russia" shall designate that area of eastern Europe predominantly inhabited by peoples of Eastern Slavic origin on the territories of the Russian Federation, Ukraine, and Belarus, bounded on the east by the Ural Mountains and Caspian Sea; on the south by the Caucasus and the Black Sea; on the southwest and west by the present political borders of the Russian Federation, Ukraine, and Belarus; and on the north by the Arctic Ocean. Similarly, "Russians" shall denote persons of Eastern Slavic ethnic origin, including the Russians, Ukrainians, and White Russians.

The English "Russia" is a Latinized form deriving from Russian *Rossiya* and Greek *Ros* or *Rosia*, both coming ultimately from the Old Slavic *Rus'*, the exact etymology of which remains controversial, being said by some to derive from the Finnish *Ruotsi*, a corruption of Swedish *Rothsmenn*, "rowers", hence "seamen", or, by others, from the name of the *Roxolani*, a steppe people of Indo-Iranian origin known from the Greek and Latin sources.

Humans appeared in Russia about 30,000 years ago and several early to late Stone Age sites attest to this settlement. The transition from stone to copper occurred during a time that a highly advanced culture, called Tripolye or Cucuteni from the sites of its first discovery in Ukraine and Romania, began producing exquisite ceramic wares. This represents the northeasternmost of the cultural provinces of Old Europe, predating Indo-European settlement by two millennia. Fragments of Tripolyan ceramics have been unearthed in Greece and Palestine, indicating well-developed systems of commerce, while patterns used in Tripolyan art suggest parallels in contemporary Greece.

Beginning about 4000 BC, incursions of stock-breeding peoples, ethnically distinct from the Tripolyans, and possessing domesticated horses, carts, wooden ploughs, and bronze instruments and weapons disrupted the Tripolyan culture: these people, probably of Indo-European origin, belong to the corded-ware culture and introduced new social, cultural, and religious ideas. With them begins the Bronze Age in Russia. Evidence of continued connection with the Aegean cultural region is widespread: carvings and paintings of bulls' heads in graves and homes, characteristic ritual vessels, and clay statuettes of females with wide, pleated dresses recall parallels in Minoan Crete. In southeastern Russia, along the north Black Sea coast, related nomadic tribes settled down to stock breeding and simple agriculture, beginning intense production of bronze weapons using techniques learnt in Transcaucasia. These people, possibly identical with the Cimmerians mentioned in the *Odyssey* as living on the edge of the world, settled a broad area north of the Black Sea. Their *kurgans*, or burial mounds, have yielded rich finds of gold and silver objects showing the influence of Transcaucasian cultural centres.

Iron, first imported from Asia Minor, came into widespread use about 800 BC. Simultaneous advances in agriculture and architecture and in social and administrative practices were facilitated by the local occurrence of iron in Russia. Beginning in the 7th century BC, incursions of Indo-Iranian Scyths displaced the Cimmerians, whose invasion of Asia Minor was described by Herodotus in the 5th century BC. The Scyths, to whom Herodotus devotes a large part of his *Histories*, were divided into the "ploughmen" and "royal" Scyths, the former representing the local agricultural populations who had enjoyed several centuries of contact with the Aegean/Greek and the Caucasian/Asiatic cultural spheres. Contacts with the Greeks became more intense. Mentioned by Homer, Hesiod, Eumelus, and Arteinus in the 7th and 6th centuries BC, the peoples of the north Black Sea coastline came into the cognizance of Greek explorers and merchants. The tale of Jason and the Argonauts represents a mythic retelling of the expeditions of Greek mariners to new lands in search of gold and riches.

The Scyths established a kingdom between the Danube and Kuban and their raiders ranged into Asia Minor and beyond. In 513 BC the Persians under Darius I mounted an attack on the Scyths, who, though not entirely subdued, sustained sufficient

losses to stop their raids on Asia Minor. North of the Black Sea, in a climatic zone quite different from the Mediterranean climate to which they had been accustomed, Greeks established colonies, beginning around 650 BC. Of these, the most important were Olbia, called "the rich", located at the mouth of the Dnieper and Bug, and Panticapaeum, later capital of the kingdom of the Bosphorus (with Nymphaeum), predecessor of modern Kerch at the Cimmerian Bosphorus, providing access to the Sea of Azov (Lake Maeotis); the other cities commanded the mouths of the Dniester (Tyras), the Don (Tanais), and the Kuban (Phanagoria). Developing close commercial and social ties with neighbouring territories, these colonies drew them into the cultural and economic sphere of Hellas. Following their defeat by the Persians, the Scyths entered a period of decline, ultimately being replaced in their hegemony of the northern Pontic regions by the Sarmatians, an Iranian people, who held sway from the 2nd century BC to the 2nd century AD.

The kingdom of the Bosphorus, profiting from the trade of the district, became the major power in the area and a centre of culture and the arts, its coins being prized down to our own times for their beauty. The rich soil made the area an important source of wheat, the control of which had already become vital to Athens at the time of Herodotus. In return, the Scyths purchased Greek wares, which, traded far inland, reached finally into Prussia, whence the prized amber was imported. Together with the Scyths and Sindians, a so-called Bosphoran group emerged, whose influence spread westward into the Crimea. First under the Archaeanactids and, after 438 BC, under the Spartocids of Panticapaeum, a type of military tyranny was founded, which, developing into a Hellenistic monarchy, flourished for two centuries. Beginning around 250 BC, the Greek colonies entered a long period of decline. In the face of the influx of Sarmatians, the kingdom sought the protection of Pontus, whose king, Mithridates VI, defeated the barbarians, but also captured Panticapaeum and in 106 BC founded a new Pontic-Bosphoran state, which remained semi-autonomous under Roman rule, finally succumbing to the attacks of the Huns.

As elsewhere, the Romans were content to control this area through local powers, taking care that these local powers remained adequately strong and loyal. The ravages of the Germanic Skirians and Bastarnae and of the Getae in the 3rd to 1st centuries BC were checked by Roman arms and it was this protection which helped preserve the Greek colonies through difficult times to come. In the 2nd and 3rd centuries AD the region experienced significant prosperity, deriving from trade with the neighbouring barbarian tribes and with Asia Minor and the Caucasus. Much of the grain required for the Roman legions guarding the Danube was obtained from the area. Relations with the barbarians, such as the Sarmatians and Alans, appear to have been favourable, though this seems to have contributed to increased cultural influence by the

Sarmatians among the inhabitants of the coastline. The alliance of the Goths and Alans directed against Roman authority in the 3rd century was felt at Panticapaeum, which became a Sarmato-Gothic settlement.

The Greeks themselves do not seem to have penetrated far inland, since their geographical knowledge, beginning with Aristeas of Proconessus and Hecataeus of Miletus, is sketchy and often flawed. Herodotus provides a description of the Russian hinterland but includes fantastic descriptions of the tribes and conditions in those regions. Though Herodotus himself questioned the accuracy of what he had heard, later authors received and embellished these data with new inventions. Beyond the Scythian tribes and regions inhabited by strange races of men and monsters, there were the Rhipaeans, an impenetrable range of mountains, or a snowy desert punctuated with ill-defined lakes, and finally the Outer Sea or Ocean. The sole tangible highways were the large rivers at the mouths of which the Greeks had settled. The ancient geographers, including Herodotus, Ptolemy, and others, knew of a so-called Scythian route leading up the Don (Tanais) and Volga (Oarus), past Kazan, Orenburg, and Perm toward Central Asia and China, but the details are very confused and identifications depend on conjectures not always well taken.

Christianity in Russia dates to the 1st century, thus predating the conversion of the Slavs by eight centuries. The legendary *Lives* of St Andrew, one of the patron saints of Russia, affirm that the apostle reached the site of present-day Kiev, and Eusebius states that St Andrew did indeed preach among the Scyths. Whether the apostle did reach the northern shore of the Black Sea is not known, though contact with both Judaism and Christianity through the Bosphoran kingdom occurred at an early date. Early traditions state that pope Clement I, martyred under Trajan, was first banished to the Tauric Chersonese in southern Russia. The Pannonian *Lives* of Sts Constantine (Cyril) and Methodios tell of the translation of St Clement's relics to Rome, while some late Russian chronicles report that some of these relics were presented to the Kievan prince St Vladimir (?956–1015) after his conversion to Christianity. The Greek Fathers mention the Scyths and Sarmatians repeatedly, and bishops from Cherson or from the eparchy of "Gothia", that region inhabited by the Ostrogoths, are mentioned in the acts of the ecumenical councils beginning with Nicaea in 325. It is obvious that Christianity spread rapidly throughout the Hellenized regions of the north Black Sea coast and that even the Scyths and Sarmatians may have embraced the new religion.

Beginning in the 2nd and 3rd centuries, there were great movements of tribes from the east (Alans, Roxolani, etc.) and from the northwest (Germanic tribes such as the Gepids and Goths) into the north Pontic region. By about 200 the Goths had reached the Black Sea and begun to dominate large areas to the north. They destroyed Olbia, Tyras, and other cities in 251. Once the Goths had divided into the Ostrogoths and Visigoths, the Ostrogoths formed a large kingdom centred in southern Russia on the Dnieper. This kingdom reached its height under Hermanaric (reigned 350–75), who united all the Goths under his rule.

The appearance of the Huns in AD 375 led to the disruption of the Gotho-Alanic alliance and begins a new epoch in the history of the lands north of the Black Sea. From this time, hordes of barbarians, who had previously been checked in the north Pontic steppe, including the Avars and, later, the Khazars, Bulgars, and Magyars, found their way into Pannonia and the Balkans. While some of these tribes, such as the Avars, Bulgars, and Magyars, dissipated or settled beyond the borders of southern Russia, the Khazars were to remain a significant factor in the history of the region, ruling the left bank of the Dnieper and exacting tribute from the citizens of Kiev. The memory of their suzerainty over Kiev forms the basis of the story of the summoning of the Varangians out of Scandinavia by the Kievans, given as the central event in the founding of the state of Kievan Rus'. The immense wealth and strength of the Khazars derived from their control of the rivers Volga and Don and of the trade of the Black and Caspian Seas. Their power was finally broken by the Kievan grand prince Svyatoslav about 965.

Under Justinian and throughout the succeeding centuries, Byzantine policy had attempted to maintain some control over possessions north of the Black Sea. This was maintained, sometimes by military force, sometimes by treaties and tribute. Though these territories had never been fully integrated into the provincial system, cities sometimes quartered imperial garisons. The interest of Byzantium focused more keenly on the area because of the migrations of barbarians, such as the Bulgars, who passed through southern Russia in the late 7th century. By the mid-9th century both the Byzantine empire and its allies, the Khazars, found themselves confronted with dangerous developments in the region. Under Theophilos (reigned 829–42), the *klimata*, Byzantine possessions in southern Russia, were reorganized. Cherson was made their centre, and, as a theme, was governed by a *strategos*, or military governor. At the same time, Byzantine architects aided the Khazars in designing the fortress of Sarkel, which commanded the entrance to the Don from the Sea of Azov. The cause for this concerted action remains disputed, though there is much to favour the hypothesis that these measures were taken because of the appearance and expansive potential of the Kievan Rus'.

The north Pontic regions became an outpost of the empire against the Turkic steppe tribes, such as the Pechenegs (10th century) and Polovtsians (11th century), as well as against the Rus', both from Kiev and from their southern centre at Tmutarakan. In the 13th century the area came under the influence of the Grand Komnenids of Trebizond. The population was made up of diverse nationalities, including Greeks, Alans, Armenians, and Jews. In the 14th century the Genoese made inroads in the regional economy, establishing commercial centres along the northern Black Sea coast. The region was ravaged by the Mongols, first in 1222–23, then again in 1299, when Cherson was destroyed. After the fall of Constantinople (1453) and of Trebizond (1461), the area passed finally under the cultural and political influence of the Ottoman Turks and their subject Crimean Tatar khanate.

With the rise of the Slavs and, in particular, with the formation of the state of Kievan Rus', the influence of Byzantium in Russia becomes less political and more pronounced in the realm of culture, religion, and the arts. The conversion of Kiev to Christianity in 989 was a major success for both Byzantine political and ecclesiastical policy, since, with Vladimir's baptism, the last pagan and, at the same time, largest Slavic

nation came under the cultural influence of Constantinople. The energetic politics of Basil II, during whose reign this event occured, strove to maintain and increase the strength of the state; indeed, his political survival was due, in no small part, to the assistance of Vladimir and his Varangians. Nevertheless, the advent of the Turks in Anatolia in the second half of the 11th century turned the political attention of Byzantium towards the east, though the cultural development of the Kievan state was to remain under Byzantine influence for years to come.

The Russians belong ethnically and linguistically to the Eastern Slavic branch of peoples. Their language, together with those of the Ukrainians and White Russians, belongs to the eastern branch of the Slavic group of the Indo-European family of languages. Deriving from the "proto-Indo-Europeans", a grouping of seminomadic pastoralists who from about 4000 to 2300 BC had infiltrated the north Pontic regions, subduing and becoming assimilated with the resident populations, the Slavs arose as an Indo-European group distinct from neighbouring Baltic and Indo-Iranian tribes in a circumscribed area between the Vistula and the Dnieper, comprising Galicia, Volhynia, Podolia, and the middle Dnieper region. This corresponds with the development of the North Carpathian culture in this same area during the Bronze and early Iron Ages. In historical records the Slavs appear at the beginning of the Christian era, when their ancestral lands had already been penetrated by Germanic and Sarmatian invaders from the west and south. The "Veneti" were known to Pliny and Tacitus, while Claudius Ptolemy mentions the "Soubenoi", derived by Moszyński from *Slovene*, a tribe said vaguely to be living north of the Scythian lands and before the Imaos (Ural?) mountains. Only about AD 500, however, when the Sclavini are repeatedly mentioned by Procopius and Jordanes, is it possible to speak of an expanding, clearly Slavic culture. The state of the Antes, which occupied the regions of southern Russia and Ukraine, flourished from the late 4th to early 7th centuries, and was distinguished for its attacks on both Byzantium and on the Avars and Bulgars. By about 900, Slavs filled the large tracts between the Oder and the sources of the Dnieper and Don.

By this time development of distinctly Eastern Slavic culture had begun, coinciding with the growth of political centres at Kiev and Novgorod and the beginnings of the state of Kievan Rus'. The 11th-century *Primary Chronicle*, or *Tale of Bygone Years*, composed by Nestor, a monk of the Cave Monastery at Kiev, tells of the distribution of the Slavic tribes, such as the Polianians, the Severians, and the Derevlians, among many others, stretching from the region of Novgorod in the north to the delta of the Kuban river in Ciscaucasia. Bordering these tribes to the north were peoples of Finnish origin, who once occupied lands as far south as the upper reaches of the Desna and the Dnieper. In the west they bordered on Polish lands, on Great Moravia (which formed at the beginning of the 9th century), and on lands occupied by Magyars from the end of the 9th century. In the south their neighbours were the Bulgars across the Danube and the north Pontic regions, under Byzantine sway.

From the mid-9th century, with the legendary calling of the Scandinavian Ryurik to Kiev, the Rus' state grew to encompass the lands occupied by the Eastern Slavs. Their princes Oleg (d. 912) and Igor (d. 945) concluded commercial treaties with Constantinople, guaranteeing the rights of their merchants in Byzantine territories and including a pact of non-aggression. Igor's widow Olga, embracing eastern Christianity about 955, was baptized at Constantinople in the presence of the emperor Constantine VII Porphyrogennetos. Her son Svyatoslav dreamt of expanding his realm into the Balkans, but reverses against the Byzantines and his murder by the Pechenegs ended this phase of Rus' history. Svyatoslav's son, Vladimir I, acted to consolidate Kievan Rus' by unifying the Slavic tribes in a process begun by Igor and Olga. Vladimir himself was baptized around 989. Because of the increasing power of the emperor in the Byzantine Church and the implications of political subordination inherent in receiving Byzantine Christianity, Vladimir attempted to establish an autocephalous Church, even entertaining overtures from the Latin west. Vladimir's son, Yaroslav the Sage, received a metropolitan, Theopempt, from Constantinople in 1037, though a war in 1043 against the Byzantines and later disturbances (such as the appointment of independent metropolitans in the 11th and 12th centuries) show that neither Yaroslav nor his successors recognized the absolute political supremacy of the Byzantine emperors.

Though the Christian religion had been present in Russia since the 1st century, the conversion of the Slavs was a phenomenon of the 9th and 10th centuries. Beginning with the missions of Cyril (Constantine) and Methodios to the Khazars and their later activity in Moravia, Greek Christianity reached out to the nations of eastern Europe. While the patriarchs Photios and Ignatios stood in communion with a Russian eparch (probably at Tmutorokan) as early as 867, it was only the baptism of Olga and the later conversion of her grandson Vladimir that made Rus' a Christian state. Ecclesiastical exchanges proved the strongest link in the chain of Russo-Byzantine relations. With only two exceptions (Hilarion in 1051 and Kliment in the 12th century), all metropolitans of Kiev were Greeks. Similarly, about half of the other eparchs came from Constantinople, accompanied by their retinues of clerics and secretaries. These churchmen were instrumental in importing Greek artists, whose influence in determining the style of Russian art is obvious. However, despite the immense importance of Greek artists, the native Russians were not totally subservient to Byzantine tastes and developed a style uniquely their own. Similarly, the use of the old Slavonic language in Church literature and the liturgy was symbolic of the independent tendencies arising in Russia and of the ecclesiastical mentality, which differed in many respects from the spirit pervading Byzantine Christianity.

Beside the presence of Greek, later Byzantine, colonies along the north Black Sea coast, merchants established an interface of contact which comprised the so-called "great waterway from the Varangians to the Greeks". Beginning at the Baltic Sea and taking advantage of the numerous navigable rivers throughout Russia, traders ascended the Neva and Volkhov and then crossed overland to the headwaters of the Dnieper, which they descended in boats to the Black Sea. This route is described by Constantine VII Porphyrogennetos in *De Imperio Administrando*. Merchants traded in the emporia of the north Black Sea coast, such as Cherson (Korsun'), or went on to Constantinople, where their activities were regulated by commercial treaties. The major wares acquired at Constantinople included gold, silver, and glass vessels,

jewellery, ornaments, gold and silk textiles, as well as wine and dried fruits. The main Russian exports included furs, wax, and slaves, commodities also traded with western Europe, the Khazars, and the Arab world. The desire to secure the trade routes to the Black and Caspian Seas against the steppe nomads and the Khazars and Byzantines was probably one of the greatest motives behind expansive moves by the early Russian state, beginning with the attack on Constantinople by Askold and Dir in 860 and a later one by Oleg around 907.

Parallel to the commercial treaties, Byzantine law exerted no small influence on everyday life. The *Kormchaya Kniga,* the body of ecclesiastical law, was derived from the Byzantine *nomokanons,* the digests of canon law and imperial edicts touching on the Church. The ecclesiastical ordinances of Vladimir and Yaroslav also show Byzantine influence in some of their provisions. In the civil law the *Russkaya Pravda* is based in form and content on the systematic digests of Byzantine law, such as the *Procheiros Nomos,* or "handy law". As elsewhere, the Church did not attempt radically to change the law of the land in which it had been recently established, and many provisions of Byzantine law had to be modified or experienced lax enforcement.

As elsewhere in the sphere of eastern Christianity, monasticism proved to be a powerful cultural force in Russia. The first monasteries were founded in the 11th century, the most famous being the Cave Monastery near Kiev, in which St Theodosios (d. 1074) introduced the rule of St Theodore the Studite. Monasteries exercised notable social functions, for monks went abroad, recommending people to penance and devotion; they served the poor, but became important land-holding entities in their own right. Furthermore, their influence was magnified, for it was from the ranks of unmarried monastic priests that bishops were chosen. Monasteries were also involved in the colonization of the Russian north. Beginning with the earliest higumens of the Cave Monastery, monks travelled to the Christian east and there was early contact with Mount Athos. The first Russian monastery on the Holy Mountain was founded in 1169. The invasions of the Tatars interrupted these connections, but they were renewed at the end of the 14th century.

The beginnings of literature in Russia were also closely related to the Church and, with it, to Constantinople. Translations of the scriptures, of edifying works, and histories formed the models upon which original works were composed. Beginning with the *Primary Chronicle,* one is confronted with the use by Nestor of Byzantine sources and with the very fact of his compiling a work constituting a continuous, annalistic account of Russian history. Further examples are seen in the immense body of hagiographical literature, it too based on Byzantine models. Book illustration was also a monkish art with Byzantine roots, which developed luxuriantly on Russian soil.

The invasion of the Tatars in the early 13th century radically changed the political and cultural landscape of Russia. The destruction of Kiev resulted in displacement of political power to the northeast (Yaroslavl, later Moscow) and to Galicia, where a branch of the Rurikide line established itself at Galich and later in Lvov, before incorporation into Poland in the mid-14th century. The years of struggle against the Tatars reached fruition in the victory of the Russian armies at Kulikovo Pole in 1380. Over the next 100 years Russian policy slowly developed a theory of royal sovereignty, culminating in the marriage of Ivan III to Sophia, niece of the last Byzantine emperor, in 1472 and the adoption in 1480 by the same monarch of the title "tsar", renouncing the Tatar yoke and proclaiming the autocrat's independence of any foreign power. Within this time frame Bulgaria fell to the Ottoman Turks (1393), resulting in the emigration of Bulgarian intellectuals to Russia, one of whom, Kiprian, became metropolitan of Moscow. Constantinople, seeing the advance of the Turks, entered into a union of the Eastern and Western Churches at the Council of Florence (1438–39), but its fall in 1453 opened the way for Russian claims of its Church being the single, true representative of Orthodoxy. In 1551 the *Stoglav,* or Council of the Hundred Chapters, proclaimed Moscow's Orthodoxy as a model for the whole Eastern Church and in 1589 Jeremiah, the Ecumenical Patriarch, recognized Moscow as the Third Rome and its tsar as the "only Christian sovereign in the world".

The fall of Constantinople and the subjection of both the Greeks and their Church to the Ottomans after 1453 of necessity changed the relationship between Russia and the Greek world. While earlier Russian policy had centred on inheriting the spiritual legacy of the Byzantine empire, later tsars, beginning especially with Peter the Great at the turn of the 18th century, began looking to the Orthodox, primarily the Greek population of the empire, as a sort of "fifth column", potentially useful to Russia in the case of territorial expansion at the expense of the Turks. After 1764 the Russian government took an active role, portraying itself as the liberator of the Greeks, while, as a result of treaties, beginning with that of Küçük Kainarci (1774), Greek merchants came under the protection of Russian consuls with the privilege of flying the Russian flag. Later, the Ionian islands stood briefly under Russian protection, forming a nidus for the crystallization of interest in an autonomous or sovereign Greek state. Young Greeks, selected from principal Levantine families, were educated in Russia, many of them gaining wealth and often high rank in Russian service. Russian officers, among whom were several Greeks who had entered Russian service, including Count Ioannis Kapodistria, later president of the provisional Greek republic, became involved with efforts of the Greeks to throw off the Turkish yoke. In Odessa the so-called *Philiki Hetaireia* ("Friendly Society") was formed which, though the Russian government did not directly sanction or support it, became a major force in the organization of the Greek movement for independence. In general, however, Greek sympathy for and reliance on Russia was motivated by questions of religion and, throughout the late 18th and the 19th centuries, the Greeks were often disappointed by Russian policy resulting from changes in the tsars' political aims.

With the consolidation of the kingdom of Greece, Russian influence in Greek affairs declined throughout the 19th and early 20th centuries. During the Crimean War, despite British efforts, Greek public opinion, seconded by King Otho, supported the Russian cause and the Greeks invaded Thessaly and Epirus until a landing by French and English forces at the Piraeus forced Otho to abandon the Russian alliance. The Russo-Turkish conflict of World War I centred in the Caucasus and the end of Russian participation in the war in 1918 was

followed by large emigrations of ethnic Greeks from portions of Turkish territory into lands controlled by the nascent Soviet state. Russian influence now took the form of supporting revolutionary and leftist groupings in Greece, and Greek communists based their policies in part on ideas formulated by the Cominform. With the German invasion of the Soviet Union in 1941, Greek communists (KKE) formulated the fundamental duty of Greeks to participate in the defence of the Soviet motherland, forming the National Liberation Front (EAM) in September 1941. In 1943 agreements between Churchill and Stalin delineated Britain's and the Soviet Union's "interests" in Greece at 90 per cent and 10 per cent, respectively. In the Civil War (1946–49) which followed the close of World War II, communist support for political allies in Greece did not receive Stalin's complete backing, since a victory by communists in Greece was seen potentially to strengthen Tito's hand in gathering the Balkans under Yugoslav influence, while the importance of Greece to both the United States and Britain, the lack of a sufficient Soviet navy to aid the partisans, and the fact that the Soviet Union could not afford a confrontation with the West convinced Stalin that there was little hope of avoiding an eventual crushing of the revolt.

Greek influence in southern Russia continued into the 20th century. Living as they did along the shores of the Black Sea, Greeks gradually came under the political domination of the Russian empire. Some Greeks had been settled by Catherine the Great in the region of Mariupol in southern Russia (so-called "New Russia"), while others (mostly Pontic Greeks) migrated into Russian territory upon the withdrawal of Russian armies at the end of the Russo-Turkish wars of the 19th and early 20th centuries, settling mainly in port cities, such as Odessa, Sevastopol, and Rostov, in the Kuban steppe, and in Abkhazia and Georgia. After the Revolution of 1917 Greeks made notable cultural progress and Greek autonomous regions were established in some parts of the Ukraine and southern Russia. Beginning in the mid-1930s and continuing to 1949, Greek populations were decimated and up to 170,000 Greeks were exiled from southern Russia (especially the Crimean and Kuban regions) and the Caucasus, their lands were collectivized, and the people dispersed among Muslim communities in Central Asia. Following Stalin's death in 1953, some of these exiled Greeks began to return westwards and, after the dissolution of the Soviet Union in 1991, many Greeks, most of them of Pontic origin, began to emigrate to Greece. It is estimated that about 500,000 Greeks lived in the Soviet Union in the mid-1980s, at least half of them in Central Asia.

S

Sacrifice

Thought to be an important means of communication between divinity and mortals, sacrifice is a central feature of religious practice. In antiquity, although animal sacrifice was predominant, the offering of fruit and vegetables was also considered to be sacrifice. The mythological *aition* (origin) of the idea of sacrifice is believed to be the story of Prometheus in Hesiod's *Theogony* (521–616). Prometheus, representing mortals, hosts a dinner at Mekone (Sicyon) and purposely deceives Zeus by assigning for him a good-looking portion that consists of nothing but bones. There are references to sacrifice throughout ancient Greek literature, and with the help of archaeological finds such as vase paintings and votive reliefs we are able to reconstruct approximately what went on. The sacrifice probably consisted of three stages. There was a procession that led the animal to the altar, and a purification ritual in which the animal's head was cleaned with water and sprinkled with barley grain. Then followed the cutting of the throat, and finally the burning of the meat. The gods' portion was bones covered with fat; then the entrails and the meat were given to the participants for consumption. The entrails were observed by the priests because their condition was supposed to provide omens. That is why sacrifices were often made at critical moments in mythology as well as in history, before mounting an expedition or taking an important decision. Most cults and festivals (such as the Dionysia, the Bouphonia, and the Eleusinian mysteries) involved some form of sacrifice. Besides the official celebrations in honour of a god or goddess, where sacrifice plays a central role, sacrifices were made at major events in private life, such as marriage, childbirth, death, and were often accompanied by libations. Sacrifices could be organized at various levels, by a city, a deme, a family, or an individual. Young people of both sexes would offer sacrifices to Artemis before they got married. Pindar tells us about fireless sacrifice (*Olympian*, 7. 47). Burned sacrifices were believed (Philostratus, *Eikones*, 2. 27) to have first appeared in Athens, where they were conducted gloriously. The altar was the site of the sacrifice. The Classical Greek altar was stone-built and often decorated at the sides. As for human sacrifice, some scholars have argued that it was practised by the Minoan civilization, citing examples from myths such as that of Iphigeneia; but this is a theory that requires more research before it can be accepted.

Sacrifice was conducted to honour not only the gods but also heroes and heroines in corresponding cults. Very often the word *enagizein* ("make sacrifice to the dead") is used for heroic cults in contrast with *thuein* ("make offering to the gods"). Many heroes featured in the deme calendars that regulated the sacrifices that were to take place during the year. Most often the sacrifice was followed by a banquet, as in the cult of gods. In addition to blood sacrifice, libations were performed at the tomb of a hero, as on a funerary occasion, and votive offerings would be dedicated to heroic figures, most often objects (vases, shields, etc.) with artistic depictions inspired from the life of the hero. Some scholars have argued that there was sometimes ritual antagonism in sacrifice between gods, or between heroes and gods, as in the case of Erechtheus and Poseidon in Attica.

The concept of sacrifice and offering is believed to have survived in the Christian religion, as we know from the writings of the early Church Fathers. The notion of sacrifice exists in Greek Orthodox liturgical practice, at the Eucharist, in a reverse means of communication between the divinity and mortals. The concept that the Son of God was sacrificed in order to save mankind from sin creates a different model of communication, in which the divine initiates sacrifice and invites human participation. The sacrifice of Christ is symbolized in Holy Communion, in which the faithful receive his body and blood.

In modern Greek folklore tradition sacrifice is an important feature, reflecting the importance it had in antiquity. Sometimes it is done at important feasts, or in private life, particularly to mark certain rites of passage (at weddings, births, deaths), or in order to avert an evil. The ritual and the ideological form that it assumes justify labelling the act as a sacrifice and distinguish it from normal animal killing for the purpose of food. The act of sacrifice today is often seen as a clash between paganism and Christianity that has survived from the past, whereas in truth it shows the need of humans to express their feelings and convey a message to the divinity in material terms.

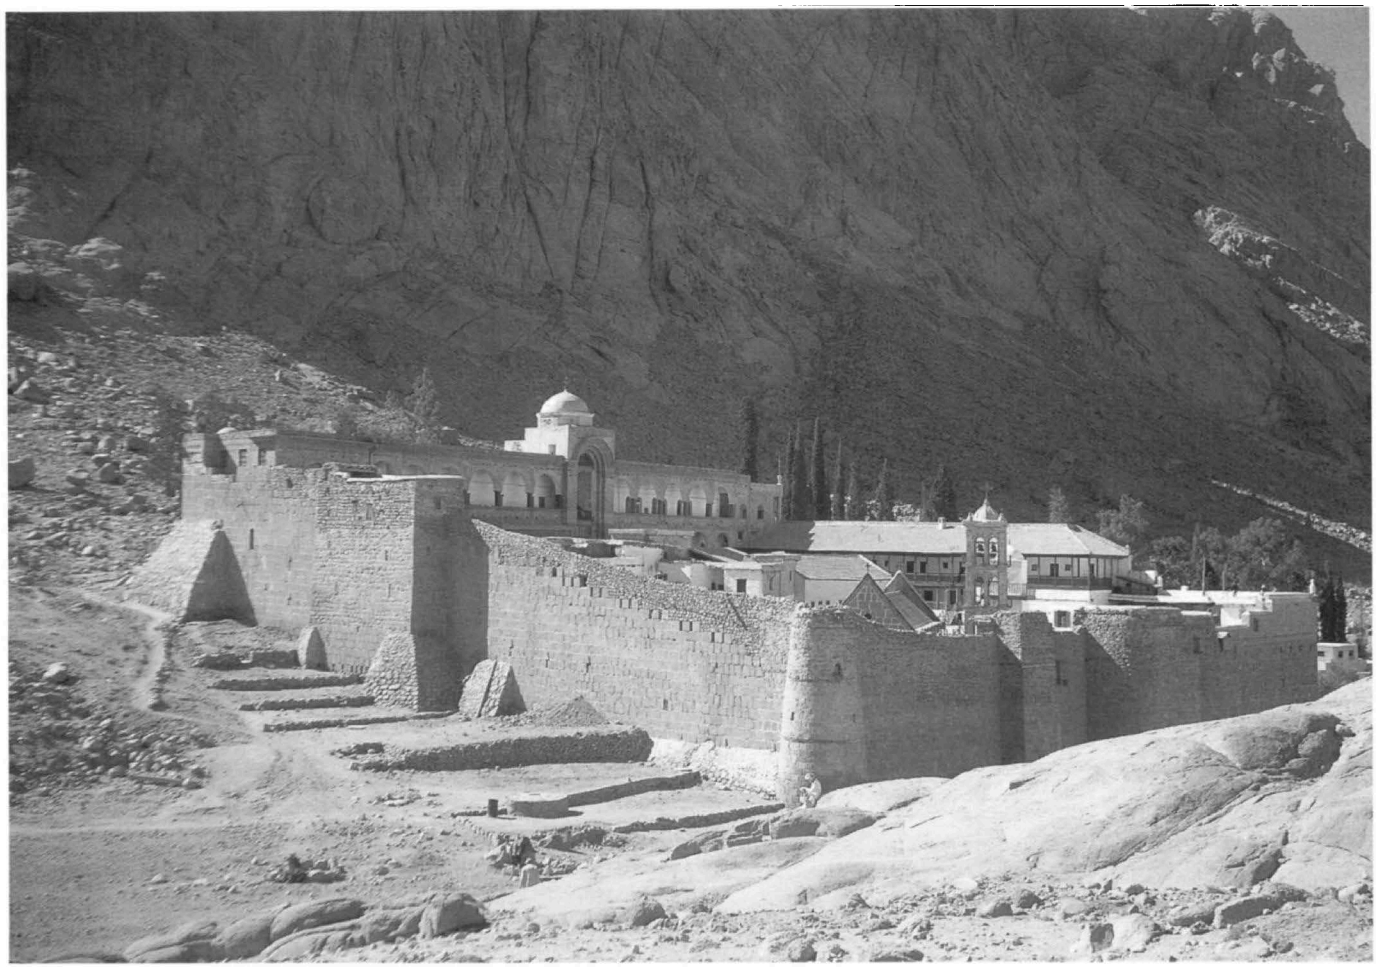
St Catherine's Monastery, Sinai

The monastery of St Catherine at Sinai is located in the southern part of the triangular Sinai peninsula, between the continents of Asia and Africa. It is unique in many ways: it is one of the oldest Orthodox monasteries, with an uninterrupted life of more than 14 centuries, during which it was never totally destroyed or abandoned. It is the only Orthodox monastery that is also the seat of an archbishop; it is also the smallest Orthodox diocese.

St Catherine's has the oldest monastic library in the Christian world and has preserved some of the best examples of early Christian icons (the earliest dating from the first half of the 6th century). The Sinai peninsula has been a monastic centre since the early days of monasticism. The proximity to Egypt as well as Palestine, the fact that it is sparsely populated, and the harshness of conditions made it ideally suited as a centre for anchorites, the early Christian monks who sought a life of isolation and prayer. The community of monks in Sinai (and neighbouring Raitho, now El Tor) was already in place during the reign of the emperor Diocletian (AD 284–305), when a number of them were slaughtered by the Blemmyes, a local marauding tribe. According to tradition (recently partly confirmed by archaeological evidence), St Helena ordered a fortified tower and church to be built on the site of the Burning Bush, in order to protect the monks living in the area from raids. Travellers and visitors of the 4th century refer to a small church and a fortified tower on the plain of the Burning Bush. (Egeria in 400 also reports the existence of a church on top of the mountain and on Mount Horiv.) In any event the tower already existed by 381 and pottery of the early Christian period confirms the existence of communities of monks.

The life of the monastery as we know it today began during the reign of the emperor Justinian (527–65). It is probable that the monastic community had grown in size and the earlier buildings were no longer sufficient. Justinian ordered a large basilica to be built near or on the site of the earlier structures and also a rectangular fortified protecting wall surrounding the church and the other buildings. The historian Procopius refers to the need to protect not only the monks but also the route from Egypt to Palestine as a motive behind the building of the fortress-monastery. The walls and the church (as well as some



St Catherine's Monastery, Sinai, where there has been an unbroken tradition of asceticism since the 6th century

of the buildings inside the walls) were designed and built by Stefanos, from nearby Aila (now Eilat). Apart from imperial funds, Stefanos also had at his disposal a contingent of soldiers. Some 200 of them with their families settled around the monastery to help protect it, but also the imperial communications. The monastery soon became well known: pope Gregory Dialogos (590–604) financed the building of a hospital; and other dignitaries in East and West also endowed it with property.

The monastery found itself outside imperial jurisdiction quite soon; the Arab conquest of Sinai (633) and the conversion of the inhabitants of the peninsula to Islam left the monks the only Christian population in the region. However, on the whole neither the monastery nor the monks were greatly affected: they had secured from the Prophet Muhammad himself the *Ahtiname*, a document signed by Muhammad with the imprint of his hand, in which his followers were asked not to molest the monastery, which was also given tax privileges. Moreover, being outside the empire, the monastery escaped the depredations of iconoclasm in the 8th and 9th centuries. While the monastery has had periods of trouble (e.g. in the reign of the caliph Hakeem, 1101–06), the *Ahtiname* has always been recognized as genuine by Muslims. This and the diplomatic conduct of the monks have ensured a largely peaceful coexistence between the dominant faith in the region and the monastery.

Originally named after the Burning Bush, the monastery changed its name to St Catherine in the 9th century, when the saint became known in the West. Greater prominence was achieved in the 11th century largely through the efforts of a monk from Sinai, Symeon Pentaglossos ("of the five tongues"), who took some relics of St Catherine to western Europe. Following this and other tours, the monastery received donations of property throughout Europe and other privileges, confirmed by papal bulls of Honorius III (1217), Gregory I (1271–76), and John XXII (1316–34). Venice granted tax exemptions to the monastery for its dependencies in Crete; and after the Turkish conquest of Egypt and Sinai (1517) sultan Selim confirmed the privileges. He also took the original *Ahtiname* to Constantinople, leaving copies in the monastery. Even Napoleon issued an edict confirming the monastery's privileges in 1798; his army also repaired one of the walls of the monastery which had collapsed following heavy rain that year. The monastery received considerable patronage from Russia as well; apart from gifts of land, both Catherine the Great and Alexander II donated reliquaries for the relics of St Catherine.

Within the formidable walls of the fortress lies the complex of monastic buildings. These include the main church and numerous chapels, the old refectory, the library, a mosque (for the local bedouin), a mill, and many other buildings. The monastery church was probably originally built in honour of

the Transfiguration, as the magnificent mosaic in the apse attests. Evidence from inscriptions on the beams supporting the ceiling suggests that it was built at some time after the death of empress Theodora (548) and before the death of Justinian (565). It is a three-aisled basilica with a narthex at the west end. On the east, south, and north sides it has nine other chapels dedicated to various saints. Of particular interest is the chapel of the Burning Bush on the eastern wall of the church, behind the chancel. Among its many remarkable features are the doors to the main church dating from the 6th century and the doors to the narthex (from the period of the crusades).

Other notable buildings include the mosque (a Byzantine building, formerly the monastery's refectory and turned into a mosque early in the 12th century) and another building of unknown use from the 12th or 13th century. This has Gothic arches and a fresco of the Second Coming (dated 1573). Graffiti in Latin on its arches seem to imply that it was used as quarters for pilgrims from the West. The monastery of St Catherine of Mount Sinai has preserved priceless architectural, artistic, and cultural treasures as well as its Greek Orthodox tradition. It has also been and continues to be a unique (if lonely) Greek and Orthodox Christian beacon in the Sinai wilderness.

Summary

Founded in the mid-6th century by the emperor Justinian I on the traditional site of the Burning Bush, the monastery has enjoyed good relations with neighbouring peoples throughout its existence. It changed its name to St Catherine in the 9th century. Still functioning as a Greek Orthodox house, it preserves a unique collection of architectural, artistic, and cultural treasures.

Sakellarides, John Theophrastos

*c.*1853–1938

Composer and teacher of music

The life and work of John Theophrastos Sakellarides, teacher, arranger, and reformer of Byzantine chant, is of fundamental importance for understanding the development of sacred music in the Greek Orthodox Church since the late 19th century. Born *c.*1853 in Litochoros, Olympus, outside the Greek kingdom, he received his first instruction in Byzantine chanting from his father, a priest. Sent to secondary school in Thessalonica, he continued to study chant under the noted cantor Papa-Theodoro Mantzourani, a former Constantinopolitan, who also taught the young Sakellarides Arabo-Persian music. He then enrolled in the medical school at Athens university, transferring later to its school of philosophy. During this period he secured the first of his many cantorial positions in the Athens area, while also studying Western musical theory under a German teacher at the recently founded Athens conservatory.

Sakellarides's encounter with Western music proved decisive, causing him to reject many elements of the received tradition of Byzantine chanting as relics of Turkish domination. He began to view the repertories of florid chant as bodies of formless creations in which the meaning of the text was obliterated by senseless melismas, and to criticize traditional vocal production as barbaric *rhinophonia* (nasal singing). Thereafter he cultivated a more Western manner of singing and embarked on a mission to purify Byzantine chant through a radical recomposition of the central repertory. He simplified or eliminated most melismatic chants, while rewriting many of the less florid chants to conform to his classicizing theories of metre and punctuation. In 1880, while still at university, he published his *Christomatheia Ekklesiastikis Mousikis* [Handbook of Church Music], a book of liturgical music in modern Byzantine notation containing a theoretical prologue recommending the adoption of equal-temperament tuning, followed by a compendium of the most frequently encountered chants for the Divine Liturgy and major offices. This volume was soon followed by others in both Byzantine and Western staff notation, some of which also contained elementary harmonizations in two, three, and occasionally four parts. Sakellarides justified the latter innovation with citations of Classical and patristic texts, dubiously interpreting references to *harmonia* as evidence for harmonized singing in the modern Western sense. Moreover, he defended his harmonizations – often little more than parallel thirds or sixths over a rudimentary bass part – as *triphonia* (three-voice music) not subject to the recent synodal and patriarchal proscriptions of *tetraphonia* (polyphonic compositions, usually in four parts). These rationalizations did not prevent his censure in 1886 by the Holy Synod of the Church of Greece for breaking the ban on polyphony with his choir at the church of Hagia Eirene, as well as for having introduced female voices into his ensemble. Although the synod's action forced him to resign from Hagia Eirene, it did little to stem his rapidly growing popularity. The subsequent accession of a new archbishop from the Ionian islands brought Sakellarides toleration followed by official sanction as he successively assumed musical directorships at the most promi-

nent churches of Athens, including its cathedral. Attracting large crowds wherever he went, he was renowned for the clarity of his tenor voice, his diction, and for inviting the congregation to participate in certain of his simplified chants with the command "*Laos!*" ("People!"). He eventually returned to Hagia Eirene, where he remained *protopsaltes* (chief singer) until his death on 15 December 1938.

Prior to the Asia Minor disaster of 1922, Sakellarides worked vigorously as a composer and teacher to reconcile the musical cultures of ancient Greece, Byzantium, and the contemporary West. In addition to producing a comprehensive repertory of reformed chant that was constantly republished, he wrote incidental music for three Classical dramas and composed a large number of patriotic songs intended for use in schools, many of which appear in his nationalistic collection *Tyrtaios* (1907). Sakellarides personally taught his music to nearly two generations of Athenian clergy and laity (both men and women) at such institutions as the Rizarios seminary and the Arsakeion school for girls. His firm belief in the fundamental unity of Greek musical culture through the ages took him and his three children to Munich in 1903, where they presented lecture-recitals of sacred and folk music. These included a concert featuring the participation of the Munich Philharmonic Orchestra under the direction of his son Theophrastos, a composer of operetta who had orchestrated the music performed on that occasion. Back in Athens, from 1904 to 1907 he instructed the young H.J.W. Tillyard, a future cofounder of the *Monumenta Musicae Byzantinae*, in the received tradition of Byzantine chanting, thereby influencing the subsequent course of Byzantine musicology in the West with his reformist views.

Sakellarides continued to clash with traditionalists even after his *Hiera Hymnodia* [Sacred Hymnody] – which contains among its chants for the Orthodox wedding service such curiosities as a Greek adaptation of Wagner's famous march from *Lohengrin* – was recommended for general use by the Holy Synod and ministry of education in 1902. In that same year he provoked a public disturbance by attempting to provide piano accompaniment for the public final examination of one of his chant students. His 1904 transcription of an acclamation for the last Byzantine emperor from a medieval manuscript precipitated a bitter debate in the periodicals of Athens and Constantinople regarding the true nature of chant in Byzantium. This was also the first of many conflicts with the newly arrived Constantinos Psachos (*c.*1866[–]1949), another student of Mantzourani who had just been sent by the ecumenical patriarchate to direct a school of traditional Byzantine music at the Athens conservatory.

The influence of Sakellarides on liturgical music in Greece began gradually to wane after the 1950s. By the late 1980s a revival of traditional Byzantine and folk music had relegated the vast majority of Sakellarides's reformed chants to the musical periphery. An exception to this trend is his melody for the vesper hymn *Phos Hilaron* [Hail Gladdening Light] which has all but completely displaced the ancient chant even on Mount Athos. For a variety of cultural and historical reasons, the music of Sakellarides has proved far more durable in the Greek Orthodox churches of the West. This is particularly true of the United States, where his reformed melodies were so widely disseminated during the heaviest periods of Greek immigration that they have since come to be regarded by most people as traditional. Yet with the rise of professionally trained Greek-American musicians, Sakellarides's elementary harmonizations have largely given way to more sophisticated modal arrangements by such composers as Frank Desby, Anna Gallos, and Tikey Zes.

Biography

Born *c.*1853 at Litochoros on Mount Olympus, Sakellarides was educated in Thessalonica and Athens where he was a student at both the university and the conservatory. He introduced Western elements into Byzantine chant which brought him censure from the Holy Synod of the Church of Greece but great popularity. His influence on liturgical music has waned since the 1950s. He died in 1938.

Salamis (city)

City in Cyprus

Unlike Paphos, which had a predecessor in the Bronze Age and even earlier at the same location, Salamis is a relatively new foundation, dating to the 11th century BC. Its Late Bronze Age predecessor Enkomi lies *c.*2 km inland, to the southwest. Around the beginning of the 11th century BC the inner harbour of Enkomi silted up, perhaps as a result of earthquakes, and the town was gradually abandoned; its inhabitants chose a site near the sea, which was provided with a natural harbour, and the town of Salamis developed around this harbour. Judging from the perimeter of the 11th-century BC fortification wall, the early town was small, with its necropolis situated *extra muros* to the west. Of the 11th century BC only one sanctuary has been excavated, as well as a portion of the city wall, but there is ample ceramic evidence that the town originated at that time. This is also supported by the discovery of a tomb of the same period, west of the harbour, with a long narrow *dromos* (entrance passage) and a rectangular chamber, of a

Salamis: the ancient city viewed from the air. In the foreground the gymnasium and to the right the theatre which dates from the 1st century AD.

type which was introduced to the island from the Aegean. According to mythical tradition the founder of Salamis was Teucer, the son of Telamon, king of the island of Salamis (near Attica) and brother of Ajax, who came to the island after the end of the Trojan War. Underlying this myth may be the phenomenon of the foundation of new towns by Achaean immigrants of the 12th century BC, after they finally established themselves on the island and gained political power.

Salamis of the Dark Ages (10th and 9th centuries BC) is not represented in the archaeological record, but the 8th–7th centuries BC are represented by a number of large built tombs with monumental *dromoi*. Although the chambers of these tombs have been found looted or half-looted, many important objects were found in the spacious *dromoi* which the looters left intact. The size of the tombs, their style, and the wealth of objects which they have yielded justify their identification as "royal", although not all of them were used for the burial of members of the royal family. As in other tombs, at Salamis too there must have been an aristocratic elite, probably the descendants of the Achaean immigrants of the 12th–11th centuries BC. The burial customs which have been observed for these "royal" burials are remarkable: the dead person was placed in a ceremonial chariot or hearse, drawn by two or four horses, and was carried to the tomb. The chariots and horses were richly adorned with bronze plaques and gear respectively, all decorated in repoussé with Egyptianizing scenes. The chariot was drawn down the slope of the *dromos* to near the entrance of the chamber. There the horses were ceremonially killed. The sacrificing of horses in honour of the dead recalls Mycenaean burial customs. In one case there is evidence for the burial of slaves in the *dromos* of a tomb to serve their master in the afterlife. Among the tomb gifts there were weapons and ivory furniture (a bed and a throne were found in Tomb 79). There were also iron skewers (*obeloi*) and firedogs of a type known on Crete and in the Argolid during the same period. The burial customs of the "royal" tombs of Salamis, as well as the gifts offered to the dead, recall customs and objects mentioned by Homer in the *Iliad* (book 23, where the burial of Patroclus is described). This has led some scholars to interpret the appearance of such burial customs at Salamis as the result of the reciting of the Homeric epic in the court of Salamis. The most plausible explanation, however, is that such "heroic burials" also existed on the Greek mainland, and it was quite natural for the aristocratic elite of Salamis to imitate these burial customs.

Salamis maintained close relations with Greece throughout its history. In a "royal tomb" of the 8th century BC a large number of Greek Geometric bowls and dishes were found, as well as a *krater* (mixing bowl). The dead person, a woman, was cremated and her incinerated remains together with her necklace were put in a bronze cauldron. Gjerstad ingeniously proposed that this was the tomb of a Greek princess who had married into the royal court of Salamis.

Salamis of the late-Archaic and Classical periods is known from tombs as well as the votive offerings belonging to a sanctuary on the western outskirts of the town. The style of the limestone statues, most of them female, imitates that of the

Greek *korai* of the end of the 6th and the beginning of the 5th century BC.

The earliest king of Salamis whose name is known is Euelthon (560–525 BC). He was the first to issue silver coins on the island in 530 BC. Herodotus (4. 162) records that queen Pheretima of Cyrene visited Euelthon in 530 and asked for his assistance in re-establishing her son on the throne. Herodotus also mentions Euelthon as having dedicated an incense burner at Delphi, which could be seen in the treasury of the Corinthians. Another Salaminian who offered a *peplos* (robe) at Delphi, woven by himself, was Helicon, son of Acesas.

Herodotus describes very vividly the dramatic events connected with the Ionian revolt and the active participation of the Salaminians under their king Onesilus (5. 104, 108–16). The latter managed to dethrone his brother, the pro-Persian king, and lead the revolt. He died while besieging the pro-Persian kingdom of Amathus.

One of the most famous kings of Salamis was Evagoras I, probably a member of the Teucrid royal family and a great supporter of Athenian policies. He was honoured by the Athenians, who erected his statue in the Agora of Athens next to the statue of Zeus Eleutherios. His ideal was to unite all the Greeks under the leadership of Athens. In Cyprus his efforts were to unite all Cypriot kingdoms under the leadership of Salamis in order to free the island from the Persians. Neither of these ideals was fulfilled. He fought against the Persians and helped the Athenians against the Lacedaemonians. He died in 374/73 BC, a few years after the Peace of Antalcidas was signed in 386, which decreed that all cities of Asia and Cyprus should belong to the Great King. The Greek orator Isocrates praised Evagoras in one of his orations; Isocrates was the tutor of his son, Nicocles.

A funerary monument, the cenotaph of the last king of Salamis Nicocreon, was excavated in the necropolis of Salamis. On the funerary pyre, under the tumulus of earth, the Salaminians buried rich gifts for the brave king and the members of the royal family who preferred to die rather than surrender to the Ptolemies. This event, narrated by Diodorus, is dated to 311 BC. The burial may have been effected by Demetrius Poliorcetes, who became the ruler of Cyprus in 306 BC.

Salamis continued to be one of the most important cities of Cyprus, but with the transfer of the capital to Paphos in the 1st century BC the city must have lost some of its glamour. Its harbour and its rich hinterland, however, contributed to its continued prosperity. During the Roman period the city enjoyed the favours of Trajan and Hadrian, who erected public buildings such as the gymnasium and the theatre, which they adorned with marble statues. The temple of Zeus Salaminios was considered to be one of the most important religious centres in the island. Recent excavations have revealed some of the splendours of Salamis in the northern part of the town including a gymnasium, a theatre, an amphitheatre, a *xystos* (colonnade), and spacious baths.

The city was destroyed by the earthquakes of the 4th century AD, after which it was reconstructed on a smaller scale as a Christian city, named Constantia in honour of the emperor Constantius II, who assisted in its reconstruction.

Summary

The largest city of ancient Cyprus, Salamis was said to have been founded by Teucer, brother of Ajax, after the Trojan War. Remains date from the 11th century BC. Relations with Greece were close throughout antiquity. Evagoras I, king of Salamis in the 4th century BC, was honoured by the Athenians for his support. The city lost some of its importance when the capital was moved to Paphos in the 1st century BC.

Salamis (island)

Island in the Saronic gulf

The island of Salamis sits off the western coast of Attica. It is the northernmost island of those which lie in the Saronic Gulf. The island is approximately 100 sq km in area. The terrain is mountainous, with some arable plains. There are no rivers running on the island today. The vegetation consists largely of pine, scrub oak, and olive.

The island was inhabited from at least the Neolithic period. Excavation in a cave on the south coast of the island has produced numerous stone implements. In addition, prehistoric pottery has been found at various spots on the island. The Bronze Age is well represented by tombs and pottery, both of which have been found all over the island. The remains of a Bronze Age settlement may be seen at Ginani in the southern part of the island. A large sub-Mycenaean cemetery was excavated on Salamis around the start of the 20th century. It yielded much pottery, some of which came from Attica. There

was thus a connection of some kind between the two places from an early period.

Although the centuries between 1000 and 800 BC are less well represented, there is some evidence of habitation, and from the Archaic period through to the present there is clear, continuous habitation. While the area most heavily inhabited in the Bronze Age seems to have been the southern section of the island, in the Archaic and Classical periods the settlement moved north to the middle of the island. The Classical city sat on a peninsula on the east which juts out towards Attica. Later, at a date which is still not certain, the principal settlement moved to the west coast of the island, and this city (modern Salamina) is still the principal city on Salamis.

The mythology of the island is related by the 1st-century BC historian Diodorus Siculus, among others, who says that Telamon and Peleus killed their brother Phocus on the island of Aegina, and then Peleus fled to Thessaly and Telamon to Salamis. Telamon, according to one version of the story, was then married to the daughter of the king of Salamis, and they had a son, Ajax. When the old king died, Telamon inherited the island, and one of his grandsons in turn gave it to the Athenians. (Peleus married Thetis and she bore him Achilles. Thus Achilles and Ajax are cousins.)

The close ties between Athens and Salamis are further demonstrated by the earliest Athenian decree (late 6th century BC), which deals with regulations for those living on the island, and by the use of Ajax as one of the ten eponymous heroes chosen by Cleisthenes in 508 BC for the Athenian tribes. Ajax was the only non-Athenian in the group.

In 480 a critical naval battle in the Persian Wars was fought in the straits between Salamis and Athens. The smaller, swifter ships of the Athenians outmanoeuvred the large Persian ships, and the Athenians and their allies defeated a larger power. This battle became a legend in Athenian history, and a topos in Athenian literature. Thus later writers who refer to Salamis often do so with reference to this battle. The island itself served as a refuge for women and children during the Persian invasion of Athens.

At least two major figures in the 5th century had connections with Salamis. Towards the end of the Peloponnesian War democratic sympathizers took refuge on the island, and they were pursued there by the Thirty Tyrants. An incident involving one such individual, a certain Leon, is mentioned by Socrates in the *Apology*. Socrates was meant to retrieve Leon from Salamis, but he refused to do so. Also there was a tradition that the playwright Euripides was born on the island, and that he used to write his plays there in a cave overlooking the sea.

Mention must be made of two groups of people who lived on the mainland of Attica and called themselves Salaminioi, i.e. men from Salamis. These men from Salamis were dubbed the Salaminioi of the Heptaphylai, and the Salaminioi from Sunium. It is unclear when, where, and why they had their origins, and furthermore we have little idea of their purpose. They are known through fragmentary inscriptions, and study of those is still ongoing. They were apparently a kinship group with a civic function.

Aristotle tells us that Salamis had its own archon, although no remains of any inscriptions concerning archons on the island have been identified. It is also known (from the *Athenaion Politeia*) that Salamis had its own dramatic festival, but no remains of the ancient theatre have been found.

The island changed hands in the late 4th century, when Demetrius was in control at Athens, but there is little other solid information about the status of the island in the literature of the Hellenistic period. It is known through inscriptional evidence that the Ephebes, Athenian (and later, wealthy Roman) young men in military training, performed some of their activities on and around the island. Numerous honorific inscriptions attest to their good behaviour while on the island.

Roman pottery is visible at many sites on the island and it is thus clear that Salamis remained active in the waning years of the pre-Christian era, and the subsequent centuries of the empire. Chapels from the Byzantine period, as well as the occasional mention of the island in literature, are evidence that Salamis was inhabited in the medieval period. Turkish and Albanian place names on the island attest to the presence of those peoples, and much later, during the War of Independence, Salamis served as a base of operations in Attica. It was from Salamis that George Karaiskakis set out on the mission to take the Acropolis. Karaiskakis lost his life just as the battle was beginning. In May 1997 a monument was erected on the island in Salamis town to commemorate this event.

Summary

The northernmost of the islands in the Saronic gulf, Salamis has been inhabited since the Neolithic period. There are mythological as well as historical connections with Athens. An important battle was fought in 480 BC in the straits between Salamis and Athens in which the Persian fleet was defeated. Salamis was a base of operations in the War of Independence in the 1820s.

Samos

Island in the east Aegean

Samos is one of the larger of the Aegean islands, with an area of 492 sq km, and it lies closest of all of them to the coast of Asia Minor: the channel dividing it from Turkey is today only 3 km wide, and in prehistoric times it was joined to the mainland. In antiquity it was known as both Parthenia and Anthemus, but as Samos from at least the 5th century BC. Pausanias (10. 12) claimed that the island had an early distinction as the home of one of the first of the Sybils. It is quite mountainous, well watered, and heavily wooded, and has always been known principally for the fertility of its land; the island still exports olive oil and tobacco. While for later centuries the fineness of Samian muscat wine was much famed, and was later to be extolled by Byron, it was not always thus. Strabo (*Geography*, 14) emphasized the poor quality of the island's wine compared with other islands in the region, but praised its other products, and quoted Menander as saying that "it even produces birds' milk".

Throughout the pre-Christian period from the 3rd millennium BC the island was populated, but it was only in the 6th century BC that Samos knew real fame and power, when the tyrant Polycrates established himself as sole ruler. He built up a powerful fleet, annexed other islands, and established a famous court that attracted artists of all kinds. A tunnel more than 900 m long that was completed in 524 BC under the direction of Eupalinus of Megara, ensuring a water supply to the city of ancient Samos in time of siege, remains to this day a unique monument to another aspect of his reign. To Polycrates is also attributed the construction of a man-made harbour and breakwater. The success with which the Samians resisted a siege by the Lacedaemonians for 40 days (Herodotus, 3. 56) during the reign of Polycrates, when they were unable to bring about the city's subjection, was no doubt due in part to this tunnel. The tyrant's eventual death at the hands of Oroetes is described by Herodotus (3. 125): "He slew him in a way too horrible to describe, and then crucified him."

At least one and a half millennia of the history of Samos can be traced in the extensive coastal site of the sanctuary of Hera, known as the Heraion. Its earliest remains date from the Bronze Age, but its most impressive feature, which was known all over the Hellenic world, was the great temple built during the 6th century BC; its size (it was almost 100 m in length) caused Herodotus to state that it was the largest of all the temples he had seen. "Its first architect was Rhoecus, the son of Phileas, who was a Samian" (3. 60). Burnt down in the later 6th century BC, it was rebuilt, with numerous other structures added at various dates, before an early Christian basilica was built at its east end during the 5th century AD; a cistern here was in use into the 6th century AD. Pausanias also credited the same Rhoecus with being one of the first Greeks to make images by casting molten bronze (8. 14). Another 6th-century BC artist of great fame was Theodorus of Samos, who was a sculptor and architect, and made a magnificent ring of gold and emeralds for the tyrant Polycrates. He was credited by Pliny (*Naturalis Historia*, 34. 83) with creating the first self-portrait to be made in bronze.

Further evidence of the vigorous developing life of Samos in late antiquity and the early Christian centuries is provided by several excavations, such as that at Pithagorio, where an early Christian basilica was built on the site of a Roman villa; at Panagitsa another basilica and baptistery were built over Roman baths. Churches were built in various parts of the island between the 4th and 6th centuries, showing that a vigorous island life persisted until Arab raids began in the 7th century, but this must have continued because a bishop of Samos attended the important Church council of 787 in Nicaea at which iconoclast edicts were revoked. The island's position continued to dominate its history, since it was chosen as the base from which Nikephoros Phokas would reconquer Crete in 960.

In the 10th century Samos was the only Aegean island to be named as the centre of a theme, when it became a subdivision of the theme of the Aigaios Pelagos; this importance was probably due to its geographical location close to the mainland, and it was governed from Smyrna. The island's prosperity continued into at least the early 12th century, when a Russian traveller, the *higumen* (abbot) Daniil, wrote admiringly of his visit here, noting that "the sea abounds with fish, and the island is very fertile."

In the Deed of Partition of 1204 Samos was listed as being allocated to the new Latin emperor, but he never occupied it and from *c.*1225 it was taken into the empire of the Byzantine government in exile in Nicaea. In the 14th century, with weakening Byzantine power, the island suffered Turkish raids, and then was occupied briefly by the Genoese in 1304 and again in 1346 for some 30 years. Samos, like so many other islands, began to suffer from the incessant plague of piracy, and after a little more than a century of Western government the population was moved to the more secure Genoese island of Chios. The proximity of Samos to the mainland meant that it was thereafter one of the earliest islands to come under direct Turkish rule, probably during the 1470s.

Samians became known during the early history of the Greek War of Independence for their bravery and dedication, and Samiots joined the revolution in 1821 at the earliest possible moment, taking up arms in April of that year and murdering the entire local Turkish population. Samos contributed more than any of the other smaller Aegean islands to the cause of independence, and was given exceptional status at several stages in the development of the Hellenic state during the 19th century. A substantial castle, known as the Kastro tis Logothitis, was built in 1824 and it still occupies the hill to the west of Pithagorio; no other island is able to demonstrate the assertion of its independence at such an early date with a building of this kind. At the London Conference of 1829–30 it was proposed that Samos, with Crete, should be excluded from the geographical division of the rest of Greece, but the island was granted special privileges, and from 1834 to 1859 was governed by a Greek ruler, Stephanos Bogaridas. This autonomous status only came to an end in 1913 when, in the distribution of territories after the Balkan wars, Samos came under fully greek rule; from that point it received the same treatment and status as any other Aegean islands that were not then still under Turkish or (from 1912 in the case of the Dodecanese) Italian, rule.

Summary

The closest of all Greek islands to the Turkish mainland, Samos first claims attention in the 6th century BC when it was ruled by the tyrant Polycrates. Monuments of this date include a tunnel (900 m long) ensuring the supply of water to the city of Samos, and the temple of Hera. Samos was very active in the War of Independence in the 1820s.

Samothrace

Island in the northern Aegean

Samothrace lies in the northern Aegean, at a point approximately equidistant from Thasos, Alexandroupolis, and the Gallipoli peninsula. It covers an area of 176 sq km and is well watered and quite fertile, although it has a ruggedly mountainous interior. It was from the "topmost peak of wooded Samothrace" that Poseidon was said by Homer to have watched the fighting on the plains of Troy (*Iliad*, 13. 12). Pausanias (7. 4) records that it was first called Dardania, a name perpetuated in the important sea channel nearby of the Dardanelles. Samothrace has been populated from earliest times, but controversy surrounds the place of origin of its inhabitants. It was peopled initially by Thracians from the nearest part of the mainland of what is now northern Greece. In the Classical period colonists were said to have come to the island from Samos in the 8th century BC, hence its name. However, archaeological evidence tends to support Lesbos or the Troad as the source of these new settlers, though the Thracian dialect continued to be used until the end of the pre-Christian era.

The outstanding importance and fame of Samothrace in the Hellenic world was due to its being the focus of a cult, which caused the island to become the foremost religious centre in the northern Aegean from the 6th to the 1st century BC. The sanctuary of the Great Gods, excavation of which has continued for over a century, reveals that a complex process of initiation rites took place there. The mysteries that were enacted here are referred to by Plato and Aristophanes, and it is known that the historian Herodotus (among many others) underwent them. The physical remains of the sanctuary are immensely impressive; the rotunda, dedicated to the Great Gods by queen Arsinoe in the late 3rd century BC, is the largest circular structure known to have been built by Greek architects. The world-famous statue of the Winged Victory, also known as the Nike of Samothrace and now in the Louvre, was found here in 1863. With the statue of Venus found on Melos it perhaps shares the distinction of representing the essence of the Hellenic artistic spirit of its age.

The prosperity of the island must have continued into the early medieval period, as an inscription records the restoration of baths here by the emperor Justinian; it formed part of the eparchy of Thrace in the 10th century. After 1204 it was awarded to the Latin emperor, and as its location was not as favourable as that of Lemnos, it was retained by his successors until 1261. Subsequently it was the Genoese dukedoms of the northern Aegean that were to leave the most substantial remains on Samothrace after the sanctuary of the Great Gods.

The Gattilusi dynasty, from Genoa, became more closely integrated into Greek life than almost any other of the Italian families that settled in the Aegean, and so have a place in the Hellenization of western European culture. The *kastro* (castle) that Palamede Gattilusi built in the 1430s at the Chora on Samothrace carries an inscription in Greek that states that "the fortress will strike fear into his enemies". The family was proud of having married into the Palaiologos dynasty in 1355, and the monogram of the imperial family figures on this inscription. When the antiquarian Cyriacus of Ancona visited the *kastro* in 1444, he called it "the new inland town". He also visited the towers that Palamede Gattilusi had built near to the sanctuary of the Great Gods, and mentioned the Classical inscriptions in both Latin and Greek that the Genoese lord had assembled in his tower, where "he loved greatly to hear learned discussions".

The victorious sultan Mehmet II dispossessed Palamede Gattilusi in 1456, but in the same year the island (with Lemnos and Thasos) was annexed by an Italian cardinal, Ludovico Trevisan, who had been sent as part of a crusade against the Turks by pope Callixtus III. For three years the banner of St Peter was flown from the *kastro* until Mehmet II retook the island, and it was to remain in Turkish hands (except for a brief Venetian hiatus of 1466–79) until 1912. Only then was the island able to resume its full place in the Hellenic island tradition.

Summary

An island in the northern Aegean, Samothrace was traditionally colonized from Samos, though this is not supported by archaeology. The island's fame rests on the mystery cult of the Great Gods (Cabiri), the remains of whose sanctuary survive. The *kastro* (fortress) built by the Genoese duke Palamede Gattilusi dates from the 1430s.

Sanctuaries

In the context of Classical Greece a "sanctuary" is best defined as a sacred space, formally bounded and set aside for ritual activity. In historical times at least, such centres usually provided sanctuary in the sense of asylum for refugees from human or divine persecution.

Most of the important sanctuaries of Classical Greece were founded or underwent major development from the 8th century BC. The traditional date of 776 BC for the foundation of the Olympic Games is a good benchmark. The evidence is at first provided chiefly by sacrificial debris and small-scale votive offerings (among which pottery and terracotta and bronze figurines are prominent) at sites such as the sanctuary of Zeus at Olympia. Modest temples were sometimes built, but the most prominent structural and ritual component of the sanctuary was always the altar where sacrifical victims were burned.

Although ritual activity in sanctuaries was standardized to a degree (public and private sacrifice, votive offerings, some components of festivals), there were numerous local variations corresponding to the character of the individual cults.

Greek sanctuaries developed an increasingly monumental character after 700 BC, with first temples, then other buildings, constructed of ashlar masonry. These tended to accumulate slowly and haphazardly (e.g. at Olympia) in and around the sacred area. Only in the Hellenistic period did formal regular planning become the norm and then it could be effectively applied only to new or previously undeveloped sites (e.g. the Asclepieum on Cos).

The architectural character of sanctuaries, such as that of Apollo at Delphi in the late-Classical and Hellenistic periods, when structural development was most intense, provides the clearest indication of the major aspects of the festivals – athletic competitions (stadia, gymnasia, baths, offerings of victors), theatrical events (theatres, offerings). Their administration and the importance of the major sanctuaries (especially the Panhellenic centres of Olympia, Delphi, Isthmia, and Nemea) as international meeting places are indicated by other elements, such as *bouleuteria* (council chambers) and treasuries, as well as significant sculptural and architectural dedications, which often had a propaganda intent. Some of these functions are likely to go back to the period of expansion of the sanctuaries in the 8th century BC, although (unless the large bronze tripods from Olympia are athletic prizes, as is sometimes thought) there is little direct evidence, since most of them can be carried on without the need for any formal structures (races can be run on open ground: a stadium is a luxury).

In the Roman period the use of the Greek sanctuaries continued uninterrupted, although new buildings (the bath houses are particularly common and striking) were regularly added in the new and distinctive building style of concrete and brick. The appearance of temples to house the imperial cult (there was a temple to Rome and Augustus on the Athenian Acropolis) is another distinctive feature.

As Christianity gradually took hold of the Roman world, especially after its adoption in AD 313 by the emperor Constantine, the pagan sanctuaries went into decline, although they continued to be patronized at least until closed by edict of Justinian in AD 529.

The fact that many ancient sanctuaries have later Christian churches within their boundaries (at Olympia the workshop of Phidias was converted into a church in the 5th century AD), and particularly that some of these (the basilica at the sanctuary of Asclepius, Epidaurus, *c.*AD 400) seem to have been built before the pagan complex became defunct, shows that sometimes paganism and Christianity intermingled and that the places retained their sacred character, even when the formal nature of the religion changed. Some later monasteries (e.g. at Daphni, on the outskirts of Athens) are even built on the sites of ancient sanctuaries, and the modern buildings incorporate material from the ancient.

While the sanctuary in the sense defined at the beginning of this entry seems essentially a creation of the Geometric period and to have died with the banning of pagan religion, various similarities of form and function can be identified at sites of both earlier and later periods. In Greece some prehistoric sites have been designated sanctuaries, with varying degrees of probability and correspondence to the above definition. Although the Neolithic period is a blank, in the Early Bronze Age the Cycladic island of Keros has sometimes been thought a sanctuary on the grounds of unusually rich discoveries of marble artefacts, but this is disputed. More plausible is the rustic shrine at Korfi t'Aroniou on Naxos, which was uniquely adorned by decorated stone blocks.

In Minoan Crete the most convincing candidates are the peak sanctuaries, remote hilltop sites with clear evidence of exclusively ritual activity (sacrifice, votive offerings). The Middle Minoan complex at Anemopsilia, near Archanes, is perhaps a temple rather than a sanctuary, but its ritual use is undoubted. Sacred groves are sometimes identified in scenes in art (seal stones, the "sacred grove" fresco from Knossos). Some houses (especially Xeste 3) at Akrotiri on the Cycladic island of Thera have extensive and clearly ritual painted scenes but their assignation as sanctuaries is difficult, since the focus again seems to be on the individual building rather than a sanctuary area; the same is true of other ritual structures, such as the "temple" on the island of Kea, the Mycenaean-type "sanctuary" at Phylakopi on Melos, the "cult centre" at Mycenae itself (a stronger candidate), or the shrine area at Mycenaean Tiryns.

It is impossible to say how far the elaborate festivals, often involving athletic and dramatic competitions, so characteristic of Classical sanctuaries, may have existed in prehistoric times, but there is so far no evidence for the sort of installations that later became the norm. One could however appeal to the funeral games mentioned in Homer or the scenes of chariots on Mycenaean gravestones and vases as hints of similar activities in earlier times.

While a few important later sanctuaries (Hera on Samos, Apollo Maleatas at Epidaurus, etc.) have produced virtually certain evidence of continuous use from prehistoric times into Classical antiquity, the extent to which this reflects continuity of religious belief and practice in detail is obscure. As well as these possible prehistoric predecessors, the continued use of parts of some sanctuary sites after AD 529 has already been mentioned. Several aspects of ancient practice associated with sanctuaries find echoes even up to the present day, although the degree of genuine continuity is hard to assess, partly because people look for similar relationships with their gods,

whether Christian or pagan, and may approach them with similar rituals.

Votive plaques seem to have lasted from antiquity, through Byzantine times, to the present day. Representations of diseased limbs etc., similar to those that used to be offered to Asclepius, can still be seen in Orthodox churches.

The annual patronal festival of each Orthodox church takes on a festive character that involves the sharing of a meal. In several parts of Greece animals are slaughtered on the spot. One example of this is on Imbros (now under Turkish control), where the festival of the Dormition on 15 August is accompanied by the blessing and slaughtering of animals, and the cooking and consumption of the meat. Patronal festivals are still occasions for reunion of émigré locals from all over the world and, as in antiquity, larger festivals are used as occasions for secular activities (fairs etc.). They may also be the occasion for political pronouncements. In Cyprus, up until quite recent times, cattle markets took place at some festivals.

Occasionally too contemporary religious festivals are accompanied by competitive events, such as that at Hagios Soulas on Rhodes, described by Lawrence Durrell in *Reflections on a Marine Venus* (1953), where the saint is honoured *inter alia* with athletic contests and horse and donkey races. On Lesbos, at Hagia Paraskevi, the festival of Hagios Charalambos includes the slaughter of bulls and an equestrian parade and races.

Santorini

Island in the Cyclades

This form of the island's name is Frankish, from Santa Irini, one of the local churches. In antiquity, as often nowadays, it was called Thera, also at times Kalliste and Strongyle. At the southeast of the Cycladic group, it is geologically the most remarkable of the Cyclades, since it contains an active volcano.

Although there have been numerous recorded volcanic episodes over the last 4000 years, sometimes severe, the most violent concluded with the explosion and collapse of the crater in a massive catastrophe during the Bronze Age (*c.*1500 BC, or 1628 BC if recent scientific analyses are correctly interpreted). During the eruption phases at that time the volcano disgorged pumice and tephra (volcanic ash). The latter covered the island with a layer up to 50 m thick. This extraordinary event is thought by some to have been the source of the myth reported by Plato of the submerged city of Atlantis. Research has shown that tephra was also deposited in substantial quantities on Crete, Rhodes, and the mainland of Asia Minor, with potentially serious consequences for the agriculture of those areas. The massive tidal wave which followed the collapse of the crater almost certainly inflicted heavy damage on coastal sites in the southern Aegean. The psychological consequences of this catastrophe cannot now be accurately assessed but were surely profound, and must have played a part in the transfer of political and cultural authority in the Aegean from Minoan Crete to the Mycenaeans of mainland Greece, by weakening the former.

At the time of the eruption the material culture of Thera was spectacular. Archaeological work near Akrotiri since 1967 has uncovered a town with many buildings in fine ashlar masonry and richly decorated with frescos. If the unusually good state of preservation has not led to an overestimation of the significance of Late Bronze Age Thera, it may well have been a centre of architecture and the arts whose influence spread throughout the Aegean. Even if, as seems more probable, the artistic and technical achievements of the Therans were learnt from the Cretan palaces, it was nonetheless probably a centre of Cretan authority in the Aegean and must have acted as a conduit through which ideas and techniques were exchanged.

In later mythology Thera got its name from Theras, who supposedly came there with a group of settlers from Sparta. This would explain the Dorian character of the island. Thera seems to have had significant settlement from the Geometric period and produced locally distinctive Geometric and Orientalizing pottery. The earliest remains of the ancient town, on an impressive but remote site high on Mesa Vouno, belong to the Archaic period. The nearby cemetery (Sellada) has produced finds from the Geometric period onwards, including three archaic *kouroi* (nude statues of standing young men). Therans founded the colony of Cyrene in 631 BC, according to Herodotus because their homeland was devastated by a long

drought. The place flourished particularly in Hellenistic times, to which many of its surviving remains belong and when it was a forward naval station under the Ptolemies. It does not seem to have been particularly important in the Roman or Byzantine periods, although there are remains of both, including the painted church of the Panagia Episkopi, reputedly founded by the emperor Alexios I Komnenos (1081–1118).

From 1207 (apart from a brief interlude in 1269 when it was retaken by the Byzantines), it was in the hands of various Frankish families – the Sanudi, the Barotsi, the Crispi, etc. In the 15th century the island's prosperity was curtailed by pirate raids and it became impoverished and depopulated. Several hundred families fled to Crete. In 1537 it was captured by Barbarossa and became part of the Ottoman empire, though without much direct interference. In 1821 the Greek flag was raised.

ROBIN L.N. BARBER

Summary

Santorini (or Thera) was a flourishing centre of prehistoric civilization of which remarkable artistic remains survive. The volcanic eruption of the island which brought that to an end may be the source of the legend of Atlantis. In early antiquity the island was prosperous and took part in the colonizing movement. In the medieval and later periods its history was similar to that of the other Cyclades.

Sappho

Poet of the 7th–6th centuries BC

Born probably at Eressos on Lesbos around 630 BC, Sappho was a contemporary of Alcaeus and of Pittacus, the tyrant of Lesbos. Her family may have been involved in the same upheavals among aristocratic factions that feature prominently in Alcaeus, since sometime before 595–594 BC she is said to have been exiled to Syracuse, where there was a statue of her down to the 1st century BC. She seems otherwise to have spent most of her life in Mytilene.

The remains of Sappho's poetry consist of one whole poem (poem 1), preserved by Dionysius of Halicarnassus as an example of the "smooth and exuberant" style, in which she invokes Aphrodite to assist her in love; about ten substantial fragments, including five stanzas (poem 31) preserved by "Longinus", describing the physical symptoms of love; 100 short citations from ancient writers; and around 50 papyrus fragments. The poems are written in the Aeolic dialect native to Lesbos. Unlike that of Alcaeus, Sappho's extant poetry barely mentions contemporary politics, and her focus of interest instead is on individual emotion, and the traditional female concerns of love, marriage, and beauty. This focus accords with the general tendency of the early lyric poets to reject the Homeric role of poet as impersonal narrator. No more than the other lyricists, however, did Sappho ignore Homer, and some of her poetry seems to recast Homeric themes from a female perspective.

Her poetry indicates intense romantic and probable sexual involvement with some of the young women of whom she writes. The exact nature of these relationships must remain uncertain because our evidence is so fragmentary: possibly as early as Anacreon, but certainly by the time of Ovid's *Heroides*, the affairs were assumed to be sexual. Female same-sex love is rarely mentioned, though not unattested, in early Greece, and may have become tahoo later on, but one may assume that such relationships and sentiments were acceptable in the Lesbos of Sappho's time. A relatively large number of her poems concern young girls, marriage, or farewells. It is therefore sometimes suggested that her poetry reflects a social structure in which young girls came to Sappho prior to marriage for some kind of education in music and other arts, and romantic or sexual involvement was part of the educative process. If so, one may compare the better-attested educational relationships between men and boys in the ancient world. Sappho's passionate descriptions of female beauty may be intended to inspire male desire for the girls in marriage – the destination of all Greek girls – as much as it expresses any personal feelings of Sappho herself. Some of the content of Alcman's *Partheneia* may be comparable.

Lesbos was home to an unusually large number of early poets – Terpander and Arion as well as Alcaeus and Sappho. It was also known for the beauty of its women, and as both a gifted poet and a celebrator of female beauty Sappho may be regarded as typical of her island. In later tradition she is regarded as anomalous precisely because of these two features. Although she was not the only female poet in the ancient world, she seems to have outshone others to such a degree that Galen states that "the poet" is Homer, and "the poetess" Sappho. Again, the intense passion of the poems has had a clear effect on her later reputation: one may guess that such passion was unusual, at least from a woman. One late tradition divides Sappho into two people – one a remarkable lyric poet, the other a sex-crazed courtesan. Down to Roman times, emphasis is less on the female objects of her passion than the passion itself, with the result that in Greek comic traditions she is portrayed as heterosexually voracious. Popular tradition recounts that she fell in love with a fisherman called Phaon and threw herself off the Leucadian rock when her passion was

unrequited. The story probably derives from mistaken extrapolation from her verse: it appears on vases of the late 5th century BC, and was popular among comic poets from the 4th century BC. Roman attitudes to sexuality focused more on the female objects of her passions, and the concerns of the late 20th century have made Sappho's perceived lesbian sexuality nearly as important as her poetry.

Ancient sources unanimously praise her brilliance. She is a subject of vase painting from the late 6th century BC. She found favour with Solon and Plato's Socrates, and she is the subject of treatises from at least the 4th century BC. The Alexandrian scholars included her in the canon of the ten lyric poets, arranging her songs in nine books, according to metre. Theocritus, Callimachus, Apollonius, Moschus, and Bion all show her influence. Epigrams honour her: Dioscorides in the late 3rd century BC calls her the tenth Muse, and this honorific title becomes conventional for her thereafter. Her fame in her native island was such that coins from Mytilene of the 1st to 3rd centuries AD bear her portrait.

Sappho's poetic reputation has survived on progressively slimmer evidence, since she suffered the fate of all those writers whose subject matter or dialect did not suit the educational requirements of the later ancient world. Her difficult dialect rendered her writing unsuitable for inclusion in a canon that increasingly favoured Attic Greek: the lyric poets are notoriously under-represented in the body of texts that came to form the educational canon. Moreover, her passionate subject matter, like that of many other lyricists, did not suit the prevailing preference for texts suitable for the classroom.

As the canon came to dominate textual production, fewer and fewer noncanonical texts were copied, especially in the 2nd–4th centuries AD when the transition from the book roll to the codex took place. Even so, some of Sappho's poems did make that transition, and in the 2nd century AD the poems seem to have been popular as after-dinner entertainment. Most surviving papyrus fragments of her poetry may be dated to the 2nd and 3rd centuries AD. Gradually, however, Sappho came to be quoted in short citations more for grammatical or metrical peculiarities than for literary reasons, although writers down to the 6th century AD quote her and show some familiarity with her works. A parchment from Egypt shows that she still had an audience even in the 7th century AD.

After this the trail starts to go cold. This is more likely to be due to a general decline in circulation of all but the most standard authors than to Christian distaste for her subject matter. It is sometimes asserted that her books were burned, for example by Gregory VII in 1073, but the evidence for this is far from conclusive. Although the 9th-century lexicographer Photios cites her, the *Etymologicum Magnum* of *c.*1000 mentions her only five times and later encyclopaedias after the *Suda* ignore her. Byzantines of the 12th century and later mention her, but it is impossible to determine whether their knowledge derives directly from texts or from reference works. Tzetzes even claims that her work had disappeared by his time, although this may be an exaggeration. Certainly after the sack of Constantinople in 1453 rare texts such as hers are unlikely to have survived. In 1546 Robert Estienne published the first edition of Dionysius of Halicarnassus, which contains Sappho's only complete surviving poem, and in 1554 there followed the edition of "Longinus".

Very little of her poetry survives but it was much admired in antiquity. Her passionate subject matter may not have endeared her to the Byzantines.

Sarakatsans

Nomadic people of northern and central Greece

Up until 30 years ago it was possible to find in Greece a shy breed of nomads living in straw huts, known as Sarakatsans. In Bulgaria similar nomads, also speaking Greek, were called Karakatchans, but their way of life had been regulated, although not abolished, by communist bureaucracy. There were over 4500 Karakatchans in the 1965 census, and this number is almost certainly an underestimate. In the 1980s the Karakatchans seemed to be doing rather well in Bulgaria, the authorities having decided that collective farming in winter and summer pasturage was best left in their hands, but the

collapse of communism has led to much emigration to Greece. In Greece the forces of capitalism and bureaucracy have led to collapse in the Sarakatsan way of life. Sometimes wandering families of Sarakatsans were settled in Greek villages, causing a certain amount of resentment from the villagers, some of whom as semi-nomadic transhumants like the Vlachs felt that they had a better claim to the land being settled. Alternatively the Sarakatsans, used to travelling long distances, made with other emigrants from the Balkans the pilgrimage to Germany in search of employment as *Gastarbeiter*. Here they rapidly lost their distinctive identity and gave up their way of life, so different from that practised in western Europe. Sarakatsans used to be found in the mountain ranges of Macedonia, Epirus, Thessaly, and even Boeotia and Attica. In Bulgaria they roamed the Rhodopes and the Haemus mountains. Now one can occasionally find them in mountain villages, frequently confused with the Vlachs. Because of their nomadic habits it is hard to tie them down to one place, and their lack of regional identity is a further factor which will probably lead to their disappearance.

If the future of the Sarakatsans seems dim, their past is yet more obscure. Scholars are divided as to whether they are Hellenized Vlachs or pure Greeks. The former theory rests on certain common habits like transhumance with a biannual journey beginning on St George's Day (23 April) and ending on St Demetrius' Day (26 October), and certain common words like *tselnik*, the leader of a tribe, and *kalivi*, a hut. On the other hand, Vlachs, though confused with Sarakatsans, are contemptuous of them. Customs in such matters as marriage ceremonies and the construction of huts are different in the two groups. Most scholarly opinion holds that the Sarakatsans are purely Greek, indeed more purely so than the average Greek. An occasional straight nose, reminiscent of a Minoan fresco, seen on a Sarakatsan, and the geometric pattern of their costume lend support to the theory, well argued by Hoeg and Hadjimichalis, that the Sarakatsans are an ancient Dorian tribe who somehow never became incorporated in the life of ancient and medieval Greece. Leigh Fermor, who travelled among the Sarakatsans of western Thrace, put a romantic gloss on this theory, imagining a people who somehow managed to escape from history, bypassing the Persian invasion, the empire of Alexander the Great, the Roman conquest, the Slav invasions, and even the fall of Constantinople in the same way that their modern descendants by being constantly on the move have managed to bypass the apparatus of the modern state.

Such a theory, as Kavadias has pointed out, flies in the face of linguistic and historical evidence. There is no mention in ancient or medieval sources of a fully nomadic Greek tribe like the Sarakatsans, although there are references to non-Greek nomads, such as the Scythians, and of transhumance as practised by shepherds in *Oedipus Rex* and by the medieval Vlachs. Nor does the language spoken by the Sarakatsans, although it

contains several archaic features, show like Tsakonian any resemblance to the pre-koine dialect. It seems more likely that the Sarakatsans were Greeks settled in the Byzantine empire who, when this empire collapsed in the 13th century, took to a wandering life in the mountains in order to preserve their Greekness and their ancient customs.

It is in their customs rather than their language that the Sarakatsans show their ancient roots. Many of their rituals display a strange syncretism between Christianity and perhaps pre-Classical paganism. Campbell establishes well the Sarakatsan subordination of women to men, combined with a protective reverence to the female sex. In Sarakatsan marches the place of honour at the rear of the column is taken by the last woman to be married; the Vlachs give this post to an old man. Any offence against female chastity is severely punished, particularly if it is the woman who is the sinner. As with so many minority groups, the moral values that kept Sarakatsans together as a close-knit community receive scant respect in the modern world.

Summary

A nomadic Greek-speaking people, the Sarakatsans used to inhabit the mountainous areas of Macedonia, Epirus, Thessaly, Boeotia, and Attica. In Bulgaria they were known as Karakatchans. Their origins are obscure and the subject of debate. In recent decades they have mostly lost their identity.

Sassanians

Persian dynasty

The name Sassanians, given to the royal dynasty which ruled the third Persian empire from AD 224 to 651, derives from Sasan, possibly the grandfather of the first Sassanian king, Ardashir I (224–39/40) (Tabari I. 814). Ardashir's family ruled as local dynasts of the Parthian empire in Istakhr, near Persepolis, but he extended his power to Elymais and Kerman, forcing the submission of local kings and vassals. On 28 April 224 Ardashir defeated the Parthian king Artabanus IV in a battle on the plain of Hormazdjan in Media and, after the capture of the Parthian capital Ctesiphon, celebrated his official enthronement there as "king of kings". At its utmost extent the empire of the Sassanians stretched from Syria to India, and from the Caucasus to the Persian Gulf, but borders changed frequently in its 427-year existence. Middle Persian was the principal language of the Sassanians, though Parthian, Greek, Aramaic, and Bactrian, among others, were also used.

Throughout Sassanian rule the Persian empire was faced with two principal enemies, the Romans in the west, and invading tribes from the north and northeast. Though written Greek and Roman sources focus predominantly on the Persian–Roman aggressions, the constant threats to the Sassanian empire from nomadic peoples were equally serious and have to be taken into account. Relations between Rome and Persia were characterized by their respective ideologies. As with their attitude towards the Parthians, the Romans saw their fight against Persia in the ideological light of the Graeco-Persian wars of 490 BC and 480/79 BC and Alexander's conquest of Persia in 331 BC. Alexander Severus, like Caracalla, regarded himself as a "second Alexander" (Dio, 79. 17. 3) while Gordian III celebrated a festival in honour of Athena Promachos for the Athenians at Marathon prior to his eastern campaign. The Sassanians, though they lacked any direct knowledge of the first Persian dynasty, laid claims to the heritage of the Achaemenids. Politically this was manifested in the use of Achaemenid sites in Fars, and militarily in their claim to Achaemenid domains, which in particular meant the region west of the Euphrates river. This was the prime motivation for their western campaigns, though the reconquest of this region was never achieved.

Hostilities against Rome began with raids into Syrian territory in AD 230, and escalated under Shapur I (239/40–70/72), who claimed victories over Gordian III (244), Philip the Arab (244), and Valerian (260). Roman–Persian aggression continued under Shapur's successors, and Ctesiphon was briefly taken by the Romans (283). Between 337 and 363 the Persians under Shapur II (309–79) fought intermittently against the Romans, but a peace settlement agreed under Shapur III (383–88) led, with one brief exception in 421–22, to a long period of peace, which lasted until the beginning of the 6th century. Shapur II undertook a campaign against the Arabs, and settled Arab tribes in Iraq as protection against the desert Arabs and those Arab tribes who supported Rome. The threat of invading nomads became reality in 395 when Huns invaded Armenia and even reached Syria and Cappadocia.

After a period marked by seven years of famine during the reign of Peroz (459–84), by Sassanian defeat by the Hephtalites (White Huns), and by inner revolt, a phase of revival began with Chosroes I (531–79). Though his reign also saw Persia at war with Byzantium, Chosroes I reached several peace settlements with Justinian I in 545, 551, and 561. The 6th century was a period of close cultural exchange between Persia, China, and Byzantium. The three thrones, which stood beneath the throne of Chosroes I in Ctesiphon, ready to receive the emperors of Rome and China and the great khan of Central Asia as his subjects, are perhaps the best demonstration of the fact that the Sassanians were well aware of their central position between the eastern and western empires. Cultural exchange between the Far East and the Mediterranean was transmitted through merchants and traders as well as the Syriac-speaking Christians of Mesopotamia. Through them Byzantine medicine and philosophy became known in Ctesiphon, while in 527 Nestorian Christian scholars from Nisibis were received in Constantinople. In 638 Nestorians explained their religious

beliefs to the emperor of China, while Indian science and knowledge found their way into the west via Ctesiphon.

Chrosroes I defeated the Hephtalites in 568, an achievement which he commemorated on specially minted coins. Chosroes II (590–628) undertook major campaigns, invading Byzantium (603), taking Antioch and Jerusalem (614), and Egypt (619), but he was met with an equally strong opponent, Herakleios (610–41), who marched against the Sassanian king in 622. The fall of the Sassanian empire, however, was brought about by a third power, which both Byzantium and Persia had neglected with grave consequences—the Arabs, who invaded Persia and the Roman Near East in the mid-7th century.

The cities of Ctesiphon, Firuzabad, and Bishapur were the main seats of Sassanian power. At its centre was the king, who ruled as a god-king (*bay*) with the divine sanction of Ahura Mazda (*yazd*), together with his queen, whose public role is well documented on rock reliefs and on coins. The king was the guardian of the Zoroastrian religion, though other religions—Judaism, Christianity, and Manichaeism—were, depending on the respective king, tolerated. The aristocracy consisted of four groups, the local dynasts (*shahrdar*), the princes (*vaspuhragan*), the heads of the noble houses (*vuzurgan*), and the Persian nobility (*azadan*). These were followed by a middle class of merchants, craftsmen, and traders, as well as peasants and slaves, about all of whom very little is known. In the 4th century high offices emerged in religion and politics: the head of the high priests (*mobad*), the great priest (reconstructed term: *vuzurg mobad*), and the priests themselves (*mobads*), and in the political sphere the head of the farmers (*vastaryoshan salar*) and the head of the army (*arteshtaran salar*).

Frequent military aggression between the Romans and the Sassanians undoubtedly led to reciprocal influence in weaponry and military tactics. Under Chosroes I Sassanian fortifications seemed to follow the prototype of the Roman *limes*, while it is thought that equipment of the heavily armoured Sassanian cavalry, the cataphract, which had been developed in their wars against the nomads, was adopted by the Roman army (*clibanarii*; Ammianus Marcelinus, 16. 10. 8). The claim that a mutual influence existed in the respective administration and fiscal policy of the Sassanian and Roman empires has yet to be convincingly demonstrated, but in art and architecture reciprocal inspiration is well attested. Sassanian artistic elements can be traced in Byzantine decorative motifs, and it is thought that the Persian dome-structured buildings provided the prototype for Byzantine architecture. The find of a silver jug with Classical figures in China, and a silver gilt *rhyton* (drinking horn) from Tibet decorated in a Classical/Sassanian style, are evidence that Persia was the transmitting power of western and Sassanian culture.

Summary

The Sassanians were the royal dynasty which ruled the Persian empire from AD 224 to 651. Hostilities with Rome were frequent for the first 150 years. Revival came with the reign of Chosroes I (531–79). In the 6th century there was close interchange between Persia, China, and Byzantium. The Sassanians were defeated by Herakleios in 622. Their empire fell to the Arabs in the mid-7th century.

Satyr Play

The satyr play was a type of Classical Greek drama that stood midway between tragedy and comedy. Satyr plays were composed by tragedians and performed with tragedies at dramatic festivals in Athens; the rules of these contests required that each tragedian present three tragedies followed by a satyr play. Satyr plays also resembled tragedies in being concerned with mythological subjects for the most part, rather than with contemporary ones, as were comedies. Like comedies, however, satyr plays were humorous, irreverent, and frequently obscene. The chorus was always composed of satyrs, mythological servants of Dionysus who were partly human but had horses' hooves, ears, and tails and wore enormous erect pballuses.

Satyrs were known for their wildness, drunkenness, cowardice, sexual appetite, and total lack of the virtues of civilization. The one satyr play that survives intact, Euripides' *Cyclops*, makes use of these attributes to produce a very funny

parody of Homer's tale of Odysseus and the Cyclops, a one-eyed giant named Polyphemus. In Homer's version Odysseus and his men land on the Cyclops' island and are captured after they take some of his food. Polyphemus locks them in his cave and promises to eat a few of them every day for dinner, but Odysseus gets him drunk and blinds him, enabling the men to escape. In Euripides' version Silenus, an old man who cared for Dionysus in his youth, has been shipwrecked on the Cyclops' island with the band of satyrs he leads, and all of them are serving as slaves when Odysseus and his men turn up on the island. Silenus sells them the Cyclops' property in exchange for wine, of which he has long been deprived, but when Polyphemus returns unexpectedly Silenus is terrified and pretends that the Greeks have robbed him by force. The Cyclops imprisons Odysseus' men and eats two of them, but Odysseus plies him with wine, while Silenus does all he can to get some of the wine for himself. Eventually Polyphemus becomes drunk enough to think that he is Zeus and Silenus Ganymede, and carries the frantic Silenus off into the cave. While he is gone Odysseus prepares a burning stake for blinding the giant, but the satyrs, who have promised to help him, prove to be too cowardly to do so. Odysseus gets his crew to help instead, and they blind the Cyclops and escape, taking the chorus with them.

The origins of the satyr play and those of tragedy are probably linked. Aristotle says both that tragedy grew out of the dithyramb and that it emerged from satyric drama; this satyric drama is probably not the Classical satyr play but its ancestor. The link between dithyramb and satyr play may have been made (sometime around 600 BC) by the poet Arion, who is said to have been the first to have his dithyrambs sung by choruses of satyrs. The word "tragedy" itself, which means "goat song", may come from the satyrs of such choruses; although depictions of satyrs on Greek pottery suggest that at an early period their non-human features were those of horses rather than goats, the satyrs in drama may well have disguised themselves as goats or acted like goats.

One ancient explanation for the development of satyr plays into their Classical form is that as tragedy developed from the dithyramb (originally a hymn to Dionysus), the tragedians started to use plots that had nothing to do with Dionysus; this annoyed the audience, and to satisfy them the poets invented the satyr play. More modern ideas are that the satyr play started from a humorous part of a tragedy (functioning to relieve tension like the grave-diggers in *Hamlet*) that was gradually split off, or that satyr plays were a genre parallel to tragedy that evolved somewhere in the Peloponnese while tragedy was emerging at Athens. In any case, the structure of satyr plays seems to be much like that of tragedies, though the length of the *Cyclops* suggests that such plays were in general much shorter than tragedies. They were probably performed, like tragedies, by three actors and a chorus of 12 (later 15).

According to legend, the first writer of satyr plays in their classical form was Pratinas of Phlius at the beginning of the 5th century BC; he was one of the most important and prolific writers of such works, but almost none of his output survives. Pratinas' son Aristias was another great writer of satyr plays, as was the tragedian Aeschylus, parts of whose satyr play *Dictyulci* have survived on papyrus. Euripides had a tendency to replace satyr plays with tragedies that had happy endings, such as the *Alcestis*, or with humorous pieces that did not use a chorus of satyrs; it is possible that Sophocles too may have written such "prosatyric" plays. Both dramatists, however, also wrote a number of satyr plays; Euripides' *Cyclops* survives intact, and a large portion of Sophocles' *Ichneutae* has been found on papyrus.

In the 4th century BC the production of satyr plays declined, and their number was reduced to one per tragic festival, rather than one per trilogy. The genre was revived in the Alexandrian period and still kept its chorus of satyrs, although these late satyr plays seem to have been concerned with contemporary events as well as with mythology. Eventually the genre inspired a type of Latin satyr play in Rome but died out in Greece. The satyr play has remained essentially a dead form to the present day, though the *Cyclops* and the *Ichneutae* are occasionally performed, the latter sometimes with a good deal of modern creativity supplying the missing portions.

Scepticism

The philosophical denial of the possibility of human knowledge

There are varieties of scepticism. Natural scepticism is simply asking for sufficient evidence before trusting some claim. This mode of doubting protects people from ignorance or credulity. Philosophical scepticism goes far beyond this.

Scepticism comes from *skeptomai*, which means "I inquire, consider, reflect". Inquiry can lead to answers (*dogma*), or to confusion when there is no reliable way to decide between competing answers.

Philosophical scepticism challenges all claims to knowledge by seeking to show that all is confusion. Philosophical scepticism challenges all epistemologies. Doubting, or withholding belief, until satisfactory reasons to believe are offered is the core of the sceptical method.

The Greek sceptics claimed they were the intellectual descendants of Socrates. They believed that the Socratic claim to ignorance, "I only know that I do not know", was not due to inadequate inquiry. Socrates could not know because no inquiry will ever find any answers.

Actually the real fountainhead of scepticism lay not in Socrates, but in his opponents, the Sophists. These teachers had expressed the confusion felt by many Greeks at the contradictory answers of the Presocratic metaphysicians, and the scepticism implicit in their thought. In addition, the flood of

conflicting ideas challenging traditional belief after Alexander the Great's conquests and the loss of meaning in public life with the end of independence of the city state made despair common.

The sceptics attacked the claims to knowledge made by the dogmatic philosophers, especially the Stoics and Epicureans, by raising the problem of the criterion (Sextus Empiricus, *Outlines*, I. 21). To answer questions about how a person has acquired knowledge of something, rules of evidence need to be offered. Reasons need to be given. The reasons which support a truth claim (or a value judgement) need in turn to be supported. This eventually leads to an infinite regress, or to circular argument, and not knowledge, they claimed.

Ethically the sceptics rejected positive knowledge of ethical values. For practical reasons they usually adopted a strategy of behaviour that accommodated them to the values prevailing in the community.

Philosophical scepticism began in the Hellenistic age with the teaching of Pyrrho of Elis (*c.*363–273 BC). His goal was peace through an apathetic state of mind (*artaraxia*). Freedom from care through an indifferent attitude was the goal of the sceptics in general (Sextus Empiricus, *Outlines*, I. 8–12).

Pyrrho's ideas were popularized in Athens by his student, Timon of Phlius (320–230 BC). He used lampoons (*silloi*) to attack dogmatic claims. This form of scepticism claimed to be unable to decide if the dogmas of the Stoics and Epicureans could be proved. Since he was unable to decide if something was fact or error, the wise man should suspend judgement until proof could be offered.

In the 3rd century BC a more radical form of scepticism appeared. The Middle or New Academy of Plato became the centre of Academic scepticism. The first of the Academic sceptics was Arcesilaus of Pitane (*c.*316–240 BC). His arguments attacked the Stoic criterion of knowledge.

The most important of the Academic sceptics was Carneades of Cyrene (*c.*215–129 BC), who also headed the Academy in Athens. He taught that nothing can be known with certainty, but that there are degrees of probability which will assist the wise when deciding how to act. He was succeed by Clitomachus (Hasdrubal) of Carthage (*c.*270–200 BC). Clitomachus was a dedicated popularizer of the arguments of Carneades. Little remains of his 400 works.

The later sceptics revived Pyrrhonism at Alexandria. They include Aenesidemus of Cnossus (*c.*80 BC–AD 30), Agrippa (dates are unknown), and Sextus Empiricus (*c.*AD 163–210). The last of these preserved the sceptic tradition. In his works Sextus discusses the methods of his predecessors including the use of modes (tropes) of doubting used to attack empirical claims. Essentially these pile enough differences in sense impressions to create doubt, so suspension of judgement is warranted. He also presents arguments for attacking rationalist claims to knowledge.

Eventually Greek teachers and Roman students of the Academy, such as Cicero, were to spread scepticism to Roman literature where it would be refuted by Plotinus and Augustine. The success of these critiques of scepticism was to last for over a thousand years.

The Renaissance introduced western Europe to the Hellenistic philosophies. By the 1500s Greek editions of Sextus' books were being printed. These printed editions were based on manuscripts preserved in the Greek-speaking east since the advent of Christianity.

Sceptical thought had played some role in the theology of the east. The early Church Fathers had made some use of it. Usually they were opposed to the sceptics because the latter were seen as a threat to Christianity. Gregory of Nazianzus (*c.*330–89) argued that the sceptics were to be lumped with Greek philosophers in general as incompatible. The Fathers occasionally used sceptical arguments to advance the faith.

In the following centuries occasional references to the sceptics can be found in Byzantine thought. In the 14th century a few Byzantine thinkers revived sceptical arguments. Their thought was opposed by Theodore Metochites (1260–1322) in his *Miscellanea Philosophica et Historica*. Others also worked on sceptical issues, including Gregory Palamas (1296–1359). Little use was made of scepticism after the fall of Constantinople in 1453.

Schism

Schism is a term designating the separation of a group from the main body of the Church due to disagreements on doctrinal, administrative, or other issues. This separation, however, is not absolute and irreconcilable but rather, as pointed out in the definition of "schism" given by Basil the Great, "capable of mutual solution" (J.B. Migne, *Patrologiae Cursus Completus, Series Graeca*, 32. 665). The term is first found in the New Testament and, although in patristic writings "schism" is distinguished from "heresy" – a much stronger term denoting a deviation from "correct faith" – schismatics have often come to be regarded as heretics.

The long history of Christianity displayed many schismatic tendencies. Some of them, particularly those of the 5th and 6th centuries, concerning the interpretation of Christological doctrine, resulted in permanent splits, such as that of the Nestorians and Monophysites who subsequently maintained a separate existence. These earlier schisms were mostly a natural consequence of heresies. From the 9th century onwards, however, the causes of schisms assumed a more personal character and the usual motives were the attempts of the emperors to exceed their prerogatives and privileges. Yet most of these schisms – such as the Photian schism of the 9th century, the schism known as "the affair of the tetragamy" of Leo VI in the 10th century, and the Arsenite schism of the 13th century – were temporary rifts and were eventually resolved. In many ways, however, all these ecclesiastical conflicts, from the 4th century onwards, may be regarded as the onset of an estrangement that was taking place within the main body of Christians and that was to widen century after century.

This estrangement reached its climax with the so-called Great Schism of 1054 between the Latin and Byzantine Churches. In the history of Christianity the Great Schism is considered to be the most significant one, and the term "schism" is most habitually employed to denote this particular split. The alienation of eastern and western Christians was not a synchronic historical event that took effect everywhere at once. It was rather a lengthy and perplexing process, the origins of which can be dated back to the 4th, 5th, and 6th centuries, while its final stage did not occur until the middle of the 15th century. In this extended process two incidents are explicitly acknowledged by historians as reflecting the widening gulf.

First there was the conflict between pope Nicholas I of Rome and patriarch Photios of Constantinople in 863–67. The appointment of Photios as patriarch and the deposition of his predecessor Ignatios were clearly connected with the papal controversy. Different interpretations concerning the primacy of Rome and other important ecclesiastical centres were apparent already in the 4th century and were related to the crisis over Arianism and the Acacian schism (485–519). The dispute between the two patriarchs, Photios and Ignatios, was used by Nicholas I to enforce his claim for universal papal jurisdiction. Although Nicholas's legates had acknowledged Photios as the legitimate patriarch, Nicholas repudiated their decision and demanded a retrial. A council was held in Rome under his presidency in 863. Here Photios was declared deposed and Ignatios was restored as patriarch. This approach was unacceptable to the Byzantines, who regarded the Church not as a monarchy, as the Latins did, but rather as conciliar in structure. The Council of Chalcedon (451) had attributed to the bishop of "Constantinople which is New Rome" equal privileges, in keeping with those of Old Rome, which was the imperial city (canon 28). Thus Byzantines saw Nicholas's actions as an intolerable interference in the affairs of another patriarchate. Photios also caused an additional strain to Byzantine–papal relations by adding a doctrinal dimension to the jurisdictional conflict through the questioning of the so-called *filioque* clause. This came at a time when a strong political rivalry existed between the Roman and Byzantine Churches over the control of the newly converted tsar of Bulgaria, Boris (852–89). Photios then in an encyclical to the Eastern patriarchs presented a list of Latin errors, the most important of which was the *filioque*. He went so far as to suggest that it was heretical, since to affirm that the Spirit "proceeds from the Father and the Son" was to admit of two principles. Although the *filioque* was not used at that time in Rome, German missionaries had introduced the creed in Bulgaria with this addition. By this act Photios was aiming to persuade Boris to embrace the Eastern rather than the Western form of Christianity. Boris received baptism from the Byzantines and, despite the fact that he negotiated with Rome when Constantinople refused to grant autonomy, Bulgaria remained Eastern in its polity. Photios in his second patriarchate (877–86) remained in communion with Rome. But even though it appeared that the Photian schism came to an end, its underlying causes were never really solved.

At the beginning of the 11th century relations between Rome and Constantinople were allowed to backslide once more. Rome in 1014 added the *filioque* to the creed. Moreover, at that time, for reasons that still remain unclear, patriarch Sergios II excluded from the Diptychs (i.e. excommunicated) the name of the new pope Sergius IV. This meant that the loss of communion was there even before the second incident, which is recognized by historians as leading to the final rupture between the two parts of Christendom.

This new incident took place in the mid-11th century when Constantinople was at the peak of its medieval power, and the see of Rome had just reformed itself, after passing through a century of decadence and confusion. At the same time the Normans were invading the Byzantine provinces in south Italy, thus complicating the already fragile political and ecclesiastical relations between Rome and Constantinople. The matter became even worse when the Normans compelled the Greeks living in Byzantine Italy to comply with Latin practices. The patriarch, Michael Keroularios, retaliated by closing down all the Latin churches in Constantinople. A reconciliation effort was made by Constantinople, which included an invitation to a papal delegation. In 1054 pope Leo IX sent cardinal Humbert as his legate to Constantinople. Humbert was annoyed by the uncooperative attitude of Keroularios and excommunicated him in a bull, which was left on the altar of the church of Hagia Sophia. Keroularios, in turn, anathematized Humbert. These mutual anathemas have been identified

as the incident from which we may date the consummation of the schism. After these anathemas, however, relations between the two Churches continued to be unclear for many years. The quarrel was perceived by many as a simple misunderstanding, which would be easily resolved. Furthermore, it appeared not to have had a great impact on the Byzantines, who continued communion with the Latins on a local basis. Yet, doctrinally, culturally, and institutionally, the two sides had drifted so far apart that their estrangement proved to be intractable.

It was the sack of Constantinople on Good Friday 1204 by the Fourth Crusade that made even the laity aware that the split between the two sides was profound and decisive. For three days the crusaders were allowed to kill their fellow Christians as well as burn and ruin the sacred city of the Christian East. This act initiated a spirit of abiding bitterness and hatred. Thereafter the Latins were considered by most Byzantines as enemies of their Church and nation. Nevertheless, since then, efforts have been made to reestablish full communion between Eastern Christianity and the Roman Church. The attempts at union of the councils of Lyon (1274) and Ferrara-Florence (1438–39) failed: first because they were politically rather than spiritually motivated; and second because the overwhelming majority of the clergy and laity throughout the Orthodox world were not ready to accept the Latin doctrine of the *filioque* and the papal claims. Even in the last days of Byzantium, when the political situation became desperate due to the advances of the Ottomans, the animosity between western and eastern Christians was not lessened; many of the latter even came to look upon the Ottoman advance as a lesser evil than submission to the Latins.

At first sight, the whole story of the Great Schism seems to be one of political and personal conflict, often rooted in human folly and narrow-mindedness. Recently, however, historians looking at the underlying causes of the schism have stressed the importance of historical, cultural, and even ethnic factors. It is important to point out that the breach of communion between pope and patriarch occurred when the Church of Old Rome was under the influence of Germans. In fact, it was the Normans who made the restoration of communion between the two sides impossible. This led some writers to view the schism as a conflict not between the Latin and Orthodox Churches, but between Franks and (east) Romans, and to go so far as to suggest that the Franks used the institutional aspects of Christianity to keep the conquered (west) Romans in a submissive state (cf. J. Romanides, 1981). However, all the aforementioned factors found a suitable expression in religious and doctrinal differences. Nevertheless, many writers still hold that the schism was above all a matter of theology and doctrine.

Although geographically the Christian East and West could not be clearly delimited, differences in modes of thinking and theologizing were (and still are) very apparent. Orthodox theology was a patristic one based on the writings of the Greek Fathers of the 4th century. It was a theology that was lived and taught liturgically, principally through Eucharistic worship. Western Christianity, on the other hand, until the 12th and 13th centuries when it was influenced by the rationalism of Scholasticism, had a more rudimentary theology. It subsequently became common to consider Orthodoxy as more conservative, ritualistic, mystical, personal, and existential in comparison with Western Christianity, which was seen as more rationalistic, "scientific", and systematic. The two wings of Christianity, therefore, developed a very different outlook as far as church life was concerned. Their difference in theological outlook coloured not only the two fundamental issues of their controversy, which still remain unsolved, i.e. the teaching concerning the procession of the Holy Spirit and the limits of papal power, but also the less important issues involved in the conflict, such as the celibacy of the clergy, the use of the *azymes* or unleavened bread in the Eucharist, the manner of conferring confirmation, and the Western teaching on Purgatory.

The schism of 1054 is regarded as one of the greatest tragedies in Church history with far-reaching consequences for both Eastern and Western Christianity. It is connected to the fall of the Byzantine empire and the advance of Islam, to the failure of the crusades, to the Reformation, which divided the West into two hostile camps, and to the rivalry between Russia and Western Europe. Even the schism of 1923 that took place within the Church of Greece and resulted in the excommunication of a group of Greek Orthodox known as the "Old Calendarists", can be seen as part of the aftermath that followed the breach of communion between the Orthodox and Western Churches. The Old Calendarists refused to follow the Gregorian calendar, introduced by pope Gregory III in 1572, which the Greek Church officially adopted, and still continue to adhere to the Julian reckoning.

In the course of the centuries various attempts have been made to restore unity between East and West. On 7 December 1965 the mutual anathemas were revoked by both sides. Yet such efforts resulted in further tensions and oppositions because of the fear of many Orthodox of losing their identity and autocephaly, and also because of the additional Latin innovations made after the schism of 1054, specifically the dogma of the infallibility of the pope and his immediate and universal jurisdiction over the entire Church. Further complications in the relations between East and West were also added by Uniatism, which appeared in eastern Europe in the 16th and 17th centuries, the consequences of which are still apparent today. The Uniates follow the Byzantine ritual in their worship, but recognize the supremacy of the pope. Such partial unions have been regarded by Orthodox as imbued with proselytism and as an unacceptable form of "missionary apostolate" on the part of the Latin Church.

Scholarship, History of

Whether there is any Greek word that corresponds to the English "scholarship" may be doubted. Nevertheless it is clear from what is known of men of letters in antiquity that they engaged in activities that would fall within any ordinary definition of the term. The understanding and criticism of literature were stimulated by the existence of schools where Homer and other poets formed a substantial part of the syllabus, and the teacher was forced to explain the texts and answer questions. Apart from the numerous minor linguistic difficulties arising from archaic words in Homer there were bigger questions: how could one interpret suitably such passages as Hera's approaches to Zeus in *Iliad* 14 or the tale of Hephaestus catching Ares and Aphrodite in flagrante delicto in *Odyssey* 8? For that difficulty it seems probable that the method of allegorical interpretation was invented, apparently by Theagenes of Rhegion (*c.*525 BC).

A desire to illuminate literary history and the origins of genres becomes visible in Aristotle's circle in such works as his *Homeric Questions* or the lists of dramatists who had won victories in the competitions at the Athenian state festivals, and a teleological view of the world was naturally conducive to such inquiries. But most of what would nowadays be considered literary scholarship (I leave out of account philosophical monographs and commentaries on Plato and Aristotle) appears to be the invention of men working in Alexandria in the 3rd and 2nd centuries BC. The librarians at the Museum collected Greek literature systematically, and they must soon have been puzzled and dismayed by the number of texts that had unintelligible passages resulting from careless transcription, or – worse still – by serious discrepancies between copies of the same text, a problem very noticeable in the case of Homer. There were also questions of authenticity. Though our sources of information on all these matters are very fragmentary, it is clear that discussions in the Museum led to the development of a number of aids for the reader, some of them mundane, such as the possibility of marking the accents so as to facilitate reading or the insistence on dividing lines of lyric verse so as to respect the metrical units, and others more sophisticated, such as the use of symbols in the left-hand margin of texts to advise the reader of certain problems raised by the passages in question. And with all this there had to be a second-order literature, i.e. books about books. Some of these were detailed commentaries on the texts, in others the critic expounded a topic and offered solutions to the problems, sometimes with an explicit mention of the principles by which puzzles might be solved. An enormous quantity of such literature was produced in antiquity. The most important scholars and critics were Zenodotus, Callimachus, Aristophanes of Byzantium, and Aristarchus. None of their work survives in its original form; at best we have brief citations, more usually a substantially rephrased and abbreviated version of their views, often not specifically attributed to the original author. So it is not always clear to whom we owe the best ideas; it is for instance a matter of debate whether Aristarchus is to be credited with the important maxim that "Homer should be illuminated from Homer", in other words that one needs to explain difficulties as far as possible by looking elsewhere in the writings of the same author. The question then arose whether a unique feature could be accepted, and one anonymous scholar formulated the necessary principle that in Homer there are many unique words, without which there would have been a temptation to deal drastically with the text. As it was, some critics declared a number of passages "improper" for one reason or another, but fortunately they did not go so far as to delete the lines in question, which would have had disastrous consequences, since their judgement now seems to us to have been at fault in most cases. Nevertheless there are many stimulating observations to be found in the surviving sources, for example the note that remarks that in the first book of the *Iliad* there are no similes, or the statement attributed to both Aristophanes of Byzantium and Aristarchus that the end of the *Odyssey* is to be placed at line 296 of book 23. It is therefore extremely unfortunate that the only critical monographs to survive from antiquity in their original form are not by the leading scholars of the period *c.*275–150 BC but works of later date or of marginal interest. The earliest appears to be a discussion of Aratus' and Eudoxus' *Phaenomena* by the astronomer and geographer Hipparchus (*c.*150 BC); the most famous, assuming it to be genuine, the brief *Techne Grammatike* of Dionysius Thrax (*fl. c.*150–90 BC); others are an essay by one Heraclitus (1st century AD?) on allegory in Homer and part of a commentary by Didymus (1st century BC) on speeches 9–11 and 13 of Demosthenes; this is a careless and unimpressive piece of work by a man whose fluent pen made him almost proverbial.

Any author of reasonably high quality could become the subject of a commentary, especially if his works were adopted for the school curriculum. But the lion's share of attention went to Homer, a fact reflected in the bulk of the surviving scholia, that is, notes written in the margins of medieval manuscripts but deriving from ancient monographs. One especially

famous manuscript of the *Iliad* (Venice, Biblioteca Nazionale Marciana, gr. 454) has preserved a quantity of material not known from any other source, with many snippets of information or judgements attributed to their authors. This manuscript gives us an idea of the specialized and detailed nature of studies devoted to Homer, including a great deal of a book by a certain Nicanor (*fl.* *c.*AD 130), on the correct way to punctuate the more complex sentences in Homer; what was presumably a series of notes presented as a running commentary has been divided into tiny sections and inserted into the rest of the commentary at the appropriate places. A similar fate befell an equally specialized monograph on the lyric metres in Aristophanes' comedies: quite a few excerpts of work by Heliodorus (1st century AD) are embedded in the scholia to Aristophanes.

In the expanding and changing cultural world of the late Hellenistic period and the Roman empire, the types of scholarship developed in Alexandria continued to flourish and prove their value. In the Greek-speaking Jewish community of Alexandria the Old Testament was studied in the Greek Septuagint version. Difficulties in the text had already been expounded by one Aristobulus (*c.*150 BC), and he may have had some connection with the Museum, since he shows occasional awareness of Greek poetry. When the Christians began to study their sacred texts they too availed themselves of the tools of pagan culture. The most notable figure is Origen, active in Alexandria from 202 until 223, then in Caesarea until 253. He and some of his successors were keen exponents of allegory as a means of interpreting the scriptures, but he was also aware of other scholarly methods, and in his remarkable *Hexapla* he produced an edition of the Old Testament set out in six columns, a somewhat clumsy forerunner of the critical apparatus typical of modern scholarly editions. Origen was not unwilling to use the techniques of the pagan scholars of Alexandria in dealing with the Bible; the same is true to a greater extent of the members of what is generally treated as a rival school in Antioch, whose leading exponents Diodore of Tarsus (d. 394) and Theodore of Mopsuestia (350–428), though ignorant of Hebrew, showed an acute awareness of the problems of translation.

Just as there had been commentaries on Homer and other pagan classics, so too there were commentaries on books of the Bible, and by the early 6th century the number of such texts, though probably not equal in bulk to what had been written about the leading pagan classics, was substantial. But it was difficult, especially in an age of declining economic resources, for readers to find copies of all the commentaries they might wish to consult, and frequently there was repetition of material. A solution was found by selecting and amalgamating notes from existing commentaries or monographs; the new collections of material, generally known as scholia on pagan texts and catenae on books of the Bible, could be fitted into the margins of the codex form of book that had replaced the roll and become standard since *c.*AD 400. It is not known exactly when and where this important and time-consuming operation took place, but catenae are perhaps the invention of Procopius of Gaza (*c.*475–538), a leading member of an intellectual circle in which devout Christians continued the study of the pagan classics as part of the educational curriculum. Catenae and scholia, though very similar, exhibit one important difference: whereas material on pagan texts rarely gives the name of the scholar who is being quoted, many catenae make a point of naming the authors of each extract, and it is interesting to note that catenae preserve a fair number of observations by Church Fathers such as Origen and Theodore of Mopuestia who subsequently fell out of favour.

Since the 2nd century AD Greek literature had been dominated by the archaizing Atticist movement, which obliged authors to imitate as best they could the language of acknowledged masterpieces written when Athens was at its peak. Manuals of correct usage were produced in abundance; we still have those compiled by Moeris, Phrynichus, and Pollux. The fashion lasted much longer than might have been expected. Classical texts were studied as much for their stylistic qualities as their power to instruct or edify, and their place in the school syllabus was barely affected by the spread of Christianity. Authors were equipped with scholia so that teachers should never be at a loss when questioned by pupils, and what had been done for pagan authors was replicated for the one significant addition to the corpus of *Kunstprosa*, a selection of 16 orations by St Gregory of Nazianzus. No other substantial alterations seem to have been made to the curriculum and essentially the educational system remained unchanged until the end of the Byzantine empire.

The fragmentary nature of our sources makes it hard to discern any scholarly achievement of note in the period of Justinian (the preparation of the *Digest* falls outside the scope of this article). It is perhaps worth noting one specific controversy: at a church council held in 532 Hypatius, bishop of Ephesus, put forward a properly argued case against recognizing the works of Dionysius the Areopagite as genuine. Unluckily this pioneer of rational thought was a millennium ahead of his time and his view did not gain acceptance.

After the Dark Ages, which may be reckoned as falling between the death of the emperor Herakleios in 641 and the end of the 8th century, we find a literary scene not much changed except geographically, for some centres of cultivated urban life had been lost to the empire. Yet the libraries of Constantinople still contained many texts that have not come down to the modern world, and these were exploited by one outstanding figure, the patriarch Photios (*c.*810–?after 893), especially in his so-called *Myriobiblon* or *Bibliotheca*. The title is misleading and not authentic, and the habit of referring to each chapter as a "codex" is unfortunate, because it suggests that a personal library is being described. The work is in fact a series of notes and essays compiled for the benefit of his brother, describing books he had read. Poetry is barely represented, but there are accounts of many texts now lost, for which Photios is the best or the only source; his comments on their stylistic merits or failings, while couched in vocabulary he may have acquired from predecessors, are not just plagiarism and show a well-developed literary sensibility. He was also alert to problems of authenticity and interpretation of texts, for example in one passage ("codex" 230, p.270 a 17) he uses an adapted form of a principle cited earlier when he says "Who could be more suitable to interpret St Cyril than Cyril himself?" A more remarkable statement occurs in his *Amphilochia* (chapter 152) where, basing himself at least in part on an earlier patristic writer, he states that heretical doctrine can arise from small faults in texts such as the loss or

addition of a single letter, or a faulty accent or inadequate punctuation.

No later Byzantine scholars quite equalled Photios. But much energy was devoted to preserving the Classical literary heritage. In the 10th century the emperor Constantine Porphyrogennetos and his circle attempted an encyclopaedic compilation of useful knowledge arranged in categories, which survives only in part and may never have been completed. From much the same period comes the *Suda* or *Suidas*, a large dictionary and encyclopaedia designed to help the reader of the classics of pagan and patristic literature. The polymath and professor of philosophy Michael Psellos (1018–78?) has left a number of essays on literary themes, including one on the ancient novels by Achilles Tatius and Heliodorus, and another on the respective merits of Euripides and George of Pisidia (the latter too poorly preserved to be properly assessed). Archbishop Eustathios of Thessalonica (1115–95) was an indefatigable compiler of commentaries on Homer and other authors. He and his fellow bishop Michael Choniates of Athens (1138–1222) had access to some texts that did not survive the onslaught of the Crusaders in 1204, and their quotations from such works are valuable; their own contribution to scholarship, however, probably amounted to little more than maintaining tradition in the schools.

That tradition had to be restored when the Byzantines recovered their capital in 1261, and during the Palaiologan period that followed, despite a deepening economic crisis, there was much scholarly activity of a high calibre. Particular credit is due to Maximos Planudes for his wide interests. *Inter alia* he prepared a recension of Plutarch and a somewhat bowdlerized edition of the *Greek Anthology*, and tried to improve the text of Aratus' poem *Phaenomena* by substituting lines of his own for passages that were now known to be astronomically erroneous. Less wide-ranging but in a way more important was the work of the 14th century scholar Dimitrios Triklinios on Greek tragedy and comedy. Triklinios understood Classical metre much better than anyone else in Byzantium, and he used this knowledge to correct many faulty verses; his corrections in many cases are accepted by modern editors, a fact that distinguishes him from other Byzantine scholars.

The final stages of Byzantine scholarship can be said to have taken place in Italy. The diaspora of refugees began well before the Turkish capture of Constantinople, and many educated men came to Italy in the hope of making a living as teachers. The most notable refugee was a clerical member of the delegation sent to the Council of Florence, Bessarion, who soon after settled in Italy and was made a cardinal. His astonishing personal library became the basis of the Marciana in Venice through his donation of 1468. But he was not simply a bibliophile, and though his marginal annotations to the texts he read do not demonstrate a particularly happy touch in making suggestions to heal corrupt passages, his pamphlet dealing with the disputed verse in St John's Gospel (21: 22) is important for the way it casts doubt on the wording found in the Vulgate.

Once the study of Greek took root in Italy it could spread to other western countries, especially with the aid of the printed book. Many of the early editions are due to Aldus Manutius, who did not always succeed in finding in Venice plentiful manuscript sources and collaborators of high ability. But he had great success with one of the Greek refugees, Markos Musuros (1470–1517), who prepared editions of Aristophanes and other authors, and at his best did excellent work towards the restoration of corrupt texts. From the middle of the 15th century onwards, however, Greek scholarship gradually became an international activity, with various western countries in turn producing a crop of eminent scholars, while Greece itself languished under Ottoman rule. The most remarkable personality from Greece in early modern times was Adamantios Korais (1748–1833), born in Smyrna but resident in Paris for much of his life; in addition to contributing to the Greek language question he published editions of the classics and made many acute conjectures that have won the admiration of modern critics. But he does not seem to have had close contacts with the German scholars of the day who were transforming the study of the classics into a science of antiquity, the study of ancient civilization as a whole.

Schools and Universities

The word "school" is of Greek origin: *schole* means "leisure, liberty from waged work and affairs of state". This leisure time could be devoted to scholarly studies. In this way the place where such occupations were practised received the same name. Through Latin (*schola*) the term then passed into many European languages. The "university" (from Latin *universitas*, "totality, teaching staff"), however, is a product of medieval western Europe; it did not exist in an institutionalized form in the Byzantine empire. Nevertheless facilities for a higher schol-

Schools: primary school in Athens. There is compulsory education for nine years in Greece today.

arly education already existed in Classical times (and later in the Byzantine period), but one should rather speak of academies or colleges.

An essential aspect of schools and academies in antiquity and in Byzantium is that they were mostly organized on a private basis. The state was not responsible for education and therefore there was no compulsory schooling or any continuous support for academies – it happened only occasionally that some project received support – or any permanently employed teachers. On the other hand, society as well as state authorities had an interest in passing on the cultural values of their civilization to the younger generation to make good citizens of them. In addition, the state was intent on getting good staff for its civil service and thus had a natural interest in enabling children and young people to obtain a comprehensive general education.

Fixed educational forms existed from approximately the 6th century BC. One of the few organized schools of this period was to be found in Sparta. Boys there were educated under state control between the ages of 7 and 29. In addition to elementary teaching in the basic principles of reading and writing, music and sports were taught. To a large extent the education was oriented towards the military in order to prepare boys for a life as soldiers. Girls received a similarly regulated education meant to prepare them for their social roles as mothers and educators of their children.

These elementary schools, which were mostly private, were also found in other regions of Greece. In Athens this educational form must have existed from at least the 6th century BC, as widespread writing skills demonstrate (e.g. written votes for citizens). Normally, elementary schools were run by a single teacher (the so-called *grammatistes*, from Greek *gramma*, "letter") who taught children between the ages of 7 and 14 in his private room. The furnishing was scanty: an easy chair for the teacher, simple benches or stools for the pupils, no tables. Wax tablets and slate pencils or papyrus and ink served as writing materials. The lessons at the *grammatistes* consisted of writing, reading, and arithmetic. Children learned to write by a strictly systematic, bottom-up method: first single letters, then syllables, and finally whole words. Reading was practised in the same way. Memorizing and reciting texts went together with reading them. The pedagogical method was limited to passive instruction, and corporal punishment often used. Since the elementary schoolteacher had to support himself from grants by his pupils' parents, his social standing was not very high. Nor was there any special training for teachers; anybody who could write and read was allowed to act as a teacher. There were no fixed holidays, but no lessons took place on the numerous monthly feasts and holidays.

In the 5th century BC it was the sophists (primarily philosophers and scholars who truly distinguished themselves as educationists) who, more than any others, helped to raise

education to a higher level. They gathered young people around them to offer them a more ambitious intellectual training that lasted several years. This was, however, a collective instruction rather than an institutionalized schooling. The sophists were "travelling teachers" who went to different regions and villages demonstrating their knowledge in order to gain new trainees.

From about the 4th century BC true schools were created instead of individual educational schemes. They provided a secondary education that lasted two years. Boys especially, after finishing elementary school, i.e. at about the age of 14, were instructed – sports and military training apart – in theoretical subjects to achieve the so-called *enkyklios paideia* ("all-round, general education"). Besides scientific subjects (viz. geometry, arithmetic, music, astronomy) literary studies were mostly pursued. The Classical Greek writers – mainly poets, but also historians – were read, and their works were analysed and explained from a lexical and a grammatical perspective as well as in relation to their contents. The theory of grammar, which was an independent discipline, was treated too. Moreover, pupils had to do practical exercises in the form of literary essays.

These educational institutions, the so-called ephebic colleges (from Greek *ephebos*, "boy who has reached puberty"), were dependent on the particular town or municipality, which undertook to pay the teachers (Greek *grammatikos*, "grammar teacher"), though often private donors had to help out. Originally, these schools were compulsory for young men but over the centuries they gradually became elite schools for rich parents' children in the same measure as instruction in the humanities became more significant. The teaching place was the so-called *gymnasion* (the German term *Gymnasium* corresponds to the English "college") which originally meant sports field. There were comparable higher schools for girls, but here instruction was limited to music and literature.

In the Classical and Hellenistic periods it is impossible to draw a clear line between secondary and higher education. But scholarly instruction concentrated on such subjects as rhetoric and philosophy, which were seen as the main pillars of education. Specialized teachers, i.e. rhetoricians or sophists, gathered groups of pupils around them and trained them – over a period of up to five years – in theoretical and practical rhetoric in a private and friendly atmosphere. From the 2nd century BC Rhodes was particularly famous for its rhetorical schools. There were schools for philosophy as well, as in Athens, where teachers conveyed their philosophical opinions in lectures and personal conversations with the pupils, together with explanations of Classical authors. The two kinds of higher education competed with each other, but also mutually influenced each other. Teachers in these institutions had a high social standing, often occupying honorary state positions. It is striking that no professional training conveying practical skills (except for medicine) was offered in the higher schools. Special skills could only be acquired by practising with a specialized instructor.

In late antiquity the state, represented by the emperor, increasingly intervened in educational policy in order to induce the towns and municipalities to open new schools and to ensure the teachers' payment. There were practical reasons for this, since the state needed trained civil servants for administrative tasks. Christianization did not have any far-reaching influence on school education since religious education was regarded as the responsibility of the parental home. Schools continued to pass on Classical "pagan" values. As to higher education, centres for special subjects arose in different towns of the empire: Antioch for rhetoric, Athens and Alexandria for philosophy; Berytus (Beirut) for the new subject jurisprudence (under the influence of Roman legislation).

In the Byzantine period educational structures from antiquity were in general adopted almost without any change, but with certain individual developments. From the 5th century Constantinople became the centre for education, retaining this status until the 15th century. Elementary teaching could be obtained in almost every town, even in provincial ones, while secondary education was available only in the larger towns. Of course, not every member of every social class was able to do so. Girls especially received a rudimentary education in reading and writing at best. Primary-grade schoolmasters still had a bad reputation. Secondary-grade private tutors however were appreciated socially, living on payments by their pupils or partly supported by patrons. In this period, as in late antiquity, support for secondary schools and academies for the education of civil servants (and of clerics for Church offices), doctors, and jurists is noticeable. Apart from private schools public ones were founded and maintained by the state (i.e. by the emperor or by the Church), which ensured that the state and the Church retained substantial control of education. The founders won great fame, not to speak of the practical benefits, for themselves because by training people they could expect to have loyal civil servants and clerics. Nevertheless, one cannot speak of state institutions since they were connected to an individual, after whose death they stopped functioning.

The *grammatikos* or secondary-school teacher instructed his pupils mainly in Classical Greek. As the written and spoken languages drifted apart, the schoolmaster's task of teaching the grammar and literature of antiquity became more important.

The last stage of education was rhetorical training in reading the Classical and post-Classical orators and also in writing and giving lectures. At least in Constantinople there were several schools of grammar and rhetoric. The pressure of competition among teachers was sometimes high and schoolmasters were often tempted to woo pupils away from each other.

A formal institution, however, that today we would call a "university", cannot be found in this period. Over the centuries different emperors made isolated attempts to guarantee a higher education – for the above-mentioned reasons – by intervening personally. In the 5th century, for example, there was a higher school in Constantinople that offered Greek (and also Latin) rhetoric, grammar, philosophy, and jurisprudence. But in the 6th century it was already beginning to decline. During the following centuries individual foundations were again and again patronized by emperors to support higher education. In the 11th century under emperor Constantine IX Monomachos schools for philosophy and jurisprudence were created for the training of high-ranking civil servants, lawyers, and notaries. In the 12th century a Church academy, the so-called Patriarchal School, was founded in Constantinople that particularly offered lessons in theology, as well as in grammar and rhetoric for future clerics and monks. The sources give no

clue as to whether it still existed in later centuries. In the late Byzantine period new educational centres arose in places other than Constantinople, e.g. in Thessalonica and in Mistra. Imperial patronage, however, decreased as the state became more and more impoverished, which is why many scholars emigrated to western Europe.

After the fall of the empire the Orthodox Church as the only official Greek institution made it its duty to maintain and to pass on the traditions of Byzantine education during the long period of the Tourkokratia. A newly founded school in the vicinity of the patriarchate (perhaps a revival of the Patriarchal School) covered secondary education. Elementary teaching, in former times mostly delivered by parish priests, remained almost unchanged over the centuries. New methods, particularly educational reforms, gradually came in from the West.

After the establishment of the free Greek nation (1821) the educational system was also structured anew. In the course of the 19th and 20th centuries a three-tier system was established that was essentially adopted from western Europe: the lower or primary level at primary school (six years of education) which is followed by higher schools divided into the so-called secondary level 1 or *gymnasion* (three years of education) and the secondary level 2 or *lykeion* (again three years of education). The third level finally is university. There is general compulsory education for nine years, i.e. for primary and secondary level 1. Secondary level 2, apart from schools providing a general education, includes specialized and professionally oriented educational branches. It also serves to prepare pupils for university. There are also private schools as well as church high schools that admit only boys. Teacher training is now regulated by the state and primary teachers are trained in pedagogical academies. Graduates of different university faculties, who are not compelled to acquire didactic skills, are engaged as teachers for the secondary levels. Recently, however, these posts have been given only to the best performers in a competitive examination.

In 1837 the first university (Greek *panepistimion*) in the modern sense was founded in Athens with originally four faculties: theology, philosophy (humanities and sciences), law, and medicine. Technological academies such as the polytechnic university (1836) gradually sprang up. In the course of the 20th century more universities were founded, in Thessalonica, Patras, Ioannina, Thrace, on Crete, in the Aegean, on Corfu, and in Thessaly. As a member of the European Union, Greece is now involved in many cultural programmes that support the exchange of university lecturers and students.

Scopas *fl.*360–335 BC

Sculptor

Though Scopas is counted as one of the greatest of Classical Greek sculptors, our definite knowledge of him, as with all named ancient sculptors, is slight and partially suspect. What we can reasonably guess from suggestive but unreliable traditions and remains widens our discernment but is also more hazardous. The remaining sculpture and testimonia, however, are so important for our understanding of ancient Greek art and so beautiful that we must make the effort: unreliability is not negation. And the ancient Greeks were excellent judges of their art, so that the traditions, even if unverifiable, can lead our eyes and minds to a just appreciation. Because Scopas was traditionally one of the three great sculptors of the late Classical age – the decades before Alexander's conquests – there are old traditions, modern attributions, and influences. Out of them an artistic personality emerges.

After the triumphs of the 5th century BC, 4th-century BC artists, while maintaining the basic Classical stylistic criteria of idealism combined with realism, felt the need to change and experiment. Where Praxiteles of Athens (Scopas' main rival) was sensuous and soft in his development of the female nude, and Lysippus of Sicyon interested in reforming the proportions of the male nude (providing, for example, a longer body and a smaller head) in portraits and increasing movement, Scopas of Paros was famed for emotional intensity, for a tragic, which means noble, sense of man's intense struggle. These three sculptors dominated the 4th century BC in the way that Myron, Phidias, and Polyclitus had dominated the 5th century BC, and determined much ancient art for hundreds of years – to Hadrian and beyond. Like their contemporary Plato, they looked to the towering past for their ideals and to the uncertain future in their ideas.

According to Pliny, Scopas was the son of the Parian sculptor Aristandros (working in 405 BC); Scopas is documented as active between 360 and 335 BC. Probably because it is the source of the world's most translucent marble for sculpture, Paros had a long sculptural tradition, including Aristion in the Archaic age and Phidias' pupil Agoracritus in the high Classical age. Scopas, who worked mostly in marble, was to be the greatest in this unbroken line.

We know that Scopas was as esteemed in his own age as in succeeding ages, because he was employed to work on the great projects of the period, including the temple of Athena Alea at Tegea, the Mausoleum of Halicarnassus, and the temple of Artemis at Ephesus. It is from the first of these that we get the best idea of his style.

At Tegea in the Peloponnese Scopas was an architect as well as a sculptor. The original temple had burned down in 395 BC and Scopas was at work some decades later. (The nearby temple of Nemea is so close in style and date that it seems that Scopas was active in the neighbourhood.) Pausanius says of Tegea: "The present temple is far superior to all other temples in the Peloponnese on many grounds, but particularly as regards its embellishment and size" (8. 45). The temple is the best example of 4th-century BC Doric; it was peripteral with a pronaos and opisthodomos and very narrow. Though it was Doric, Scopas brought from his home island a new spirit of lightness and delicacy: the columns were slender, and the interior columns were very early Corinthian with Ionic elements. On one of the pediments Scopas sculpted the *Hunt of the Calydonian Boar* (whose hide the temple displayed), and on the other the *Battle of Telephus and Achilles in the Kaikos Plain*. Many fragments of these sculptures survive and can be admired in the local museum and in the National Archaeological Museum in Athens. For the temple, Scopas also sculpted an *Asclepius* and a *Hygeia*, whose head, with its expression of divine sweetness, survives (National Archaeological Museum). He also made another *Asclepius* for a temple of Gortys in Arcadia. The squarish warriors' heads from the pediment, though battered, show brooding, deep-set eyes and furrowed brows – the new emotionalism of the 4th century BC.

The Mausoleum of Halicarnassus was the most ambitious monument of its day (355–330 BC), and all good sculptors were eager for employment there. According to Pliny (36. 30) Scopas worked on the frieze of the east side. The panel most usually attributed to him, now in the British Museum, depicts an animated *Battle of Greeks and Amazons*.

Pliny also says (34. 95) that Scopas carved and decorated one of the columns from the famed temple of Artemis at Ephesus, but the remains are too scanty to form a judgement. Of the other statues or copies of statues attributed to him, the finest are probably the deep-eyed *Meleager* (perhaps original) in the gardens of the Villa Medici and the copy of the *Pothos* ("Longing") in the Museo dei Conservatori, both in Rome. For his *Pothos*, Scopas sculpted a youth with crossed legs; his head looks longingly up with melting gaze. The Romans, who starting with Augustus carted off many of his sculptures to their capital, often copied this work, indicating its popularity. The lovely *Dancing Maenad* (a copy) in Dresden is thought to be an example of Scopas' new swirling movement. Callistratus wrote at length about it:

> Scopas, as if moved by some inspiration, imparted to the making of his statue the divine frenzy that possessed him ... The Maenad wrought from Parian marble has been transformed into a real Maenad ... You would have seen that, hard as it was, it became soft to resemble the feminine, though its vigour corrected the femininity, and that, though it lacked the power to move, it knew how to dance in Bacchic frenzy, responding to the god as he entered within ... (*Descriptions*, 2. 1–4)

Hellenistic critics considered that Scopas' forte was statues of the gods, a genre unfortunately very poorly represented among the surviving monuments. We know of a *Heracles* for Sicyon, an *Apollo* for Rhamnous, a bronze *Aphrodite Pandemos Riding a Goat* for Elis, an *Artemis Eukleia* for Thebes, a *Dionysus* for Cnidus, a *Hecate* for Argos, and many more: it seems that Scopas was in demand everywhere.

Given his popularity, originality, and skill, it is not surprising that his influence on the ensuing Hellenistic age was pervasive. It has been especially remarked on in the great *Gigantomachy* frieze from the altar at Pergamum (*c.*180 BC), now in Berlin. Although it can be frustrating trying to recreate the work and thought of a great artist from toppled stones, hopeful assumptions, and guesswork, Scopas will no doubt continue to provoke lovers of ancient art to do so, in the hopes that he may become for us ever clearer and closer.

Biography

Born in Paros, Scopas was active as a sculptor and architect *c.*360–335 BC. With Praxiteles and Lysippus he dominated Hellenic art of the 4th century BC. He is known to have worked on the temple of Athena Alea at Tegea, the Mausoleum of Halicarnassus, and the temple of Artemis at Ephesus. In antiquity he was famous for statues of gods.

Sculpture

The mythical Daedalus was viewed in the ancient world as being one of the earliest sculptors in the Greek world. Although he had associations with Crete, he was later thought to have been an Athenian and a member of the Erechtheid family. His name has been linked to "daedalic" statues, which were recognized by Pausanias in the 2nd century AD. These included a statue of *Aphrodite* on the island of Delos which Pausanias (9. 40. 3) believed had been given to Ariadne by Daedalus.

Daedalus' influence was seen by ancient art historians as giving birth to the Sicyonian school of sculpture in the Peloponnese, which in the fullness of time was to see the appearance of the master sculptor Lysippus. Pliny the Elder (*Naturalis Historia*, 36. 9) retains the tradition that the marble sculptors Dipoenus and Scyllis – thought by Pausanias (2. 15. 1) to be either the pupils or even the sons of Daedalus – settled in Sicyon and made the city a centre of the arts.

Some have seen the creation of monumental sculpture in the Greek world as deriving from contact with Egypt. This tradition, cited by the historian Diodorus Siculus (1. 97. 5–6) in the 1st century BC, links the composition – the Greek term is *rhythmos* – of Daedalus' work with that found in Egypt. Certainly the establishment of a Greek settlement at Naucratis, according to Herodotus during the reign of the pharaoh Amasis, may have facilitated such contact. Whether or not Greek sculpture was derived from Egyptian proportions, it has long been recognized that *kouroi* – naked male statues of the Archaic period – had been carefully designed with set proportions. Such statues were used both as dedications within a sanctuary as well as for placing on tombs. An example of a funerary *kouros* comes from Anavyssos in Attica, where it was erected over the grave of one Croesus who had been killed in battle. *Kouroi* were a regular dedication in the Archaic Ptoan sanctuary in Boeotia.

The Peloponnese, and especially Argos and Sicyon, seems to have been innovative in sculpture, particularly monumental bronzes. Some of the key personalities, fulfilling commissions from both the western and the eastern Greeks, were the sculptors Ageladas of Argos and Canachus of Sicyon. The former is known to have accepted both private and public commissions from the Greek colony of Taras in southern Italy for statues which were erected at Olympia and Delphi, and the latter made a bronze statue for the important sanctuary of Apollo at Didyma in western Asia Minor. Argive sculptors were responsible for a pair of archaic *kouroi* which were dedicated to the Anakes (the Argive version of the Dioscuri) at Delphi; the pair were formerly known as Cleobis and Biton after the sons of the Argive priestess of Hera who according to Herodotus (1. 31) were commemorated by statues at Delphi.

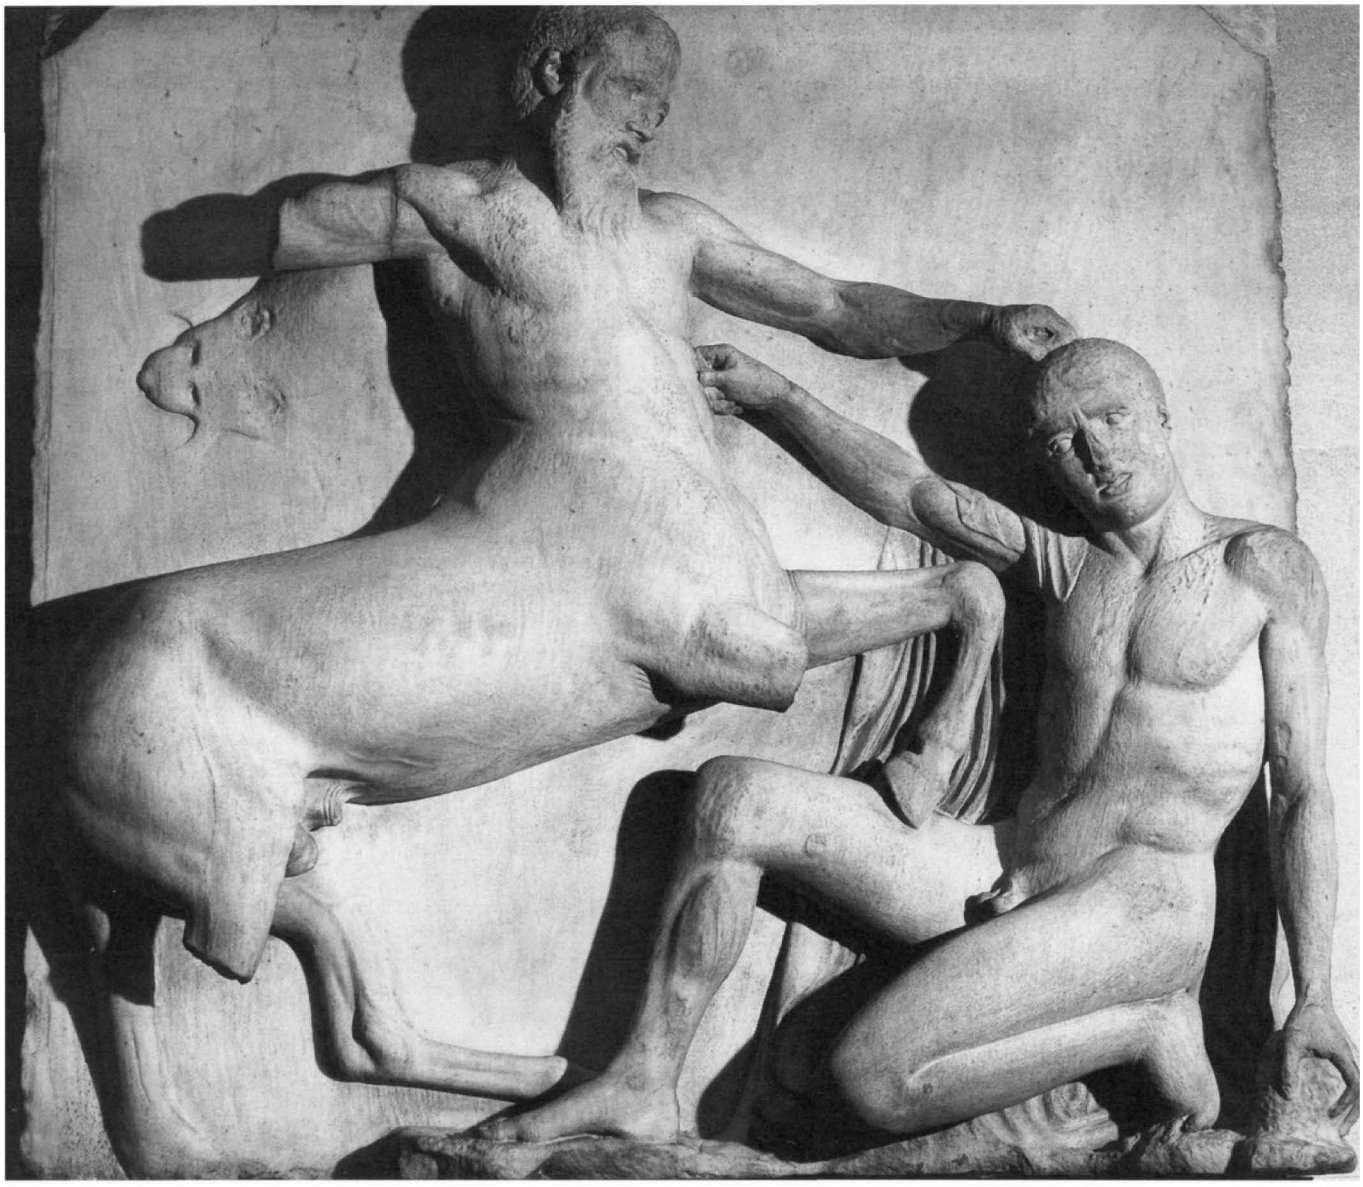
Other schools of sculpture in the Archaic period were located on the islands of Aegina and Naxos. Aeginetan sculptors seem to have been in demand for making victory monuments at Olympia. Marble versions of their work can be glimpsed in the marble pediments, showing the two separate expeditions to Troy, from the temple of Aphaea on the island. The Naxians seem to have had one of the earliest schools of sculpture. Their sculptors made such works as the colossal Naxian *kouros* dedicated at Delos, as well as the statue of the Naxian Nicander who dedicated a *kore* (statue of a young woman) to "the far-shooter of arrows" in the sanctuary of Artemis on Delos. The Naxians also seem to be responsible for a large marble sphinx dedicated at Delphi, where it rested on a 10-m-high Ionic column.

Due to the habit of signing works, a more detailed picture can be derived from Attica in the 6th century BC. It is clear that both Attic and non-Attic sculptors (such as Aristion of Paros) were active in creating funerary monuments (*kouroi* and stelae) as well as dedications in sanctuaries such as the Athenian Acropolis; for example some 17 sculptors – identified by name, and not all of them from Attica – are known to have worked on the Acropolis alone in the late Archaic period. It seems that around the end of the 6th century BC there may have been a move towards specialization either in funerary sculpture or in religious dedications.

The Archaic period also saw the increased appearance of architectural sculpture. One of the earliest uses was on the temple of Artemis at Corfu where the sculptor has conceived of the triangular pediment as a frame for a series of scenes of differing scales, dominated by a large central gorgon. The temple of Apollo at Delphi received new pediments thanks to the generosity of the exiled Alcmaeonid family in the late 6th century BC (Herodotus, 5. 62). The pediments featured rather static individuals, the *korai* differing little from the freestanding figures found dedicated in Greek sanctuaries or as funerary monuments. The late Archaic period also saw the appearance of highly decorated treasuries at the Panhellenic sanctuaries. One of the best known was the treasury of the Siphnians at Delphi, which was noted by both Herodotus (3. 57) and Pausanias (10. 11. 2). The building identified as the Siphnian treasury was decorated with monumental caryatids, a continuous frieze, and pedimental sculpture. After the Battle of Marathon Athens celebrated its victory over the Persians with a small treasury decorated in the Doric style with metopes of the heroes Theseus and Heracles (Pausanias, 10. 11. 4).

After the Persian Wars there was a move away from the static pose of *kouroi* and *korai*. For example, the replacement group of the tyrannicides (Harmodius and Aristogeiton) made by the sculptors Critios and Nesiotes and erected in the Athenian Agora, showed the pair of "heroes" in the process of striking down the "tyrant" Hipparchus in 514 BC; he was in fact the son of Pisistratus and the younger brother of the actual tyrant Hippias. An attempt was made to distinguish between their ages by showing one of the figures bearded, the other beardless. From the 470s BC comes the hollow-cast statue of a charioteer – part of a larger group – dedicated by the Sicilian tyrant Polyzalus of Gela to celebrate a chariot victory at the Pythian games at Delphi.

During the 5th century BC, perhaps due to the increasing use of bronze casting, there were numerous innovations in sculpture. One of the key figures who can be identified in this process was Myron of Eleutherae (in Attica). He is perhaps best known for his discus-thrower (or *Discobolos*) where the



Sculpture: Greek youth fighting a centaur on a metope from the Parthenon, 5th century BC, British Museum, London

sculptor has captured a moment in the swing which would never normally be seen by the human eye. The statue itself, though lost, has been recognized in a number of Roman copies. Before this, victors in the discus competition are likely either to have been shown standing holding a discus, or the nature of their victory would have been identified by the inscription accompanying the statue. Such action poses seem to have been the hallmark of Myron. For example, the victory monument for the runner Ladas was celebrated for capturing the runner leaning forward in anticipation of his prize (*Anthologia Graeca*, 16. 54).

A sense of proportion in sculpture was created by Polyclitus of Argos, apparently a pupil of the Argive sculptor Ageladas. He is known to have been interested in the theory of sculpture and was said to have written a treatise on the subject whose tenets were then put into practice by his creation of the canon or spear-carrier (*Doryphoros*). Certainly the distinctive Polyclitan pose – straight and flexed arms, head turned to one side, and straight and flexed legs – suggests the formation of a new style which was to have great influence on subsequent generations of Greek sculptors as well as the creation of an image for the Roman emperor Augustus.

Greek victories against the Persians, notably at Salamis and Plataea but also at the Battle of Eurymedon in the 460s BC, led to the production of a number of monuments to celebrate Greek prowess. This civic patronage may have given opportunity to gifted sculptors such as Phidias who not only became one of the chief overseers for the Pericleian building programme at Athens, but also produced some monumental chryselephantine sculptures. Two of his most famous statues served as cult images for the temples of Athena Parthenos at Athens, and Zeus at Olympia. At Olympia itself the remains of the workshop where Phidias did his work have been found. Neither statue has survived, though both are known from contemporary images, such as the Attic Baksy krater, or from Roman copies. Phidias himself also created a monumental

bronze statue of Athena Parthenos, apparently made to celebrate the Athenian victory at Marathon in 490 BC, which was dedicated on the Athenian Acropolis; the tip of the spear could apparently be seen as far away as Cape Sunium.

A number of highly sculpted marble buildings were raised in Athens in the 5th century BC as part of the Pericleian building programme. The most notable was the Parthenon, which housed Phidias' chryselephantine statue. This highly decorated building, with a continuous frieze, sculpted metopes, and two pediments, must have required teams of sculptors to complete it. Detailed accounts indicate the progression of the temple. At the same time the Acropolis was given a monumental entrance, the Propylaea, and in the 420s BC the bastion above the entrance received a new temple dedicated to Athena Nike and designed by Callicrates. This Ionic building was decorated with a continuous frieze, and the parapet around the temple was decorated with reliefs. This period also saw the erection of the Erechtheum.

Although much attention is focused on Athens of the 5th century BC some major sculptural schemes were being created elsewhere in Greece. At Olympia Phidias' chryselephantine statue of *Zeus* was placed in a Doric temple which was decorated with a sophisticated pair of pedimental sculptures depicting, respectively, the mythical origins of the games and the battle between the Lapiths and the Centaurs. The temple itself must have been nearly complete in 457 BC, as in that year the Spartans and their allies placed a dedication on the roof to celebrate their victory at Tanagra (Pausanias, 5. 10. 4). One of the architects of the Parthenon, Ictinus, was also apparently involved in the creation of the temple of Apollo Epikourios at Bassae near Phigaleia in Arcadia; although some would dispute this connection, the temple carried an internal frieze showing a centauromachy and an amazonomachy.

This tradition of architectural sculpture produced one of the seven wonders of the ancient world, the Mausoleum of Halicarnassus. This monumental tomb was built for Mausolus of Caria, a former Persian satrap. Although this was in western Turkey, technically beyond the Greek world, Mausolus' widow Artemisia engaged notable Greek sculptors to create an elaborate tomb after his death in 353 BC. The tomb was later dismantled, but it is clear that it had a continuous frieze showing an amazonomachy and a chariot race. Individual portrait statues may have stood between columns and the top was decorated with a chariot. Ancient writers such as Pliny the Elder and Vitruvius associate several Greek sculptors with the project: Leochares, Bryaxis, Scopas, Timotheus, and even Praxiteles.

During the 4th century BC a number of personalities in Greek sculpture emerged. In Athens Praxiteles came to prominence and was particularly celebrated for his creation of a naked Aphrodite displayed in a circular temple at Cnidus in western Asia Minor. Scopas, from the island of Paros, was regarded in antiquity as a rival of Praxiteles, no doubt due in part to having his name associated with the Mausoleum of Halicarnassus. One of the most innovative sculptors of the 4th century BC was Lysippus of Sicyon, who can perhaps be considered the creator of portraiture.

Although the literary sources, especially Pliny, allow us to identify a number of individual artists during the 4th century BC, many extant works are in fact anonymous. These include a group of bronzes from the Piraeus which may have been lost when Sulla destroyed the port in 86 BC. These fine works include an *Athena* and two statues of *Artemis*. Another high-quality bronze of this period is the statue of a youth found in the sea off Marathon.

Attic sculptors continued to make copies of famous Greek works in the Roman period to meet the tastes of the elite in the areas bordering the Mediterranean. A batch of marble reliefs from the Piraeus contains scenes copied from the amazonomachy on the shield of the Athena Parthenos; presumably some educated Roman wished to enhance his villa with elements from this major Athenian monument. An Athenian sculptor, Apollonius son of Archias, signed the bronze herm representing Polyclitus' *Doryphoros* which was found in the Villa of the Papyri at Herculaneum.

Sculpture continued to be created in the Greek east during the period of late antiquity, particularly under the patronage of Constantinople. It includes portraits of local governors, such as those erected at Megara and Athens. Some of the late antique sculpture is in marble, such as the relief of the archangel Gabriel at Antalya in southern Anatolia, derived from the quarries of Proconnesus which had been heavily exploited in the Roman imperial period. Low reliefs continued to be made in the Middle Ages, including representations of the Virgin Orans and Virgin Hodegetria.

Second Sophistic

Literary movement of *c.*AD 60–410

Philostratus (d. AD 249) coined the term "Second Sophistic" to create a connection between current rhetorical practice and the sophists of the Classical period. He marks the beginning of this "movement" during Nero's reign (*c.*AD 60), in the speeches (now lost) of Nicetas of Smyrna. This "Second Sophistic" continued until the sack of Rome in AD 410, and included such rhetoricians as Dion of Prusa, Herodes Atticus, his student Aristides (d. *c.*AD 181), Polemon, and Libanius. Much of the activity of these rhetoricians was in the realm of public performances in aristocrats' mansions, lecture-rooms, libraries, and amphitheatres, mainly in provincial cities such as Smyna, Ephesus, Antioch, and Pergamum, where their displays were often greeted by large, enthusiastic audiences.

Some idea of the variety of occasions for such performances can be gained from the two treatises on "epideictic" attributed to Menander Rhetor (3rd century AD) and from the *Techne* traditionally attributed to Aristides. These include instructions on how to compose speeches in honour of a city, at birthday and wedding celebrations, or to the emperor or other dignitaries. A very important part of a rhetorician's repertoire consisted of "political" declamations recreating mythological or historical situations, for example, a member of the delegation sent to persuade Achilles to return to the ranks (Aristides, *Orationes*, 52). Set-piece descriptions (*ekphraseis*), too, were popular and influential in other areas of literary production, for example in the works of the "novelists" Longus and Achilles Tatius, who are both described as "Sophists" in the manuscripts. The influence of these rhetoricians extends also to the great Church Fathers, almost all of whom were converts who had studied or taught rhetoric, for example, Gregory of Nazianzus (d. 390) and John Chrysostom (d. 407), who was a student of Libanius.

Many of the rhetoricians in this movement were active in state affairs, as ambassadors, as envoys sent to the emperor to speak in his praise or to secure privileges for their cities. So important was their eloquence that Vespasian established a salaried chair of Greek rhetoric, and Marcus Aurelius sponsored a chair of rhetoric that was worth 10,000 drachmas per year. Many later emperors reserved important offices for distinguished rhetoricians, some of whom moved up in the ranks of the imperial court to achieve even higher honours and more powerful positions.

The display speeches of the new "Sophists" were more than mere entertainment. Aristides, for instance, delivered speeches at festivals in all the great cities of the Greek-speaking parts of the empire, bringing to widely disparate audiences a common set of cultural themes and standards of taste and behaviour, fulfilling, in a way, Isocrates' dream of Panhellenism. The Church Fathers found in the rhetoric of the Second Sophistic a way of rehabilitating the eloquence of scripture and, in doing so, of helping their fellow Christians to achieve an identity of their own. What is perhaps most striking about this rhetorical movement is the fact that it was almost exclusively Greek, in spite of the dominance of Latin Rome over the entire Mediterranean basin. Even Favorinus, from the Gallic city of Arles, composed and delivered his speeches in Greek. In the Second Sophistic, then, we see no attempt to adapt to the culture of Rome, but a reassertion of Greek cultural values as a unifying force in an empire that was becoming more and more fragmented in the centuries before it collapsed in the west.

Summary

A term coined in the 3rd century AD by Philostratus to demonstrate the link between contemporary rhetoric and the sophists of the Classical period, the Second Sophistic was a literary movement that began in the 1st century AD and continued until AD 410. It influenced all Greek literature of the day and represented a reassertion of Greek cultural values.

Secularization

Secularization is one of the most commonly debated issues not only in sociology, but in philosophy, theology, history, and other disciplines as well. Originally, the term "secularization" was used in early modern times to signify the passing of ecclesiastical and monastic property to the control of a secular institution. The concept has since been incorporated into several theories, whose aim was to examine the role of religion in society in the wake of the continuing sociocultural evolution and change, especially with regard to modern times. There have been various secularization theories relating to specific aspects of this process across the centuries. Thus secularization was aptly described as a "multidimensional concept", while some scholars considered the secularization thesis as a modern myth. It is possible, though, without turning secularization into an ideology, to single out its basic postulates, which are useful for examining religious evolution and change in various contexts.

Generally speaking, secularization refers to the decline of religion either in theory and practice or in the public and private spheres. This phenomenon should be not equated, however, with the (hypothetical) complete disappearance of religion, since religion seems to belong somehow inherently to the human condition. Further, although there exist certain historical antecedents of secularization, this process is basically connected to developments in the western world in modern times. For example, the massive de-Christianization of western Europe in the 19th century was related to the specific socioreligious background and evolution of this particular geographical and cultural unit. Though exceptional in their secularity, these changes in western Europe have also influenced significantly the non-western world.

With regard to the Greek world, early forms of secularization can be located in the development of rationalism and scientific inquiry in ancient Greece, which contributed to an understanding of the world from a causal perspective and consequently to a relative desacralization of nature. Apart from this, the passing from pagan polytheism to Christian monotheism has also been considered as a major shrinkage of the supernatural realm from its numerous deities and supernatural beings to their replacement by the one God as the sole lord of the entire universe. Such developments did not signify a direct decline of religion, but opened the door for subsequent religious changes. After all, these were premodern societies in which religion played a vital role in all spheres of life as well as in the entire world order. The same is true with regard to the Byzantine empire, in which Orthodoxy as the official state religion was a most crucial parameter in the articulation of political ideology and permeated all societal sectors in a decisive way. Of course religious changes did take place during that period too, but they did not undermine the dominant role of Orthodoxy in society.

As far as the Greek world and its Orthodox tradition in modern times are concerned, the period of Ottoman domination is of paramount importance. Due to the privileges bestowed on the Orthodox Church after the fall of Byzantium, the patriarch became the head of the Orthodox *millet* ("community"). His jurisdiction was not confined to the religious domain alone, but concerned various other spheres (e.g. educational, judicial, social-communal, economic). This new status of the patriarchate of Constantinople enhanced substantially its role within Ottoman society. This may be also interpreted as a kind of worldliness due to the relative loss of its religious specificity and its involvement in manifold mundane activities and dealings with the Sublime Porte. Yet the patriarchate's religious role remained its most basic and characteristic feature throughout this period.

The main challenge for the Church appeared from the second half of the 18th century onwards under the influence of the Enlightenment. The Greek diaspora and students in western Europe as well as the merchant and trading communities initiated a major shift towards societal liberalization and modernization. Despite anticlericalist criticism, their intention was not to destroy the Church, but to limit its influence to the religious domain. Its polysemic role was of utmost importance at that time, thus social innovators tried to reform the Church partially rather than collide with it frontally. During the period of the Greek Enlightenment several such secularizing trends can be observed: the separation of various sectors (e.g. education, communities) from religious control and their independent development; the deflecting of interest from metaphysics and otherworldliness to worldly, practical, and socially useful issues; and the explanation of natural phenomena scientifically and empirically and not by reference to supernatural factors. These trends, though influential enough, did not alter radically the socioreligious establishment of the day and were met with the staunch reaction of the Church, which feared losing its privileges. But they acted as catalysts for subsequent change in the newborn Greek state.

The 19th century was marked by several important developments concerning the Church's role in Greek society. In the wake of social differentiation the Church lost its previous broad societal responsibilities and was subjected to the state. This shrinkage of religious influence, which resulted in the autonomous evolution of various sectors (e.g. education), was mitigated later due to popular reactions and the Church's worldliness, i.e. through its tranformation into an organ of the state and its involvement in vital national issues (e.g. the Great Idea). The social marginalization of the Church was effected also through the pluralization and cultural differentiation of Greek society under western influences, which allowed the existence and dissemination of anti-Orthodox and antireligious ideas by scientists and intellectuals despite ecclesiastical countermeasures. Yet, the consequences of secularization remained ambiguous, a fact attributed to the cultural specificity and idiosyncrasy of eastern Orthodoxy as distinguished from western Christianity. Despite the serious changes and problems created for the Church, secularization in Greece was limited and adapted to its specific exigencies. Orthodoxy, both as a personal belief system and as an institution, continued to exercise a powerful authority over the collective mentality of the Greeks. The same situation continued mutatis mutandis in the 20th century when the Church, despite the pervasive impact of westernization and modernization, still constitutes a crucial parameter of Greece's sociopolitical and cultural environment. This is clearly manifested in the fact that Church and state, despite numerous disagreements and conflicts, are still strongly bound together, and no separation between them is in prospect.

Modern Greece, despite its alliance with the western world, is a country continuously oscillating between its own traditions and the multifaceted challenges of modernity. This situation creates numerous paradoxes and contradictions. On the whole, popular sentiment remains close to the Church. Greeks may be very critical of their Church, but they do not intend to annihilate its power, but rather to ameliorate its condition and modernize it in certain ways. Although they do not follow meticulously the Church's directives, its influence permeates their entire cultural ethos – the phenomenon of "diffused religion". Historically, Greek society never wanted to sever its relationship entirely with the Orthodox Church, as has happened in many western countries with Roman Catholicism. This explains why secularization, despite its limited success, cannot neutralize the Orthodox factor.

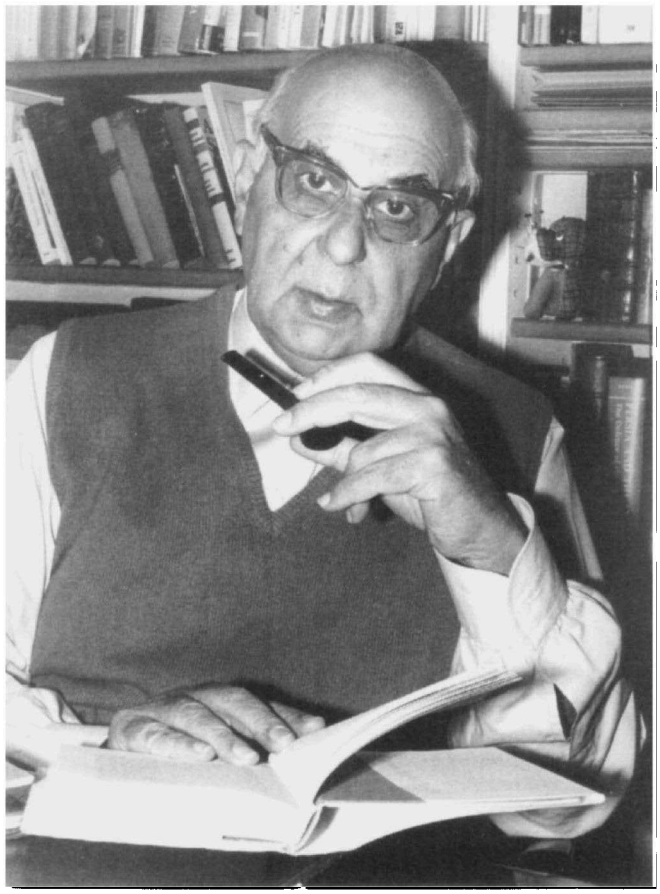
Seferis, George 1900–1971

Diplomat and poet

The title of Seferis's first collection, *Turning Point* (1931), was intended to suggest his own "turn towards the world": that is, away from the introvert and nihilistic tendencies which characterized much of the poetry of the 1920s and, indeed, his own juvenilia. It also proved to be a turning point for Greek poetry as a whole, heralding a period of literary experiment and innovation. The collection consists of 13 short poems in a variety of rhyming patterns and metrical forms, and the large-scale "Erotikos Logos", cast mainly in the traditional 15-syllable verse (*politikos stichos*) which dates back to Byzantine times. As such, it draws and builds on the tradition of the folk song but also of earlier poets who cultivated this verse form, particularly Vitzentzos Kornaros, Dionysios Solomos, Kostis Palamas, and Angelos Sikelianos. The theme of love, a recurrent one in Seferis's poetry, plays a dominant role in the collection. Likewise, the extensive use of myth and literary allusion he was to make later is already adumbrated here. Although poetically accomplished, *Turning Point* is the product of Seferis's apprenticeship in the Symbolist tradition. The same is true of *The Cistern* (1932), his poem closest to Paul Valéry's work and to the ideal of *poésie pure*, and of the early poems in the *Book of Exercises* (1940), a collection the coherence of which, as he saw it, is none other than "that provided by ten years of continuous effort towards poetic expression". It was the publication of the poem sequence *Mythistorema* (1935) – marking his abandonment of an indisputably masterful handling of strict metre and rhyme in favour of free verse – that established him as a key exponent of Modernism in Greece.

If the example of the Symbolists fostered in Seferis a proper regard for the aural quality of poetry, it also made him wary of the dangers to the language inherent in their wish to attain the condition of music. Like T.S. Eliot and Ezra Pound, he sought to revivify poetic diction which he believed should be an enriched form of contemporary speech; the notorious "language question" made this an even more daunting task for a Greek poet. A desire for clear, precise, more objective expression and the need to give voice to collective rather than personal feelings, already discernible in his earlier verse, grew more imperative. He thus turned to less personal and inscrutable symbols and was increasingly drawn towards dramatic modes, realistic forms of expression, personae, and myth. It was at this stage that he became acquainted with Eliot's work which functioned as a catalyst in the completion of *Mythistorema*. A tension between past and present runs through the 24 sections of this many-voiced poem, set in a Greek landscape, employing ancient myth and conveying a contemporary outlook. More than just relating to the Asia Minor disaster – for the Greeks the tragic aftermath of World War I – it is a powerful comment on, and exposition of, life in modern times: an atmosphere of fracture, of futility and cultural collapse, a sense of acute loneliness, of rootlessness and lost wholeness characterize the world it describes. The same mood prevails in the twin-poemed *Gymnopaidia* (1936).

Written between 1937 and 1940, *Logbook I* (1940) concludes with one of his best-known poems, "The King of



George Seferis, poet and diplomat

Asine". Characteristically, specific events are at most only alluded to, but an atmosphere of apprehension and anxiety about the looming menace of World War II permeates the collection. The drama of this war, its tragic consequences, and the internal politics of the Greek government-in-exile form the background to *Logbook II* (1944/45). Yet, even in this most diary-like of his collections, his poetry also goes beyond a situation in time. For example, while "Last Stop" focuses on the topical reality of wartime and "An Old Man on the River Bank" contains references to it, the former also involves profound, if depressing, musings on human psychology, and the latter a number of quintessentially Modernist themes: the poetic medium and the process of poetic creation, or the contrast between a more wholesome past and 20th-century life with its sense of nullity and lost signification. Above all, however, it is an agonizing cry of the heart for the need to find a way of preserving human qualities – man's humanism.

Logbook II was followed, in 1947, by the large-scale composition *Thrush* which draws on the Odysseus and Oedipus narratives and concludes with the poem's modern Odysseus experiencing a moment of transcendence or, in Seferis's words, "an affirmation of a moment of dazzling and eternal life". Another moment of visionary transcendence, during which love again has a central role, is the subject of "Engomi", which closes *Logbook III* (1955). The main bulk of the poems in this collection were written after Seferis's visit to Cyprus in 1953, a time when the Cypriot struggle for self-determination was rapidly moving towards a climax. They relate to the island's past and present, to its landscape and people. Rich in its appeal to the senses, *Logbook III* arguably contains the most extensive use of literary allusion by a poet in whose work a creative dialogue with the literary tradition, from Homer and the ancient tragedians down to contemporary poetry, is a constant and distinctive feature. This wealth of literary evocation is supplemented here by recourse to religious tradition and an intensified use of inherited popular culture. Myth is not abandoned, but poetic elaboration of historical themes is also introduced. Distilled from the island's reality (past and present) are those elements which at the same time transcend it, for they bear upon human experience more generally. Even in those poems relating to the Cyprus situation at the time the emphasis is still on the sense of belonging or its opposite ("Details on Cyprus" and "In the Kyrenia District", respectively), on the hubris of acting against nature ("Salamis in Cyprus"), and on the tribulation involved in the quest for ideals unrealized ("Helen").

The Three Secret Poems (1966) is the last collection to appear in Seferis's lifetime. Likewise exploiting literary, religious, and folk tradition, it is marked by references to accumulated experience, by allusions to his earlier poetry, and by a reflective mood. Concern with poetic practice emerges as a key theme. Others are the portrayal of a "ravaged" present and a vision of the end approaching, but also of a happier future for coming generations. They bear out the strongly held humanist belief, informing much of his poetry from at least *Mythistorema* onwards, that for all the bleakness of the present there is still hope and promise for mankind.

Seferis's first act of protest at the Greek coup d'état in 1967, and the censorship it imposed, was to refrain from publishing anything in his own country. Two years later he issued, through the BBC, his much-acclaimed "Declaration" against the Greek junta calling on the Colonels to restore democracy. Moreover, he produced two poems ("The Cats of Saint Nicholas" in 1969, and "On Aspalathoi..." in 1971) which, obliquely but unmistakably, warn of inherent dangers and condemn the political reality of the time.

Although three more collections came out posthumously, Seferis's poetic output remains relatively small in size. His oeuvre as a whole, however, was always considerably more extensive and proved to be dramatically so after his death. A novel, *Six Nights on the Acropolis*, begun in the later 1920s and reworked in 1954, appeared in 1974. Seven volumes of his private diaries and two of his political ones (covering the years 1926–60 and 1935–52 respectively) have been published to date as well as much of his vast correspondence. Fascinating in their own right, they add to our understanding of Seferis as man and poet, always open to stimuli from outside, yet deeply rooted in his own language, landscape, and tradition.

His concern with the Greek language, its limits and potentialities, lay behind his decision to translate a variety of texts into modern Greek. Conscious as he was of linguistic continuity, when rendering from an earlier form of the Greek language (passages from the Greek classics, the Revelation of St John, etc.) he insisted on the term "transcription" rather than "translation". In translating Eliot's *The Waste Land*, one of his many renderings of English and French texts into Greek, he prefaced it with an extensive introduction (1936). This was subsequently included in his essays (*Dokimes*), becoming the first of

several in which, with the sensibility of the practitioner, he examined the direction and complexities of contemporary poetic production, the nature of poetry, and its relation to language. Mostly Greek in their focus, his essays also cover a variety of topics as diverse as the *Homeric Hymns*, the Byzantine rock-cut churches of Cappadocia, and the *Memoirs* of general Makriyannis, *Erotokritos*, the poetry of Andreas Kalvos or Constantine Cavafy, and the painting of Theophilos Chatzimichail. For all their ostensible diversity, they constitute facets of Hellenism, a subject Seferis spent a lifetime exploring. Offering new insights and written in a style admirable for its clarity, precision, and economy, *Dokimes* form, with his poetry, a lasting legacy.

Biography

Born in Smyrna in 1900, Seferis moved with his family to Athens in 1914 where he completed his schooling. He studied law in Paris (1918–24) and then spent some months in London to improve his English. Entering the Greek diplomatic service in 1926, he spent most of his professional life outside Greece. His last appointment was as Greek Ambassador to London (1957–62). As a poet he attracted attention from an early stage. He won the Nobel Prize for Literature in 1963. He died in 1971.

Seleucids

Dynasty of Macedonian kings

The name Seleucids refers to the dynasty of Macedonian kings founded by Seleucus I Nicator (*c.*355–281BC), one of the successors of Alexander the Great. The dynasty dated its beginning to 312 BC (the start of the "Seleucid era") when Seleucus recaptured his original province of Babylon and started on a long career of expansion, during which he assumed the royal title in 305/04 BC. The dynasty lasted until 64 BC when it was overthrown by the Roman general Pompey, who created the Roman province of Syria. The name Seleucids is used by only one ancient author (Appian, *Syriake*, 48–50, 65, 67). More commonly the rulers are referred to in ancient writers from the 2nd century BC onwards as either "the kings descended from Seleucus Nicator", or most frequently as "the kings of Syria", the "Syrian kings", the "kings of the Syrians", but also as the "kings of Asia"; other designations are found as well. None of these territorial designations originates with the rulers, who never described themselves as kings of any particular country or people: the Seleucid empire thus never had a precise territorial definition. The Seleucids are also frequently referred to collectively as "the Macedonians".

Starting from his province of Babylonia, Seleucus I went on to enlarge his territories steadily, first towards the east and then towards the west. By the time of his death in 281 BC his empire extended from Bactria and the borders of India in the east to north Syria and the eastern Mediterranean, Asia Minor, and even a foothold on the European mainland across the straits. This large empire proved difficult to maintain as a unit, and subsequent rulers were frequently on the defensive against internal and external challenges. Under Antiochus III the Great the empire was able to stage a spectacular recovery, though Antiochus then clashed with the Romans and was defeated by them. The Treaty of Apamea that followed his defeat (188 BC) excluded the Seleucids from Asia Minor north of the Taurus and imposed heavy penalties on them. Of subsequent rulers the best known is Antiochus IV because of his attack on Egypt and rebuff by the Romans (168 BC), and especially because of his failed attempt in 167 BC to ban Judaism at Jerusalem. This is recounted at length in the Jewish tradition (Daniel, 1 and 2 Maccabees) on which Antiochus IV made a profound impact, but receives scant mention in the extant Classical sources

(Diodorus, 34. 1; Tacitus, *Histories*, 5. 8. 4–5). After his death in 164 BC the dynasty was increasingly prey to internal dynastic conflicts as well as external intervention. With the defeat and death of Antiochus VII in his Parthian expedition of 130–129 BC the dynasty ceased to play a significant role on the international scene.

The Seleucid contribution to the Hellenic tradition is not easily assessed. The court history that once existed is lost, and other contemporary accounts are incompletely preserved if at all; hence reliance must be placed on later and thus derivative writers, whose ultimate sources are largely unknown. Only two of these give a continuous, but sketchy, account of the history of the dynasty as a whole (Appian's *Syriake*, 2nd century AD; Justin's *Epitome* of the *Philippic Histories* of Trogus Pompeius, 3rd century AD). Whereas Alexander the Great attracted much attention under the Roman empire, the Seleucids were apparently largely neglected apart from their continued reputation in north Syria, especially at Antioch, and were often thought of as kings who had not stood up to Rome. Plutarch's general lack of sympathy for the kings after Alexander is also a relevant factor, as shown by his choice of biographies. The presentation of the Seleucids in the extant literary sources diverges. In one tradition, most clearly represented in the 4th century AD by Libanius of Antioch (*Antiochicus*, 11 especially 100–04; written in AD 360), Seleucus I in particular is presented encomiastically as having extended the Greek world in the east through his city foundations (notably Seleuceia on the Tigris, and the four cities of Antioch, Seleuceia in Pieria, Laodicea, and Apamea in north Syria). Among these, Antioch in particular continued to flourish after the end of the Seleucids as one of the leading cities of the eastern Roman empire. Other writers, dating from the 3rd century BC onwards (Phylarchus, later Posidonius), presented the dynasty negatively as an example of "oriental despotism" and "eastern decadence". This pejorative colouring was further emphasized by Roman propaganda at the time of the conflict with Antiochus III (cf. the speech of the Roman commander Manlius Vulso in 189 BC in Livy, 38. 17: "the Macedonians who hold Alexandria in Egypt, who dwell in Seleuceia and Babylonia and in other colonies scattered throughout the world, have degenerated into Syrians, Parthians, Egyptians"). The presentation in Justin's *Epitome* follows this predominantly negative view of post-Alexander history. In practice it is very unlikely that the Seleucids had any general programme of "Hellenizing" their empire; the action of Antiochus IV at Jerusalem seems to have been strictly local in character (despite 1 Maccabees 1.41), and was in any case soon rescinded. The aims of the kings were probably imperial and dynastic rather than specifically Hellenic. Modern approaches to the Seleucids have fluctuated. In the early 20th century they were presented as champions of Hellenism in the east (E.R. Bevan, A. Bouché-Leclercq, E. Meyer). After World War II Seleucid history was studied increasingly from an eastern perspective, and the Seleucids were presented as continuators of the Persian empire whose centre of gravity lay in Babylonia rather than in the west (P. Briant, A. Kuhrt and S. Sherwin-White), though the approach is controversial. The true identity and orientation of the Seleucids thus remain a matter of dispute.

Macedonian in origin but Greek in culture, the Seleucids used Greek as the language of the court. Their abundant coinage is purely Greek in style, types, and inscriptions, and makes no concession to the eastern world. On the other hand the Seleucids were able to identify at Babylon with native traditions of kingship, and there is much Babylonian evidence for their activity there, though unlike Alexander they made no attempt to connect themselves directly with Persian royal traditions. The Seleucid record in the patronage and promotion of Greek culture appears to be much more limited in all fields than that of the Ptolemies (their rivals) or of the Attalids, and there was no Seleucid equivalent in the cultural field to Ptolemaic Alexandria or Attalid Pergamum. No Seleucid ruler acquired the reputation of being a patron of the arts. This in itself may help to account for their more modest reputation in the general Hellenic tradition.

The last extended mention of the Seleucids in antiquity is in the *Chronography* of John Malalas (8. 197–213) in the 6th century AD; he is fullest on Seleucus I and his foundations, though the reliability of this work is often questionable and there are numerous gaps and confusions. The modern rediscovery starts with Erasmus Fröhlich's *Annales Compendiarii Regum et Rerum Syriae* (Vienna, 1744; 2nd edition 1754), though the stimulus for that was the Jewish tradition on Antiochus IV and the evidence of coinage, rather than the Seleucid reputation in Greek literary sources.

Seljuks

Turkish dynasty

The Seljuks were a Turkish dynasty that in the mid-11th century dominated the Caliphate at Baghdad to form what is now known as the Great Seljuk empire. While this empire, based in Mesopotamia, existed in one form or another till the end of the 12th century, a sibling state, the Seljuk Sultanate of Rum (the land of the "Romans", primarily discussed here), developed in Anatolia at the very end of the 11th century and was to remain an important factor in Byzantine and Crusader history till its demise at the beginning of the 14th century

Tradition has it that the primogenitor Seljuk was the leader of an Oghuz tribe that appears in history for the first time in the latter half of the 10th century in the region of the Caspian and Aral Seas. Seljuk (d. *c.*1000) was probably the first tribal leader to embrace Islam, ostensibly in its Sunni form.

The Seljuks were originally a nomadic and warrior-like Turkoman people amongst whom there was little political organization. This began to change during the 1020s when they made their presence felt as mercenaries for local warlords and became increasingly ambitious for territory. At the Battle of Dandanquan in 1040 Seljuk's grandsons, the brothers Chaghrï (d. 1058) and Tughrï I (d. 1063), captured Khorasan and effectively destroyed the power of the Turkoman empire of the Ghaznavids. By 1055 Tughrï I had captured Baghdad and was proclaimed sultan (or temporal ruler) by the Caliph, who was largely a religious rather than a political leader.

An influx of Turkoman tribes into Mesopotamia followed, and by the 1050s Turkoman raids were posing a threat to Byzantine possessions in eastern Anatolia where important towns such as Artze, Caesarea, Sebasteia, Ani, and Chonae had been sacked by 1070. Rivalries at home ensured that the Byzantines were unable to offer consolidated opposition. In 1071, at the Battle of Manzikert (Armenia), the emperor Romanos IV was defeated and captured by the Seljuks under the sultan Alp Arslan. The debacle of Romanos's capture, his release to collect a ransom, his deposition, and blinding created a military vacuum in Anatolia which the Turkoman troops of the Seljuks came to fill. Alp Arslan himself, however, was more concerned with establishing his position against fellow Muslims in Mesopotamia and Egypt rather than waging war on the empire.

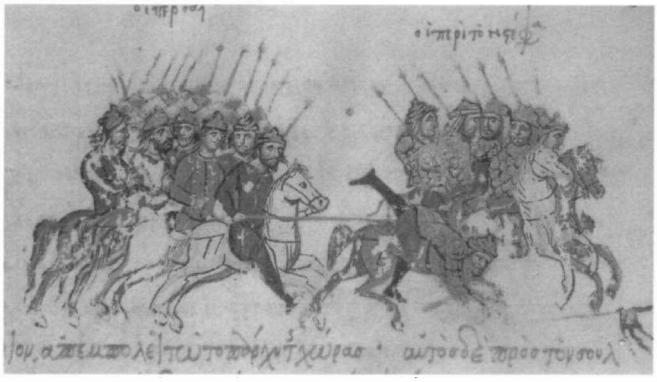
In 1072 the son of the now late Alp Arslan, sultan Malikshah, placed the prince Sulayman Ibn Kutlumush in charge of the Anatolian front. By 1081 Sulayman, who first styled himself sultan, managed to establish himself at Nicaea, some 160 km from Constantinople. In 1084 the important city of Antioch at the other extremity of Anatolia was also taken. Events in the east led to Sulayman's withdrawal from Anatolia, but his son Kilij Arslan I returned to establish himself at Nicaea in 1092. Although some fortified *kastra* were taken in Anatolia, it was in the rural areas that the Turkomans made themselves particularly felt.

Here a distinction has to be made. The embryonic Seljuk state that was developing in Nicaea and other towns regarded the Byzantine empire as an eternal entity: "Rome". Accommodation with Constantinople and the development of a stable state system were the keystones of official Seljuk policy. This sometimes clashed with the many independent-minded Turkoman soldiers-of-fortune (or *ghazi*) on whom the Seljuk state mostly relied. The *ghazi* were interested in booty and fired by Islamic notions of holy war. A third group can also be identified: Turkoman nomads, interested more in grazing lands rather than settled state systems or "holy war". The *ghazi* Turkomans were to prove both a bane and an ally for the Seljuks, and a constant nuisance to the Byzantines throughout the next two centuries. Some managed to establish a powerful state, the Danishmendid, which proved a formidable foe in later years to Greek, Latin, and Seljuk.

Political turmoil in Byzantium after 1070 led to a situation where Byzantine rebels increasingly made use of Turkoman mercenaries, including the armies of the Seljuks, to achieve their aims. In 1092 Alexios I Komnenos had made an agreement with the Nicaean Seljuks to assist him in attacking the *ghazis*. The same emperor, however, is alleged to have invited contingents from the West (which eventually took the form of the First Crusade) to assist him in removing the Turkomans from Asia Minor.

The Seljuks were forced out of Nicaea in 1097 by the First Crusade, but soon reorganized themselves at Iconium (Konya, south central Asia Minor) which became the capital of the Seljuk state. The activities of the crusaders and the Byzantines in Asia Minor had pushed Seljuks and Turkomans from the coasts, and thus the 12th-century Seljuk state was confined mostly to the interior. In 1116 the Seljuks were defeated at the Battle of Philomelion, and a period of relative peace followed between Konya and Constantinople. This was terminated by the Seljuks' defeat of the Byzantine emperor Manuel I at the Battle of Myriokephalon in 1176. Thereafter, turmoil in Asia Minor ensued with Seljuks, Byzantines, Armenians of Cilicia, Turkoman emirs, and crusaders fighting among themselves.

The creation of the Byzantine empire in exile at Nicaea following the capture of Constantinople by the Fourth Crusade



Seljuks: illustration from the 11th-century chronicle of Skylitzes showing a battle between Byzantine and Seljuk cavalry, Biblioteca Nacional, Madrid

in 1204 led, ironically, to a period of relative peace and prosperity for both the Byzantines and Konya. Indeed, the two states enjoyed almost intimate relations. In 1243, however, the Mongol hordes crushed the Seljuks at Köse Dagh, initiating a period of instability that the Seljuks would never fully recover from. In one form or another the sultanate existed till the beginning of the 14th century, when it disappears in obscurity.

The Seljuk state, which developed in virtual isolation from its parent Great Seljuk empire in Iraq-Iran, rapidly drew on Byzantine and Islamic-Persian traditions to establish a permanent state system. The Persian element was especially prevalent. Arabic was used only for Qur'anic and legal matters, and was virtually unknown by the majority of Seljuks. This led to the development of a very different type of Islamic state in Anatolia, one which had no Arab cultural base to speak of. This distinction assisted in the development of a uniquely "Turkish blend" of Islamic, Persian, and Byzantine traditions that would culminate in the Ottoman empire.

By the reign of Kilij-Arslan II (1155–92), an efficient administrative, military, and fiscal machine was perfected and the trappings of the sultanate were firmly established at court. The sultan, however, increasingly lost power to his ministers, especially after 1243, when the famous *pervane* (a sort of chief minister) Muin al Din Sylaman held the reins of power.

Art and letters at Konya from about 1150 up to 1243 were characterized by a strong Persian influence. There is no native Turkish literature from the Seljuk period. Writers, mystics, and artists from Mesopotamia increasingly came to Rum as Mongol pressure on Mesopotamia increased. The most famous was the poet and mystic Jalal al-Din Rumi (1207–73) whose followers developed the whirling Dervishes. (The revolt of the "false prophet" Baba Ishak *c.*1240, however, proved how great a danger these men could be to the state.) Mystic and spiritual traditions (notably Sufism) – sometimes with Shiite overtones – established themselves in Seljuk Anatolia prior to flourishing later in Ottoman times. The study of law was also encouraged, and some great Islamic jurists could be found in Konya. The institution of the *madrasa* (orthodox Sunni school of preparation for the "official classes") was found throughout the sultanate.

Seljuk architecture is justly singled out as an admirable development in that field, while the decorative arts involved mostly relief carving (some of it figural), tile and textile making, and some book illumination.

The Seljuks played an ambivalent role in the history of medieval Hellenism. Despite obvious tensions, the official state was not consistently hostile to the existence of the Byzantine empire and at times allied with it. Kilij Arslan II made a state visit to Constantinople in 1162. Seljuk troops often fought for Byzantium (even in Europe) and vice versa, especially against unruly *ghazis* and the crusader states. Relations were peaceful from 1211 to 1243, and many Seljuks fled to Nicaea in the wake of the Mongol attack. Some of these espoused Christianity and were resettled by the Byzantines. The so-called Gagauz, now living in Bulgaria, may have originally been Seljuk followers of the half-Greek sultan Izz a-Din (Kaykaus II, d. 1289) who was himself openly sympathetic to Christianity and had a Christian chancellor. Many Byzantine nobles, furthermore, served the sultan in many capacities, and many did not convert to Islam.

There is no doubt, however, that the demographic picture of Anatolia was slowly but irreversibly changed in the 12th and 13th centuries. Ecclesiastical administration simply collapsed in many provinces, cutting off a vital lifeline to the Byzantine world. Many people converted to Islam, some of them preferring this to the constant hardships under Christian rule. Islam, as a consequence, was a given fact in Anatolia by the time the Ottomans appeared and this made the eventual Islamization of the region easier than in the Balkans, where Islam for the most part was not adopted by the local Orthodox populations.

Summary

Originally a nomadic Turkoman people, the Seljuks dominated the Baghdad Caliphate in the mid-11th century and formed the Great Seljuk empire. This was a threat to Byzantine territory in eastern Anatolia and in 1071 the emperor Romanos IV was defeated by the Seljuks at Manzikert. By 1081 they had reached Nicaea but were pushed back by the Crusaders in the following decade. Centred on Konya, a Seljuk state flourished from the mid-12th to the mid-13th century when it was defeated by the Mongols.

Septuagint

The ancient Greek translation of the Old Testament

The translation of the Hebrew scriptures into Greek first occurred in Egypt. According to the *Letter of Aristeas*, the

pharaoh Ptolemy II Philadelphus (285–246 BC) wanted a translation for the library at Alexandria and sent a request to Jerusalem for translators. The chief priest responded by sending 72 scribes with Hebrew scrolls of the Pentateuch (the first five books of the Old Testament). On their arrival in Egypt they were housed on an island in the Nile where they worked. When completed, their version was approved by the synagogue at Alexandria, and a copy was delivered to Philadelphus. Somehow the original 72 scribes were slightly reduced to 70, and their translation acquired the name "Septuagint", which is Latin for 70; it is usually cited in biblical studies as the LXX, after the Roman numerals for 70.

At first (*c.*250 BC), the Septuagint included only the Pentateuch, but eventually, by *c.*130 BC, all the other Old Testament books had been translated, at different times and by a wide range of hands. This piecemeal translating into a developing Hellenistic Greek, mixed with many Hebraisms, produced translations that varied greatly in style and quality.

Additional Jewish works, probably written in Greek in the Hellenistic Jewish community of Egypt, were added to the Septuagint; they are known as the Old Testament Apocrypha. They were accepted as canonical by the early Church and included in the Septuagint; they were also included in the Latin Vulgate. During the Reformation, however, Protestants segregated the Apocrypha as uncanonical, and in the 19th century it was generally dropped from Protestant Bibles. It remains in Orthodox and Roman Catholic Bibles.

Translating from Semitic Hebrew into Hellenistic Koine Greek forced scholars to take account of the great philosophical critiques of the anthropomorphic Olympian gods. Consequently they frequently suppressed the overt anthropomorphism of the Hebrew stories in favour of the more abstract thought of the Greeks. This anti-anthropomorphism is apparent in many verses. For example, when Moses at the burning bush asks God for his name, the Hebrew says the "one who is present"; the Greek for "I am" becomes an abstract *en an* (the Being). Other Hellenistic thought patterns were also accommodated.

Widely used as the scriptures of the Greek-speaking Jews of the diaspora, the Septuagint soon became the first scriptures of the Church. The writers of the New Testament books drew from the Septuagint. Perhaps as much as 5 per cent of the New Testament is composed of direct quotations from the Old Testament. In addition, there are many allusions, indirect quotations, and paraphrases of the Old Testament in the New. Almost all of these references are drawn from the Septuagint; this is almost always the "scriptures" referred to in the New Testament. (The Nestle-Aland version prints the direct quotations in bold type in its critical apparatus.)

When debates developed between Jews and Christians over the truth of the Christian interpretations of the Septuagint, the Jews argued that the Christians were quoting from translations; the Christians responded that the Septuagint was a Jewish translation. These debates led at first to new Jewish translations into Greek from Hebrew sources. Finally, after the destruction of Jerusalem in AD 70, the reorganization of Judaism under the rabbis involved the abandonment of all versions of the Old Testament except for the Hebrew one.

In order to make the Hebrew scriptures the sole authority for Jews, rabbinic Judaism found it necessary to establish one final version from the various Hebrew ones. Eventually the stabilized Hebrew text was known as the Masoretic text (MT). Meanwhile, in general, synagogues continued to use bulky scrolls for the individual books. Christians abandoned scrolls for the more convenient and "modern" form of the codex, which pulled the books together into a single volume. The books in the Hebrew scriptures soon differed in order of arrangement from that in the Septuagint. The Hebrew scriptures were grouped into the law, the prophets, and the writings; the Septuagint was arranged as law, histories, poetry, and prophets, with the Apocryphal books scattered among the latter three groups according to their character.

The discovery of the Dead Sea Scrolls at Qumram from 1947 has revealed that earlier Hebrew text families underlie both the Masoretic Hebrew text and the Septuagint. This has meant that the Septuagint can now be viewed as equal, superior, or inferior to the Masoretic text depending on the books in question. In addition, the discoveries of fragments of the Septuagint have now pushed scholarship back close to the original. It should also be noted that the Septuagint is currently the only source for understanding a number of obscure Hebrew words. Modern study of the Septuagint is now being aided by the use of computers for textual analysis. Major centres of study are in Germany, Finland, France, and Spain.

The value of the Septuagint has been immense. From the beginning the Septuagint has been the official version of the Old Testament for the Greek Orthodox Church. It paved the way for Christian missionaries. And it was the basis for the translations into Armenian, Georgian, Coptic, and other languages.

Summary

The Septuagint is a translation of the Hebrew scriptures into Greek made at the request of Ptolemy II Philadelphus (285–246 BC). A monument of Hellenistic Greek, it is the oldest and most influential of the ancient translations of the Old Testament. It has always been the standard text of the Old Testament for the Greek Orthodox Church.

Serbia

The boundaries of Serbia have altered during the 14 centuries since the first arrival of Serbs in the Balkan peninsula. The emperor Herakleios (610–41) is supposed to have granted them territory in the northwest Balkans, and also to have settled some Serbians in the north of Greece at Servia, but both grants of territory may be legal fictions. For a long time contacts between Serbia and Greece were limited owing to the presence of the intervening Bulgarian empire. In the 9th century the Serbs were converted to Christianity, adopted the Cyrillic alphabet, and entered the world of Orthodoxy if not of the empire. The emperor Constantine VII Porphyrogennetos (913–59) wrote a good deal about the Serbs in *De Adminstrando Imperio*. Basil II's defeat of the Bulgarians brought the Serbians in Raška and Dioclea under Byzantine control, and the Komnenoi were keenly interested in the Serbians as potential allies or enemies in the face of invasions from Italy or against it. Crusading armies, entering the Byzantine empire at Belgrade, found some kind of Byzantine presence there, but northern Serbia was largely uninhabited and Byzantine control really began at Niš.

After the Fourth Crusade the situation changed. The Nemanjid dynasty steadily extended their power southwards at the expense of Byzantium. They built Byzantine churches and married Byzantine princesses. In return Byzantine chroniclers like Gregoras and Pachymeres commented on the uncouth manners and crude dwellings of the Serbs. Stephan IV Dushan (1331–55) called himself emperor of the Greeks as well as the Serbs and wished to become emperor at Constantinople. He also occupied northern Greece, but on the collapse of his empire Serbs appear to have made little impression in this area, although there were briefly petty Serbian dynasties in Thessaly and Epirus.

The Ottoman invasion again drove a wedge between Serbia and Greece. Each nation fell to the Turks in a catastrophic way, celebrated thereafter in song. The Greeks gave no help to the Serbs at the battle of Kosovo in 1389, the Serbs no help to the Greeks at the siege of Constantinople in 1453. In between these two events, Greeks and Serbs helped the Turks at the battle of Ankara in 1402. While history linked and divided Greeks and Serbs in this way, legend provided more glorious links with each nation carrying with it during years of subservience memories of a heroic defeat, a martyred ruler, and hopes of an eventual triumph.

The Serbs had established an autocephalous Church as early as 1219. A patriarchate at Peć was founded in 1346, but met with opposition from the Greeks. In the early part of the period of Ottoman domination it was Turkish policy to manage ecclesiastical affairs through Greek control, but an independent patriarchate at Peć was re-established from 1557 to 1766. Even outside these years Greek religious influence was never very strong except perhaps in the south, and Greek efforts to set up schools in Serbia were equally unsuccessful. Where Greeks did achieve success and influence was through trade. Greek and Vlach merchants travelling through Serbia to the markets of the Habsburg empire set up warehouses and trading posts in Serbia, sometimes settling to build houses and churches. At one time, Belgrade almost looked like a Greek city. It contained a flourishing Greek school for which Serb government funds were allocated in the 1840s, although it became a private school in 1847. Strong family ties kept Greek merchants in touch with their native villages, to which they often returned, bringing part of their wealth with them. Those who stayed behind in Serbia were eventually assimilated, although they contributed to a feeling of friendship between their adopted country and Greece. There was some contact between the Greek revolutionaries who sought independence from Turkey and those who fought for the same cause in Serbia. Iordakis, also known as Olympiotis, had fought in Serbia and with the Russians before taking part in the abortive rising of 1821 in Romania. Milos Obrenovic, however, adopted a rather pacific role around 1830.

When in 1913 Serbia was awarded the territory now known as the Former Yugoslav Republic of Macedonia, it found substantial quantities of Greeks in towns like Titov Veles, Bitola, and Strumica. Many of these Greeks were in fact Vlachs, harbouring pro-Greek sentiments. It is impossible to find such Greeks any longer, as they have either left or been assimilated. Occasionally a building or an old family name is a reminder of the Greek past, although this past is not remote, going back no further than the mercantile expansion of the 18th and 19th centuries.

After World War II a new kind of emigrant entered Serbia in the shape of fighters for the Communist side in the Greek Civil War, but many of these were sent to other Communist countries or were already Slavophones, and the only real Greek-speakers in Yugoslavia after the war were a few elderly Hellenized Vlachs. The emergence of Macedonia as an independent state between Serbia and Greece has made communi-

cation between the two countries difficult, although Macedonia like Bulgaria and Turkey has served as a common enemy to link Serbs and Greeks.

Serbs

The origin of the Serbs is obscure. It has always been suggested that like both the Bulgars and the Avars they and the Croats were originally of non-Indo-European stock, dominating a subservient Slav population. Alternatively, though they are apparently quintessentially Slav with their Orthodox religion, Cyrillic alphabet, and attachment to Russia, it has been suggested that most Serbs like Vlachs and Albanians are the descendants of the indigenous Illyrian tribes. In the 7th century Serbs are said to have moved from Czechoslovakia to modern Serbia. They are thought to have acknowledged the authority of the Byzantine emperor in the time of Herakleios (610–41), although such authority, if it existed, must have been both nominal and ephemeral. The rise of a powerful Bulgarian kingdom acted as a barrier between Serbia and Byzantium in the early Middle Ages. It is a recurring feature of the relationship between Greeks and Serbs that, through not clashing with each other and clashing instead with the intervening Bulgars, they have been generally on friendly terms with each other.

The Serbs were originally pagans, organized as extended families or *zadrugas*, then as clans, then as tribes. In the middle of the 9th century these tribes were united under one župan (governor), and Cyril (St Constantine) and Methodios introduced Christianity and the Cyrillic alphabet. After the final defeat of the Bulgarians in 1018 the Byzantine empire controlled the Balkan peninsula, and the Serbs once again acknowledged Byzantine rule, although again this rule cannot have been too strictly enforced, especially after the defeat of Manzikert and the arrival of the Crusaders when the empire had trouble on other fronts. The main area of Serb strength was in Dioclea or Zeta, roughly corresponding to modern Montenegro, and Raška, roughly corresponding to the southern part of Serbia and the northern part of Kosovo. Interestingly and tragically, neither area has been the hub of the modern Serbian state.

In 1167 Stephan Nemanja became župan of Raška. The Nemanjis were to dominate Serbian history for the next 200 years. They soon obtained independence from Byzantium after the death of Manuel I Komnenos, and gradually extended their power southwards and northwards until in the reign of Stephan IV Dushan (1331–55) Serbs ruled from the Danube to

the Gulf of Corinth. The Nemanjids were bloodthirsty but pious. It was rare for rulers to suceed to the throne without slaugther of rival claimants or their predecessors. Yet they were builders of beautiful churches, modelled on Byzantine architecture. St Sava, the son of Stephan Nemanja, was a man of conspicuous piety who established an autocephalous Serbian Church. The Byzantines despised the Serbs as rude barbarians, but for political reasons Byzantine princesses often married into the Serbian royal family, and Dushan aspired to become emperor at Constantinople.

On Dushan's death his ramshackle empire fell to pieces. Serbian princelings ruled for a time in Thessaly, Epirus, and Macedonia, but the Ottoman advance soon put an end to them. Further north, Serbian resistance coalesced under prince Lazar with his capital at Kruševac. On 15 June 1389 the Serbs fought the Turks on the Field of Blackbirds in the plain of Kosovo. In Serbian oral poetry, often compared to the work of Homer, this battle is celebrated as a heroic defeat for the Serbs. prince Lazar certainly died. In the west bells were rung for a glorious victory. The sultan was certainly slain. Probably the battle was indecisive. In Serbia prince Lazar's son Stephan and great nephew George Branković continued to have a certain degree of autonomy, but both were forced to help the Turks in their campaigns. In 1459 the Ottomans captured the Serb capital of Smedrevo and ruled Serbia for the next 350 years.

This period was not one of complete stagnation. The Serbian Church was a focus for national feeling. Between 1557 and 1776 there was an independent patriarchate at Peć; before and after these dates Greek influence was strong in the Church. Patriarch Jovan II led a revolt known as the insurrection of St Sava between 1593 and 1609.

In 1691 patriarch Arsenye III led a great emigration of about 30,000 families to the north of the Danube away from the traditional homelands of the Serbs. This was an important if eventually tragic move as it meant that Serbia had a less good claim to areas like Kosovo and Macedonia, and it involved Serbia in a difficult relationship with Austro-Hungary. Serbs in the Voivodina, north of the Danube, were in the 18th century at the forefront of the movement for Serb emancipation, but the Catholic Habsburg empire which briefly occupied Belgrade was not always on good terms with its Orthodox Serb subjects.

In 1804, under the leadership of Kara George, the Serbs revolted against the Turks. This revolt has little to do with similar movements in Greece for independence. Kara George, an illiterate dealer in pigs, has not much in common with lofty idealists like Rigas Pheraios. One of the reasons for discontent was the rapacity of the Greek clergy, dominant since the abolition of the patriarchate of Peć in 1766. Kara George's rebellion failed, but in 1817 Serbia gained a limited form of independence for a small area south of Belgrade. For the next 100 years the Karageorgevic and Obrenovic dynasties were to reign over Serbia in uneasy succession, with no fewer than four rulers meeting untimely deaths.

Milos Obrenovic, who reigned from 1817 to 1839 and then again from 1869 to 1870, did much for the organization of the state. In education he took a strongly nationalistic line. The Serbian language was standardized by the great scholar of the Kosovo epic, Vuk Karadžić. The influence of Serbs in the Voivodina was also marked. Although ancient Greek was part of the curriculum, little help was sought from Greece, although the two countries, recently liberated from the Turk, and proud of their ancient traditions, had much in common. Closer links and also rivalries were established in the latter half of the 19th century when Serbia, Greece, and Bulgaria all became claimants to what remained of the Turkish empire, an area ruled in the past by all these countries. Linguistic claims were equally difficult to determine since, in addition to Albanians, Vlachs, and Turks complicating the issue, the central district under dispute was inhabited by people who spoke a language somewhere between Bulgarian and Serbian, although closer to the former. Bulgaria was indeed awarded this land at the Treaty of San Stefano, but the Treaty of Berlin reversed this decision and left Macedonia in the hands of the Turks. Serbia made some gains around Niš.

In the Balkan Wars of 1912 and 1913 the Serbs and the Greeks were on the winning side, and thus able to divide the bulk of Macedonia between them. The Serbian gains, known as south Serbia, became an integral part of Yugoslavia, and only Serbo-Croat was taught in the schools. Relations with Greece were generally friendly, although there was some tension about Serbian access to a free port at Thessalonica. The Greeks and Serbs had been somewhat uneasy allies during World War I when after a gallant resistance the Serbian army retreated through Albania to Corfu and joined the Allied front at Thessalonica. During World War II the two countries were again briefly allied when in 1941 the German armies drove through Serbia on their way to Greece.

Resistance in Greece and Yugoslavia followed a similar pattern with a right-wing faction supporting the monarchy pitted against a communist faction, both officially fighting the Germans, but sometimes fighting each other. The result of this struggle was, however, different. Yugoslav support for the communists in the Greek Civil War led to much tension between the countries. Tito's break with Russia eased this tension, but his recognition of Macedonia inflamed Greek nationalist feelings. The disintegration of Yugoslavia increased the pressure with an independent state under the name of Macedonia being anathema to the Greeks. Paradoxically Serbs, now dominant in the rump of Yugoslavia, although ruled by a communist and repressive regime, became oddly popular in Greece as a beleaguered Orthodox nation, facing dangers from unreliable Macedonia, Muslim Albanians in Kosovo, Catholic and German-backed Croatia, and a host of other enemies.

Summary

Originally pagans, the Serbs became Christian and literate in the 9th century. From 1167 to 1355 the Nemanjids dominated Serbia and ruled an empire that eventually reached from the Danube to the gulf of Corinth. Under the Turks the Serbian Church maintained national feeling. Limited independence was gained in 1817.

Serres

City in Macedonia

With a population of 50,390 according to the 1991 census, Serres is one of the most populous towns of Greek Macedonia, the second largest in east Macedonia after Kavalla, and capital of the administrative department of the same name. The town's position remains the same as when it was first recorded in antiquity; it occupies the southern slopes of Mount Menoikion, while a vast plain extends to the west and south. Not far from the town, at a distance of about 12 km, flows the Strymon river, a dominant feature of the region. Serres lay close to the Via Egnatia, one of the most important land routes in Roman, Byzantine, and Ottoman times, which linked Thessalonica to Constantinople (modern Istanbul). The development of Serres was much affected by its proximity to that major route.

The first record of the town is connected with events of the 4th century BC. It was probably founded by the Thracian tribe of Odomantes under the name of Sira or Siris, which was later transformed in Serrai/es (the Ottoman Turks knew it as Siroz). Originally a Thracian settlement, it was open to the influences of Hellenic civilization that came from the Greek colonies on the east Macedonian coast. The process of Hellenization was accelerated and finally completed after the region was annexed to the Macedonian state by Philip II between the years 358 and 355 BC. From 146 BC onwards the region of Serres was incorporated in the Roman province of Macedonia. Christianity was introduced to the region by St Paul, who visited the nearby towns of Philippi and Amphipolis and established a Christian church there. In late antiquity the bishop of Serres was a subordinate of the metropolitan of Thessalonica.

Little is known about Serres in the 7th and 8th centuries AD. The collapse of Byzantine authority in most of the Balkans during that period affected eastern Macedonia as well. The Slavic tribes of Strymonitai and Ryghinoi who settled in this region lived an independent existence and were often hostile to Byzantium. However, the Byzantine emperors were keen to re-establish control of the routes between Constantinople and Thessalonica and they seem to have taken some measures in that direction. There is evidence of a campaign by Constantine IV (668–85) against the Ryghinoi Slavs; and Justinian II (565–78) is said to have settled a garrison of Scythian mercenaries at the Strymon defiles, northwest of Serres. Whether Serres continued to be a centre of organized urban life during that period, and what role it might have played in those events, is not known. Byzantine authority was definitely re-established there in the 9th century. Serres too re-emerged from obscurity. By the late 9th century the region of eastern Macedonia was organized into the Byzantine province (theme) of Strymon with Serres as its capital. The rest of the Middle Ages saw Serres as the most important administrative and economic centre in eastern Macedonia, a position which it retained in modern times as well, despite the serious damage it suffered during a Bulgarian raid in the early 13th century from which it quickly recovered. The church of Serres re-emerged in the early 10th century as a separate archbishopric and was later in the same century elevated to a metropolitan see. The town was under Byzantine rule for most of the Middle Ages. The Franks were established there in the aftermath of the Fourth Crusade (1204), to be followed by the Epirot Greeks and then the Bulgarians, until the Byzantines retook the land *c.*1242. The Serbs came a century later and occupied the town in 1345, as a result of their involvement in the Byzantine civil war between the regency of John V Palaiologos and John Kantakouzenos. Serres held an important position in the administration of the short-lived empire of Stephan IV Dushan. The latter's death and the subsequent disintegration of his empire were followed by the establishment of a semi-independent Graeco-Serbian principality centred at Serres, which was first governed by Dushan's widow Elisabeth, then by John Ugljesa until 1371. The years between 1371 and 1383 were the last period of Byzantine rule in Serres; the town fell to the Ottoman Turks on 19 September 1383 and so began the Ottoman period of the town's history which lasted for more than five centuries.

The late medieval and early modern years are a well-documented period for the social and economic life of the town. A wealth of documents from the archives of the Athonite monasteries, which owned a great deal of land in the surrounding region, and from the local monastery of St John Prodromos on Mount Menoikion, which prospered during the 14th century, show that the fertile and well-irrigated plain of southeastern Macedonia was populous and productive enough to create the conditions for the town's development. More about the population and economy of the town itself can be found in the Ottoman fiscal registers of the 15th century.

Agricultural activities in the region were oriented towards cereal cropping and viticulture. The cultivation of textile substances, mainly flax, had a less important role to play and, it seems, was limited to serving local demands, while cotton was only a marginal product in those years. Mining was another significant economic activity of this region with iron being extracted from the (now worked-out) mines of Siderokastro, Vrontou, and Trilision. Serres was the marketplace of the region and also a centre of handicrafts. Merchants and artisans were organized in corporations (guilds) and were able in the course of the 14th century to influence local government. The opposition which the town of Serres raised against the party of John VI Kantakouzenos (who was himself a wealthy landowner in that region), during the Byzantine civil war of the 1340s, was probably a reflection of the anti-aristocratic tendencies of the local mercantile and artisan classes.

The earliest figures for the town's population are derived from the Ottoman fiscal registers of the 15th century: about 6200 people are recorded in Serres in 1454/55 (3450 Christian and 2750 Muslim), and about 4896 in 1478/79 (1706 Christian and 3190 Muslim). The Muslims were introduced into the town straight after the Ottoman conquest, and soon made up a large proportion, often becoming the majority, of the population, as is shown by these figures. They were in part immigrants from Anatolia, in part the product of Islamization.

The emergence of this new element of the population was accompanied by the topographic expansion of Serres, as they established their own quarters outside the old fortified section of the town. This provides good evidence of a voluntary surrender of the town to the Ottomans, because it was against their usual practices to allow the Christian population of places taken by force to remain in the fortified sections; the same can be deduced from the fact that the cathedral church of the town, the church of St Theodore, remained in Christian hands after the Ottoman occupation. The majority of the Christians of the town were ethnically Greek (the early 17th-century chronicle of Papasynadinos is a characteristic text in the local Greek dialect), while the population of the surrounding countryside was mixed, Greek and Slavic. Another ethnic element present in Serres were the Sephardic Jews who were settled there at the end of the 15th century. In 1519 the population of Serres consisted of approximately 6847 people (3157 Christian, 3420 Muslim, and 270 Jewish). Sephardic Jews were settled in other towns of Macedonia as well (about 120 persons are recorded in Giannitsa for the same year), but the largest group of them was to be found in Thessalonica where they numbered 15,715 in 1519.

The following centuries were marked by new developments in the economy of the region. The establishment of large private estates (*çiftliks*) in the 18th century was accompanied by the commercialization of agriculture. As a result, the cultivation of highly commercial products, such as cotton and tobacco, which was strongly favoured by the abundance of water and the quality of the soil in this region, soon gained ground and became the most profitable agricultural activity.

The Ottoman conquest of the land in the late 14th century had brought about the collapse of the local Christian landowning nobility, which was not to reemerge again. During the long period of Ottoman rule the rural estates were in the hands of either Muslim individuals or pious foundations (*waqf*). Nevertheless, several members of the Greek community did make their fortunes through trading. The good economic standing of many local Greeks, as well as contact with central and western Europe, brought a revival of intellectual life to the town. Efforts to promote a form of Greek education in Serres were made throughout the centuries of Ottoman rule (this is indicated even in the early 17th-century chronicle of Papasynadinos), but the earliest known Greek school at Serres was founded by the metropolitan Gabriel in 1735 and was subsidized by many wealthy Serrean merchants. Throughout the 18th century the influence of the ideas of the Enlightenment gave rise to Greek national sentiment. Many prominent members of the Greek community joined the *Philiki Hetaireia* ("Friendly Society"), including the metropolitan Chrysanthos and the rich merchant Emmanuel Papas (1772–1821). The Greek people of Serres remained inactive during the War of Independence, the main reason for this being the large number of Muslims in the town and their readiness to deal ruthlessly with any revolutionary action. Nevertheless, several Serrean individuals either supported the Greek forces or took part in the fighting. Most prominent among them was Emmanuel Papas who organized and led the unsuccessful uprising in Chalcidice between May and November 1821.

Ottoman rule in Serres lasted until the Balkan Wars. The Bulgarian army occupied the town on 25 November 1912 and held it until the 28 June 1913 when it was driven out by Greek forces, after the former members of the anti-Turkish alliance came to blows. The region of Serres and the rest of southeastern Macedonia were officially assigned to Greece by the Treaty of Bucharest (1913) which ended the Balkan Wars. Yet the town of Serres and the surrounding region were occupied twice again by the Bulgarian army during World Wars I and II.

The history of Serres in the 20th century is marked by significant changes in its demographic and economic conditions. First, the Muslims of the region departed as a result of the 1923 exchange of populations between Greece and Turkey and were replaced by Greek refugees from Anatolia. Then the large number of newcomers, the distribution of land to every individual peasant, the expansion of arable land by drainage, and the introduction of modern agricultural techniques resulted in an unprecedented increase in agricultural production (which continues with the cotton and tobacco crops). Contemporary Serres is a large provincial town with a lively economy based on the agricultural production of the surrounding region, commerce, and services.

Sèvres, Treaty of 1920

Treaty of the Allied Powers with Turkey

The Treaty of Sèvres was the last of four treaties ancillary to Versailles that imposed terms on Germany's defeated allies in World War I, after St Germain (Austria), Neuilly (Bulgaria), and Trianon (Hungary). Presented to the Ottoman government on 11 May and signed at Sèvres on 10 August 1920, the settlement was never enforced and was ultimately replaced by the Treaty of Lausanne (1923).

The treaty confined the Turkish state to a part of Asia Minor. The sultan's government was allowed to continue at Constantinople, but the city was included with the Dardanelles, the Sea of Marmara, the Bosporus, and adjacent lands in a Zone of the Straits. This zone was placed under the administration of an international commission, so as to ensure access "to every vessel of commerce or war without distinction of flag". Kurdistan was given local autonomy, with the right to secede within a year. Armenia was made an independent state with boundaries drawn by president Wilson to include Trebizond, Erzurum, and Van. Syria, Mesopotamia, and Palestine were granted independence subject to mandatory powers appointed by the League of Nations. Turkey renounced all claims to the Hejaz, Egypt, Sudan, and Libya, and recognized the French protectorate over Tunis and Morocco, the British protectorate over Egypt, the British occupation of Cyprus, and Italian control of the Dodecanese. The finances of the Turkish state were placed under the control of a financial commission appointed by the Allied Powers. The capitulations affording extraterritorial status to non-Turkish nationals were extended to all the Allied Powers. Also stipulated were the protection of minorities, disarmament of the Turkish military, and the prosecution of war criminals.

The terms of the treaty were particularly favourable to Greece. The exercise of Turkish sovereignty in Smyrna and a large surrounding region was delegated to Greece, with the prospect of annexation to Greece after a plebiscite in five years. The islands of Imbros and Tenedos and the whole of European Turkey outside the Zone of the Straits were ceded to Greece, while Greek possession of other Aegean islands was confirmed.

Five other agreements were signed at Sèvres on the same day. Greece and Armenia both signed treaties for the protection of minorities within their borders. A tripartite pact between Britain, France, and Italy recognized their respective zones of influence within Turkey. Italy agreed to cede the Dodecanese, excepting Rhodes, to Greece. But the only enduring geographical outcome of Sèvres was the transfer of western Thrace from Bulgaria to Greece by a treaty between Greece and the Great Powers.

The treaty of Sèvres proved unworkable. The Greek military presence in the Smyrna region which it codified provoked a resurgence of Turkish power. The Allied signatories were divided among themselves, leaving the Greeks alone to enforce the treaty. But perhaps decisive to its failure was its identification with the political fortunes of the Greek prime minister, Eleftherios Venizelos.

The treaty was signed almost two years after the Turkish surrender. This delay resulted from British resistance to French claims in Syria and Cilicia, Wilson's temporizing over proposed American mandates for Armenia and the Straits, and from consequences of the Greek landing at Smyrna on 15 May 1919. The Greek presence gave coherence to what had heretofore been desultory Turkish resistance to Allied occupation; the British high commissioner commented that "the Greek occupation of Smyrna has stimulated a Turkish patriotism probably more real than any the war was able to evoke." In the summer of 1919 Mustafa Kemal, appointed inspector of the eastern provinces by the Sublime Porte, emerged as the leader of a Turkish nationalist movement. Already a year before Sèvres the National Pact formulated at Erzurum and Sivas defied Allied pretensions in Asia Minor. The Allied occupation of Constantinople on 16 March 1920 led Kemal's Grand National Assembly to denounce the sultan's regime, and swelled the ranks of the nationalist army, already victorious over the French at Marash. The signature of Riza Tevfik, the Ottoman legate at Sèvres, was more representative of an Allied protectorate than of the Turkish nation.

The Greek position at Smyrna and the emergence of Kemal exacerbated differences among the Allies. At the Paris peace conference the Italians, with their interests in the Adalia (Attalia) region, opposed Greek claims in Asia Minor – the Smyrna landing itself was dictated more by Lloyd George's and Wilson's pique over Italian claims than by a concerted strategy. On 13 March 1921 count Sforza signed an accord with the Nationalists pledging opposition to the Sèvres awards to Greece in Thrace and Asia Minor. The report of the Interallied Commission of October 1920 investigating atrocities in the Smyrna region led the French prime minister to criticize the Greek presence. Economic interests disposed France to make a separate peace with Kemal; the Franklin–Bouillon accord ceded Cilicia to Turkey while protecting the French position in Syria. Nor would the British government fight to uphold the Treaty of Sèvres. Although Lloyd George saw the greater Greece it stipulated as a prop to British interests in the eastern Mediterranean, his cabinet was divided – Churchill urged a return to the traditional policy of supporting Turkey against Russia. Venizelos secretly hoped for a Turkish rejection of the Sèvres terms that might force Britain into a larger war, but assured Lloyd George that Greece could enforce the treaty without allied armies.

The Treaty of Sèvres reflected the Allies' desire to support the political position of Venizelos, whom the Entente had installed as prime minister by overthrowing the neutralist king Constantine in June 1917. Venizelos hoped that gains in Asia Minor and Thrace might mitigate popular discontent over his use of foreign intervention against his political opponents, since acquisitions in Epirus and Macedonia had won him popularity after the Balkan Wars. When Venizelos lost the elections of November 1920, the Allies placed an embargo on economic credits to the new government, and by April of the next year they declared neutrality in the Greek–Turkish conflict. Kemal's forces drew the Greeks into the interior, routed them at Sakarya in August 1921, and one year later drove them from Smyrna. In November 1922 Venizelos was at Lausanne negotiating recognition of Kemal's Turkey, while six of his political enemies – including the prime minister, Gounaris – were executed in Athens.

The Treaty of Sèvres was intrinsically untenable. Marshal Foch's commission had estimated that 27 divisions would be necessary to enforce its terms – the Greeks had 6. "To maintain M. Venizelos in power in Greece for what cannot in the nature of things be more than a few years at the outside", the British adviser de Robeck observed, the Allies were "prepared to perpetuate bloodshed indefinitely" and to violate their own principle of self-determination. The census of the ecumenical patriarchate of 1912 (taken before the arrival of thousands of Turkish refugees from the Balkan Wars) had found Greeks a minority on the mainland; the Interallied Commission of 1919 found Greeks a minority everywhere but Smyrna and Aivali. In rejecting the prime minister Gounaris's request to lead the Asia

Minor campaign general Metaxas commented that "we are an ethnological minority even in the area round Smyrna". But more importantly, he recognized, the Turks had developed a national feeling.

Greece and Turkey are the only two countries to have waged their respective wars of independence against one another. As Toynbee observes, the Greek war of 1821 had been the first thoroughgoing application of the Western national idea in Ottoman lands; the Turkish war against the terms of Sèvres a century later was fought for the same principles. The Treaty of Sèvres was the apex of the recrudescence of the Great Idea – the dream of a restoration of Greek hegemony in the heartland of Byzantium. This aspiration, spawned by the romantic nationalism of the French Revolution, corresponded little to the reality that inspired it. In its polyethnic character and the liberty afforded to local administrative, social, and economic structures Byzantium had more in common with the Ottoman regime than with modern Greece. In addressing the Paris peace conference Venizelos used maps showing the historic persistence of Greek settlement in Asia Minor to argue for the introduction of a national regime of a kind the region had never known. His attempt to extend the modern Greek state into Asia Minor fostered a Turkish leviathan. For the Turkish state *Sèvres fobisi* – fear of Sèvres – remains an abiding anxiety. For Greeks the treaty of Sèvres represents the phantom culmination of a century of territorial expansion, precipitating the catastrophe of 1922 and foreshadowing that of 1974.

Ships and shipping

The Greeks of antiquity lived mostly near the sea; the fact and its significance were not ignored (Aristotle, *Politics*, 1271b34). The influences that formed their culture were seaborne as was its own diffusion; their literature from its earliest pages has references to the sea, to ships, and cargoes. The Greeks of the Middle Ages have been described as suspicious of the sea and of commerce. Nevertheless a Byzantine of the 14th century reportedly considered that his city should become a purely maritime commercial power (John Kantakouzenos, *Histories*, 2. 537). In the contemporary world merchant shipping is one (perhaps the only) commercial activity in which Greece is internationally prominent. The Greek-owned merchant fleet is now the largest on earth; members of a nation accounting for about 0.2 per cent of the world population apparently control about 15 per cent of its maritime carrying capacity.

Such facts create an understandable temptation to see a continuity of maritime genius and to stress its importance in the history of the Greeks. To this some writers have succumbed despite difficulties that should encourage resistance. A number of centuries before the 18th are an almost complete blank. From other facts (these include the Italian basis of the modern Greek maritime argot, the very unsettled conditions in the Aegean during part of the period, the feeble representation of maritime Greeks in surviving commercial documents of late Byzantine times, the known maritime strength of other nations, and the beginnings, so far as documented, of the maritime adventure of the 18th century) it may be suspected that the blank reflects reality rather than lack of evidence or diligence in collecting it. In addition it is not only difficult to assess the importance of shipping but the approach to the difficulty must differ for different ages. Antiquity, therefore, and the modern period will be described separately. Between them there will be an intermission of about a thousand years.

The physical characteristics of ancient ships may be inferred from surviving descriptions, depictions, and wrecks. By the 5th century BC merchantmen and warships were clearly distinguished. The former were known as "round ships" (*strongyla ploia*) or *holkades* or (in the Phoenician context) *gauloi*, the latter simply as ships (*nees*) or long ships (*nees makrai*) or with reference to a specific type *pentekontoroi* (ship with 50 oars) or *triereis* (trireme). The distinction was not only in beam but also the principal means of propulsion, which for merchantmen was sail and for warships, at least in battle, oars. Use of pentekonters by the Phocaeans on their journeys to the west seemed to the 5th century remarkable (Herodotus, 1. 163) and reference to oared merchantmen (Thucydides, 4. 118. 5) is extremely unusual. The date of this functional specialization between speed and capacity is obscure. The earliest surviving picture of a round ship on a pot is from the late 6th century BC (British Museum, London); if the surprise of Herodotus was shared by contemporaries of the events, then round ships should have existed by its earlier years.

The construction of Mediterranean ships, as appears from their wrecks, had certain common features between the late Bronze Age and the end of antiquity. The hull planking is held together by mortice and tenon joints locked with tree nails. In construction the shell would have been built first and the frames added afterwards. The advantage of this method is a

Ships: Kavalla in Macedonia is a major port and entrepôt for the export of tobacco

very firm hull. Its disadvantage is the skill and time required for the adzing and jointing of the timbers. It seems to have given way to skeleton-based construction (in which the integrity of the hull depends on fixing its planking to the frames) by the 7th century AD, Oak was used for the keel and frequently the frames, fir or pine for the hull planking. Hulls were caulked and often sheathed in metal, lead being found more than copper.

Most merchantmen were single masted with a single square (strictly, rectangular) sail. The sail's angle to the mast could be adjusted and it could be flexibly brailed. Some later ships also had a foremast with a smaller sail. Three-masted vessels must have been very rare. Rudders were oar-shaped and projected astern from one or both sides of the hull.

The capacity of merchantmen may be judged from indications of their cargoes or their dimensions. The stone for some archaic statuary or masonry was carried by sea; there are surviving statues of more than 20 tons and blocks of more than 30. Round ships could carry considerably more. Gifts of grain to Athens in the late 4th century BC are attested in quantities of 3000 *medimnoi* (*c.*120 tons) and less frequently of 4000 *medimnoi* (*c.*160 tons) and they are plausibly whole shiploads. The 3000 wine jars that were the cargo intended in [Demosthenes] 35 are likely to have exceeded 100 tons. A decree from Thasos of the 3rd century BC excludes ships carrying less than 3000 talents (*c.*80 tons) from one harbour and less than 5000 talents (*c.*130 tons) from another. There is evidence of much larger cargoes. Privileges in the Roman period were available in respect of vessels carrying at least 50,000 *modii* (*c.*340 tons) of grain (*Digest*, 50. 5. 3) and there are wrecks of the Roman period with more than 400 tons aboard. The vessel that brought the Vatican obelisk to Rome must have been able to carry around 1300 tons (for the ballast see Pliny, *Naturalis Historia*, 16. 201); vessels with such dimensions seem from the tone of Pliny's reference to have been unusual enough to provoke wonder (cf. The *Navigium* of Lucian for the wonder that a ship of enormous dimensions could provoke). The largest vessel that is known (through a description reproduced by Athenaeus, 206ff.) from antiquity was built in the 3rd century BC for Hiero of Syracuse; its size has been estimated at around 2000 tons. The largest vessels of antiquity thus approached the limits of purely timber construction. It was not until the 19th century that ships became substantially larger. Passengers in considerable numbers are recorded on long-distance voyages: 600 from Palestine to Rome (Josephus, *Vita*, 15) and 276 (including crew) on the ship that took St Paul as far as Malta (Acts 27: 37), this at the extremity of the sailing season.

The speeds of which ancient ships were capable were less important than the fact that they were at the mercy of the

winds and weather (the discovery of the periodicity of the monsoon was for this reason very important for Indian Ocean traffic) and that in winter navigation generally stopped (this defined what journeys could be undertaken). A replica of the Kyrenia wreck (*c.*300 BC) has reached 9 knots under sail and records of remarkably fast voyages show that speeds of 5 knots or more could be averaged over several hundred miles. Conversely on a voyage against the prevailing wind a ship was doing well to average 2 knots. The prevailing direction of the winds defined the expected journey times of ancient travel (e.g. fast from the northwest towards Egypt but slow in the opposite direction) and the superimposition of a short sailing season further limited the possibilities. The risks in pushing one's luck with the seasons are accessibly exemplified by Acts 27–28; the story of Paul's journey to Rome is one of the most vivid records (Synesius, *Epistles*, 4 vies with it) of the vagaries of an ancient sea voyage.

As in the modern world, it was much cheaper in antiquity to transport goods over water than over land; to quote a classic inference from the Diocletianic price edict, "it was cheaper to ship grain from one end of the Mediterranean to the other than to cart it 75 miles". Nevertheless, the function and significance of shipping in antiquity are controversial; the divisions in the controversy are aligned with those on the nature of the ancient economy generally. That contradictory accounts of, say, trade in the Archaic period or lending in Classical Athens are pressed on the public with equal conviction is partly due to the nature of the evidence: fragments that may be fitted into different pasticcios whose shape owes more to the restorer than to them. Even apparently elementary questions (e.g. how many of the maritime lenders known from Athens in the 4th century BC were Athenians and/or merchants?) receive different answers because of the opacity of sources that were not composed to satisfy the curiosity of modern scholars. By and large, rival interpreters have not attempted a reconciliation of their differences and the diversity of their views cannot be conveyed in a brief entry.

From the 4th century BC organizational features of shipping that were to endure for centuries (even to the present day) are clearly discernible. Much less can be discerned about earlier periods; this is doubly unfortunate because Greek seafaring created its most important and enduring monument in the vast diffusion of people and culture of the Archaic period. The mere existence of maritime adventures is easy to establish from a variety of sources: stories in Herodotus (e.g. the fabulous wealth gained by Colaeus of Samos and his crew as a result of an unintended voyage to Spain at 4. 152 or the journeys of the Phocaeans in the far west at 1. 163), the remains of trading settlements at, for example, Naucratis in Egypt (see also Herodotus, 2. 178f.) or Al Mina on the Orontes, fragmentary business documents recovered from trading posts of the outer fringes (Berezan on the north coast of the Black Sea and Pech Maho in the west). Since colonists did not set out for the unknown (Herodotus, 4. 150. 4), their choice of destination depended on information brought back by seafaring adventurers.

To picture their adventures, scholars have turned to the *Odyssey* (the earliest reference to seafaring, Hesiod's advice at *Opera et Dies* 618–94 being concerned with less ambitious journeys) assuming that it is, even when the characters are telling lies as at 14. 192–359, in background realistic. Attention is drawn to the commonality of the enterprise (necessary when a leader needed oarsmen and linked to a historical datum such as the dedication of Colaeus and his crew together) and its close association with the exchange of gifts or prestige goods on the one hand and raiding and abduction on the other. A precisely focused picture is impossible; despite elaborate attempts, the basis, for example, of the distinction between the high status of a Mentes (actually Athena in disguise) in search of copper in exchange for iron at 1. 179ff. and the low status of a trader mindful of his cargo (8. 159ff.) is elusive. It has been suggested that by the end of the Archaic period the wealth of some cities (e.g. Aegina) depended on seaborne commerce.

The 4th century BC reveals a clear separation between hull and cargo interests and the finance of cargo by bottomry loans (under which repayment was contingent on the safe arrival of ship and cargo), a financial device that was to endure into the modern world. There is evidence of elementary economic rationality in, for example, the stipulation of maritime lenders that the cargo was to be worth twice the loan and that the borrower was to borrow no additional sums from others, or the diversion of a grain cargo to a port at which prices were higher (Demosthenes, 56). That hardy perennial, the maritime fraud, also heaves into view (Demosthenes, 32). The status and wealth of the participants and the scale and significance of their activities have been much debated. By and large, throughout antiquity, the masters of vessels and the merchants who travelled with them were of low status and for the most part their means were also modest. When, in the case of late antiquity, comparisons are possible, even the largest merchant fortunes are dwarfed by landed wealth. Arguments from silence indicate the same for earlier periods. The capital, though, for the business either in the form of bottomry loans or even ownership of vessels seems throughout antiquity to have been provided by persons (and later institutions such as the Church) of wealth and status. The amount of maritime activity in antiquity cannot be quantified. On the demand side certain large cities (in chronological order Athens, Alexandria, Rome, and Constantinople) imported a significant proportion of their grain needs over water and attracted delivery of luxuries over considerable distances. On the supply side it is difficult to identify cities for which maritime activity was in itself significant. In the Classical period Aristotle names Aegina and Chios (*Politics*, 1291b24); Phaselis is also possible. Later Rhodes is a clear example; with cities such as Alexandria (or for instance Nicomedia in the Roman period) it is hard to tell the relative importance of the maritime activity attested.

The strictly economic effect of maritime activity in antiquity may have been slight, the social status of its participants low by comparison with their counterparts today, and most detail of its organization obscure. These facts do not contradict the assumption of a much wider significance for shipping in antiquity. Already by the 4th century BC a city's access to the sea had effects notable enough for its merits to be the subject of debate (Aristotle, *Politics*, 1327a11ff.). Throughout antiquity ships were the uniting link in the Mediterranean world.

If we pass over the thousand years ending around AD 1700, it is not because maritime activity ceased completely. People continued to travel on ships, the so-called Rhodian Sea Law was recopied presumably because it had a use, references to

maritime loans and cargoes occur. But it is extremely difficult to synthesize this scattered material into a general picture. When with the Italian archival material at the end of the Byzantine period the available documentation becomes richer, the Greek representation is found to be very small. The Ottoman conquest was followed by chaos and depopulation in the Aegean and such Turkey trade as there was was carried in western ships. There are glimmers of revival in the 17th century (in the relative prosperity of settlements such as Lindos and Patmos or passing references in Evliya Çelebi to rich Greek shipowners at Yenikoy) but the scale is very small. A significant revival began only with the stabilization of Ottoman relations with the west from the end of the 17th century (notably through the Treaty of Karlowitz, 1699, and the Treaty of Passarowitz, 1718) and the increasing access to western markets of produce from the southern Balkans.

For this reason the first sizeable merchant fleets were formed in western Greece, chiefly at Missolonghi (whose connections were with the Ionian islands, then Venetian, and Epirus) and Galaxidi (whose connections were with the Morea). The development of these fleets is obscure, but it was extremely rapid after about 1740, and by the 1750s they dominated the trade between the west coast of Greece and Italy. In the Aegean, development was a little slower. While 40 to 50 indeterminately "large" ships are attributed to Mykonos in the early part of the 18th century, Hydra, which was to become preeminent by its end and has the best-documented history, created a vessel of more than 100 tons (a *latinadiko*, twin masted with lateen sails) only in 1745. Up to that time the predominant vessel had been the *sakhtouri*, a small vessel of up to 15 tons engaged solely in Aegean traffic. It has been suggested that a stimulus to the development of Greek shipping after the middle of the century was the weakness of its chief rival, France, during the Seven Years' War.

Notable features of Hydra's development include: its original poverty, which pushed the inhabitants to sea; the favour it enjoyed as a supplier of crews to the Ottoman navy; its astuteness in keeping in with both sides during the Russo-Turkish War of 1770–74 so that unhindered by either it overtook other islands such as Mykonos; and the windfall of the continental blockade during the Napoleonic wars, which the Hydriots had the pluck to run to phenomenal gain. At first the Hydriots did not have the resources to take risks with cargoes and so ships were let on charter to merchants. Later maritime loans would be raised from financiers (*cambiadori*) and later still cargoes were financed by the resources of the owners. To disperse risk, a rich man's wealth would be spread over several vessels and maritime loans, and it was extremely uncommon for a vessel to be in single ownership. The crew (which exceeded 60 on larger vessels) was generally paid out of a profit share. Success led to a gradual increase in the size of vessels. By 1812 the most common size was between 250 and 300 tons and some vessels exceeded 450 tons. At this time Hydra had the largest merchant fleet in the Greek world, twice as large as its neighbour and nearest rival, Spetses. Notable for its weak presence in shipping at the time was the richest island of the Aegean, Chios. The Greek merchant fleet seems to have continued to grow even after the end of the Napoleonic boom and to have reached about 700 vessels on the eve of the War of Independence.

During the war 80 per cent of the fleet (which doubled as a navy) was obliterated, and it did not regain its prewar capacity until the 1840s. By this time the centre of gravity had shifted to Syros (which was also the most important centre of Greek shipbuilding in the 19th century). Greek ships seem to have operated almost exclusively in the eastern Mediterranean and the Black Sea and to have been losing ground to western vessels of greater capacity. The fleet, nevertheless, continued to grow and almost doubled its capacity by the mid-1850s, partly in response to the stimulus provided by the Crimean War.

Conversion to steam was the most significant trend in 19th-century navigation. This was relatively slow because substantial improvements in engine technology and ship construction were required for the steamship to become a competitive carrier over large distances. Even in the most developed fleet, the British, steamships did not provide a majority of capacity until the late 1880s. At this time Greece had hardly started its conversion to steam and did not reach a similar stage till after 1900.

The first Greek steamships belong to 1857, but the fact (despite the efforts made to create them) was not of enduring significance. The ships served as domestic packet boats and the owning company folded after an inglorious history. Around 1860 two Greeks based in Britain began steamship operations, but these belong to the history of British shipping. The start of Greek steam shipping was due to merchant families active in the Black Sea. The first steam cargo ship to enter the Greek registry was the *Chrysovelonis* (of M. Chrysovelonis of Vraila) in 1874 and it was soon followed by others. Rapid growth in steam navigation came after 1890 partly with the development of a financial structure from the same source (specifically the trading houses of P. Vagliano and M. Zarifis) which was to survive until World War II. The trading house provided half the capital for the purchase at interest and with priority on repayment and also undertook the management. This provided capital to those to whom it was otherwise inaccessible but at the same time provided a high return on invested funds and additional commissions from management. Funds for shipping were also raised from domestic investors whose interest was excited by the extremely high returns available during the Boer War. By 1906 Greeks were the largest purchasers of second-hand British tonnage and between 1890 and the eve of World War I the steam fleet had grown tenfold. Greek shipping already had a character it was to retain for the rest of the 20th century, as a low-cost competitor in the general cargo trades; the fleet was still very small, only 3 per cent of Britain's (which then accounted for 45 per cent of world tonnage) and well behind the US, Germany, Norway, Italy, and Japan.

During World War I the Greek merchant fleet shrank by about 70 per cent, but more than half of this reduction was due to sales at inflated war prices. Compensation was also available for some losses with the result that funds for reinvestment were plentiful. Those who succumbed quickly to the temptation regretted it, for ship prices fell abruptly after 1920 and collapsed altogether in the early 1930s. Yet the Greek flag fleet more than trebled in the inter-war period. The stimulus was obviously cheap prices (as shown by the peak years for acquisition, 1933 and 1934, and the advanced age of the vessels acquired). But it was remarkable that the risk was taken. An explanation is in the small scale and informal constitution of

many Greek shipping enterprises. The savings required for acquisition could be pooled by family members, many of whom would have made up the crew. This made for great flexibility on costs by comparison with competitors, as indeed they complained. By 1939 the Greek flag fleet at 1.8 million tons GRT was the third largest in the Mediterranean and the ninth in the world; significantly for the coming war the fleet was to a greater extent than any other (86 per cent) composed of general cargo vessels over 2500 GRT and in this capacity Greece was second only to Britain. There was also about 0.6 million of tonnage under foreign flag.

During the war the Greek flag fleet was requisitioned by Britain and about three-quarters of it was sunk. Some 2000 seamen lost their lives, proportionately as great a loss as Britain's. The war years were also marred by tension between the owners and the Greek government in exile on the one hand and the seamen's union on the other. A consequence was that the expansion of Greek shipping after the war took place mostly outside the Greek registry.

The defining characteristic of shipping in the half-century or so since World War II is an unprecedented increase in demand. The volume of maritime trade increased about tenfold and individual vessel sizes did much the same. The result, with important consequences, was not only that shipping became more capital intensive than ever before but that the capital required for entry rose dramatically. The period since the war can be divided into two halves. The first, during which the increase in demand for shipping was not fully matched by an increase in shipyard capacity, was generally profitable and during certain episodes (the Korean War, the closures of the Suez Canal in 1956 and 1967) exceptionally so; this ended in 1974. The reputation of shipping as a creator of fabulous wealth lingers from this period. In the ten years that followed, the volume of seaborne trade hardly grew at all with the consequence, since vessels (particularly oil tankers) had been built on the presumption of continuing growth, of appalling results. From the mid-1980s growth in seaborne trade has resumed, but the profitability of shipping has been restrained by oversupply.

In consequence expansion was extremely rapid after the war. Greek-owned tonnage regained its prewar level by 1948 and continued to grow at well over 10 per cent per annum. By the early 1950s Greece outside its flag was already talked of as the third maritime power. In 1952 alone Greek owners were reported as having taken delivery of more tonnage from shipyards than was represented by the entire prewar fleet, and by the mid-1950s were said to control more than 50 per cent of the tramp and about 15 per cent of the tanker market.

Successive Greek governments, meanwhile, attempted to entice Greek-owned vessels into the Greek register by assuring freedom of capital movement and low taxation (related at first to gross income and then to tonnage). These measures began in 1951 and reached the apogee of favour during the dictatorship of 1967–74, after which the tonnage tax was substantially increased. The measures (together with the growing inconvenience of flags of convenience) resulted in the proportion of Greek-owned tonnage under the Greek flag growing fairly steadily from about one-third in 1952 to about three-quarters in 1980/1. Since then the process has gone into reverse because, despite concessions on the manning of Greek flag ships, crewing costs can be much lower with fewer Greeks in other registries. The result of growing prosperity in Greece is that Greek shipping is now Greek chiefly in a managerial sense. At sea Greeks serve only as officers (the number of active seamen has halved over the last 20 years and in respect of ocean-going vessels there are now only about 20,000) and with a vanishing interest on the part of the young in sea-based employment there is doubt about how they will eventually be replaced.

Providing even an economic assessment of Greek shipping is not easy. An account of the number and size of ships is no more a history of shipping than an account of the number and square footage of branches a history of banking. Yet a full history of Greek shipping is unlikely to be written. By a curious parallel with Classical Athens, shipping in modern Greece is "unseen" wealth of which no direct knowledge exists. Its most visible economic manifestation is the figure for invisible earnings from shipping in the balance of payments. This consists of seamen's remittances, pension contributions, taxes, and declared dividends to Greek nationals. It currently runs at about $2 billion per annum; in proportional terms it has appeared to wax and wane with the Greek flag fleet and the employment of Greek seamen. As a proportion of GDP it appears to have grown from about 3 to 5 per cent in the 1970s and to have declined to about 2 per cent since then. To name only other invisibles, it was overtaken by tourism in the mid-1980s. Two per cent is not a negligible proportion (it is the estimated contribution of "the City" to the UK's gross domestic product); but it may be misleading since Greek GDP figures are widely assumed to be incomplete and the figure for invisibles does not include all inflows from shipping activities.

A consensus (based on theoretical considerations and empirical evidence from better-documented cases such as the British) holds that general or bulk shipping is a business yielding low average returns and exhibiting high volatility. Some people can be successful some of the time in such activities, which is why they can attract, as do lotteries, a lot of people a lot of the time. But on the whole people do badly out of them and would be better advised to do something else. A useful analysis of Greek shipping would attempt to answer why it has expanded despite this fact. There are many possible explanations. A better choice might not be available (true of barren islands); ship operators might consistently make foolish choices (the lottery analogy) or have motives in which economic rationality plays an insignificant part; they may be the lowest cost supplier or extraordinarily lucky; they may to their own advantage be dividing risks and rewards asymmetrically with less-involved and worse-informed lenders and passive investors; there may be truly hidden returns at or beyond the boundaries of legality (e.g. blockade running, smuggling, or insurance fraud); and so forth. The information for such an analysis is unlikely to be forthcoming; its absence means that a good understanding of Greek shipping will remain elusive.

In the 8th century BC Hesiod's father went to sea leaving behind not wealth and prosperity but poverty (*Opera et Dies*, 637–38). The earliest passage on ships and shipping in Greek literature expresses an enduring truth. Poverty pushed the

Greeks to sea in the modern period as well, and is now pushing others to replace them.

Shrines, Wayside

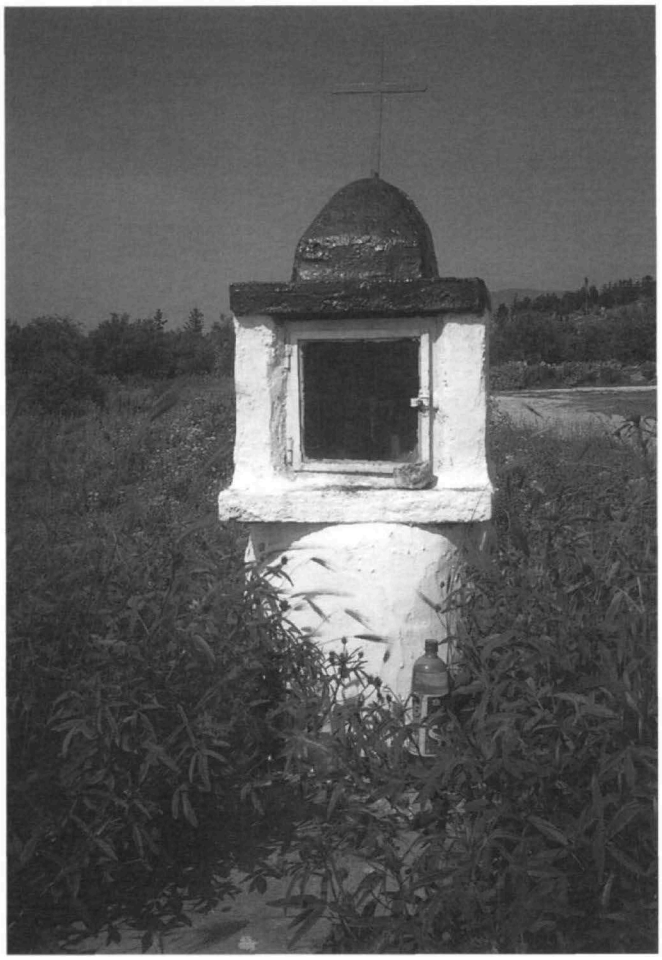
The wayside shrines (*proskynitaria* or *eikonostasia ton dromon*) scattered along most rural roads in Greece and occasionally found in urban locations are both a familiar part of the landscape of contemporary Greece and an inherent part of Greek popular religious devotion. They may well represent a development of Byzantine practices involving the veneration of icons, but while it may be superficially attractive to link them with rather similar phenomena in the ancient Greek tradition, such as herms or shrines to Hecate located at crossroads, there is no firm evidence to suggest a genuine continuity of religious expression.

With some rare exceptions, almost all wayside shrines may be considered primarily as markers, whether of accident sites or of turns and boundaries. Most contemporary wayside shrines stand at the sites of traffic accidents and are thus found particularly beside dangerous stretches of road, on steep mountain bends for example. Such shrines are erected either as memorials by relatives at the scene of fatal accidents or else as tokens of thanksgiving by victims or relatives at the site of accidents in which someone is believed to have been miraculously preserved. Other shrines that fulfil a related function may be placed not at the site of a particular accident, although a number of accidents may have occurred there, but at a location that is thought to be inherently dangerous in spiritual terms and where malign forces are believed to make themselves manifest.

Although most shrines erected in recent decades are of the accident marker type, it would be wrong to assume as a result that this is the original or only purpose of the *proskynitaria*. A substantial number of shrines are thus positioned at the junction of main roads with side roads or tracks that lead (almost always) to a church, monastery, or chapel. The primary function of these shrines is to indicate the presence of the adjacent holy place to the passer-by, although it may also be of practical use to a traveller in providing directions in areas where roads are generally unsigned. Closely related in function are the *proskynitaria* which, typically, act as boundary markers on the outskirts of villages; sometimes four shrines may "cross" the village, being set at the points of the compass, or more shrines may form a circle around it. To the minds of the local inhabitants these shrines delineate an area of sacred protection and aid, as well as of "civilized" as opposed to "wild" space.

A recent study of the shrines of the Argolid region has revealed that, at least in their present form, almost none is more than 40 years old and most have been erected within the last two decades. This is not to say that wayside shrines are a recent phenomenon in the Greek world, but is rather evidence of the fact that, due to the frequently flimsy nature of their construction and their dangerous location, they are essentially ephemeral things, vulnerable to decay and accidental destruction. There is plentiful evidence that the wayside shrines that serve as turn or boundary markers are constantly being replaced (although this does not appear to be the case with accident markers) and this indicates not only that the tradition is flourishing but also that it may well be a long one.

Within some basic parameters, the construction and design of Greek wayside shrines exhibits an enormous variety, and there are many distinctive regional and, indeed, very local features to be observed. The shrines, too, display a range from complex, professional, and extremely artistic creations to simple, sometimes ramshackle structures; it is clear that the purpose rather than the appearance of the shrine is paramount in many cases. Almost all shrines consist of a box (varying in size within a fairly standard range from c. 30 × 30 × 45 cm up to 60 × 45 × 60 cm) supported some 120 cm off the ground. Most contemporary shrines are constructed out of metal with a rectangular box (which may sometimes contain glass "windows") set on a post or legs; there may be considerable elaboration in the metalwork and also in the paint and decoration. Many others are made of masonry or concrete, and recent shrines are frequently faced with or built from marble, sometimes elaborately worked after the fashion of the funerary monuments to which they are related in design; here the box is either set on a rectangular plinth or forms part of a square column that may be topped by a dome. Shrines are occasionally constructed on or in walls, rocks, or the hollows of trees; with the masonry ones, these may perhaps reflect the oldest traditions of design. Almost all shrines have at least one cross set on their roof, while a fair number imitate (to varying degrees) aspects of typical church design. As a practical feature, many incorporate some sort of storage cupboard or niche, and a number, particularly older ones, include a money box.



Wayside shrine in western Crete

Almost all wayside shrines include the same basic elements used for the devotional practices connected with them, although there is great variety in their elaboration and in the care that is taken of them. The most important items in the shrine are undoubtedly the icons, most shrines containing one or two, with some having considerably more. These icons range from cheap card reproductions to more expensive copies of Byzantine originals, some with elaborate silver and gilt frames or covers; hand-painted icons are, however, very rare. A single icon is generally placed against the back wall of the shrine but, when there are a number of icons, that which is the most important (to attendant or location) occupies this position with the others flanking it; smaller icons are sometimes stacked in front of the larger ones. The subject of the icons follows traditional general and local patterns of popular veneration, with the Theotokos (Mother of God) being the figure most frequently represented. Understandably, the dedication of shrines, as exemplified by their icons and occasionally by an inscription, also corresponds in many cases to the association of local churches, monasteries, and natural features with particular holy figures; the same is true of occupations and thus, for example, shrines dedicated to St Nicholas (the patron of sailors) are more common by the sea. There is almost always a simple lamp (*kandili*) of some kind in each shrine, along with the various materials required to tend it (matches or lighter, wicks, a cloth, and bottles of water and oil). In some shrines the lamp burns constantly, but more usually it is lit only at night or on a saint's day or other occasion particularly associated with the shrine. Quite often there is also a small incense burner to be used on such special days, when the shrine may be further decorated or wreathed with fresh or artificial flowers. Functioning shrines are usually tended by neighbouring households that have a personal connection to them, but devout passers-by in general will acknowledge their presence by some simple act of devotion, such as making the sign of the cross.

Sicily

Greek colonization of Sicily began in the second half of the 8th century BC. Information about Sicily's indigenes is based upon archaeology and the untrustworthy evidence of later Greek and Roman writers. Thucydides (late 5th century BC), who took his information from an earlier contemporary Antiochus of Syracuse, whose history of Sicily stretched from the earliest period to 424 BC, relates that the first settlers, if Homer's Cyclopes and Laestrygones are excluded, were the Sicans, who claimed to be autochthonous, though Thucydides considered them migrants from Iberia. After them came refugees from Troy who settled at the western end of the island, where they later intermarried with Phocian Greeks driven there by gales at sea and became the Elymians, whose cities were Eryx (now Erice) and Segesta. Then, some three centuries before the Greek colonists arrived, the Sicels migrated from Italy, and gave the island its name.

Archaeology shows modest trade for 1400–1200 BC between mainland Greece and eastern Sicily, and yields no evidence for connections with Minoan Crete, in spite of the legend of King Minos' expedition against the Sican king Kokalos, which resulted in a settlement on Sicily by Cretans who found their retreat cut off. The period of destruction and migration *c.*1200 BC which affected the whole eastern

Mediterranean and Italy left traces on Sicily as well. But the "Urnfield" culture which is found in central Italy *c.*1000 BC does not appear in Sicily, and archaeology fails to corroborate the tradition of Sicel emigration from the mainland.

The first Greek settlement in the west was not in Sicily, but on the island of Ischia off the bay of Naples *c.*770 BC, followed on the mainland some two decades later by Cumae, some 14 km west of Naples. About the same time, the first colony in Sicily, Naxos, was founded on a headland below Taormina, which was the first landfall a sailing ship coasting eastward along the toe of Italy would reach. Then in rapid succession colonies were planted at Leontini, Catana (modern Catania), Syracuse, Zancle (soon renamed Messina), and Megara Hyblaea. Finally, in 688 BC, Gela was founded on the south coast. The founding city states were Chalcis on Euboea, which founded the four most northerly colonies, Corinth, which founded Syracuse (734–733 BC), Megara (Megara Hyblaea), and in the case of Gela the settlers were Greeks from Rhodes and Crete.

The subsequent history of these settlements varied: Syracuse with its splendid harbour became the greatest city in Sicily, while little Megara Hyblaea was razed *c.*483 BC and its population deported to Syracuse, the wealthy to be absorbed as citizens and the poor to be sold as slaves. Colonies themselves, once established, might send out colonies: Megara Hyblaea founded Selinus (modern Selinunte) in 628 BC, a century after its own foundation, and Gela founded Acragas (modern Agrigento) in 580 BC. Messina founded Himera on the north shore, and Syracuse founded Camerina on the south coast and two inland colonies, Acrae and Casmenae.

The two chief reasons for a city to send out a colony were the promotion of trade and the attraction of arable land, though there were subsidiary reasons in some instances, such as repeated crop failures, or an effort to dispose of potentially troublesome citizen groups. The 8th century BC saw a surge in population in Greece, as well as increased urbanization, marked by the development of the Classical polis (city state) as the unit of government. The pacesetters were the Greeks on the island of Euboea, where the two chief poleis, Chalcis and Eretria, cooperated in founding the first colony in the west on Ischia; but by mid-century Chalcis and Eretria were at war over ownership of the Lelantine Plain in Euboea, and Eretria, the loser, was sidelined. Corinth, an ally of Chalcis in the Lelantine War, was not far behind, and pottery from Corinth was to dominate Sicilian markets until the mid-6th century BC, when imports from Athens displaced it. Colonial foundations were state ventures: the government of the founding city organized the venture, usually consulting Apollo's oracle at Delphi first, and, with the oracle's approval and advice, it chose the colonists, generally unmarried men, and selected a "founder" (*oikistes*) who brought coals from the altar of Hestia in the mother city to light the hearth fire of the new foundation. Once arrived in Sicily, the colonists would acquire territory for themselves, preferably by peaceful means, and divide it into parcels (*kleroi*) for themselves. An urban centre was laid out with an agora as a place for commerce and city government, which, like contemporary polities in Greece, would be an aristocracy. The colony became itself a polis, politically independent, though it might be bound to its mother city by ties of sentiment, and if it in turn founded a colony, it generally invited a citizen from the mother city to serve as *oikistes*. Religion, too, came to the colonies as aristocratic possessions; at Megara Hyblaea, for instance, a century passed before a public temple was built in the agora.

The attitude of the native Sicels and Sicans to the Greek invasion varied. At Megara Hyblaea a Sicel king, Hyblon, helped the colonists find a site on his territory after their first attempts failed. Possibly he hoped for a buffer between his kingdom and Syracuse, for the Corinthian colonists led by their *oikistes* Archias seized their site by force, and once established, Syracuse reduced the Sicels in their territory to serfs called Killyrioi. The native policies of the Dorian Greeks differed from those of the Chalcidian foundations, which maintained generally friendly relations with the Sicels. But both Syracuse and Gela were assimilationist: Gela expanded at the expense of the Sican chiefdoms, and Hellenized as it expanded, and its foundation of Acragas in 581 BC marked the culmination of its westward advance into Sican territory along Sicily's southern shore. There was little overt native resistance to Hellenization, though in the mid-5th century BC a Sicel chief named Ducetius tried to launch a national movement, and captured an outpost of Acragas *c.*450 BC. But Syracuse came to Acragas' aid; Ducetius was defeated and exiled to Corinth, and though he returned and founded a city at Caleacte (modern Caronia Marina), he was no further threat to the Greeks.

The physical remains of Greek Sicily furnish impressive evidence for great wealth in the 6th and 5th centuries BC. On the acropolis of Selinus are the ruins of four Archaic temples and on a low hill to the east are three more, of which the 5th-century "Temple G", measuring 50 × 110.4 m, is one of the largest temples ever built. Yet it was rivalled by the great temple of Olympian Zeus at Acragas. The growing wealth and

population brought with it social unrest, and the names of various early tyrants have survived: Acragas had the dictator Phalaris (*c.*570–555? BC) whose cruelty was legendary: he was said to have a hollow bronze bull in which he roasted his enemies, and their cries issuing from the bull's mouth sounded like lowing! Historical sources become firmer by the end of the 6th century BC. At Gela two brothers, Cleander and Hippocrates, sons of an Olympic victor, ruled in succession from 505 to 491 BC, and after Hippocrates died in battle with the Sicels, his cavalry commander Gelon, son of Deinomenes (hence the name "Deinomenid" for the dynasty), succeeded, first as protector of Hippocrates' sons and then as tyrant in his own right. In 485 BC Gelon captured Syracuse where the aristocratic landowners, the Gamoroi, who had been driven out by the commons allied with the Killyrioi, had appealed to him, thereby giving him an opening. Then he transferred to Syracuse more than half the population of Gela which he entrusted to his brother Hiero, and rapidly added Camarina and Megara Hyblaea to his empire as well. Theron, tyrant of Acragas (488–472 BC), became an ally early in Gelon's career and gave his daughter Demarata to him as wife. The Theron–Gelon power bloc was ominous enough that when Theron took Himera, expelling its pro-Carthaginian tyrant Terillus, Carthage, which had planted footholds in western Sicily first at Motya, then at Panormus (modern Palermo) and Drepana (modern Trapani), reacted by mounting a major invasion which was utterly defeated at Himera by Gelon and Theron. A temple of Victory was built on the battle site at Himera, and a twin was built in Syracuse, where it still survives as the cathedral of the city. The Carthaginian attack took place in the same year, 480 BC, as the Persian invasion of Greece, and Pindar in his first *Pythian* written ten years afterwards in honour of a victory by Gelon's heir, Hiero, in the chariot race in the Pythian Games at Delphi, associates the victory at Himera and the Persian naval defeat at Salamis under the common motif of saving Hellas from slavery, while Herodotus reports a Sicilian tradition that the two victories were on the same day. This seems to have been the beginning of the myth that made Carthage a western outpost of orientalism, which in concert with Persia sought to extinguish western civilization at its birth.

Under Hiero, the Deinomenid dynasty rapidly lost its popular support, and his brother Thrasybulus, the next tyrant, was expelled by the Syracusans with support from Acragas, Himera, Gela, and Selinus, with some Sicel help. The following years in Sicily marked a democratic interlude, though political life remained turbulent, and there was sporadic warfare among the cities. In Greece itself, Athens emerged from the Persian Wars with a sea-based empire which showed an interest in Sicily, but it was not until after the Peloponnesian War between Athens and Sparta broke out in 431 that Athens undertook military intervention. In 427 BC it sent 20 warships to help Leontini against Syracuse; apparently its motive was to block grain exports to Sparta's allies in the Peloponnese. In 415 BC Athens again dispatched a large expedition on a Sicilian venture, ostensibly to help the Elymian city of Segesta against its neighbour Selinus. But its forces became bogged down in a siege of Syracuse and in 413 BC they were completely destroyed. Yet the Athenian intervention had disturbed the balance of power in Sicily, and Carthage, which after its defeat at Himera had remained at peace, intervened, whether from opportunism or because it thought its interests were threatened. In 410 BC it grasped an appeal from Segesta which was again menaced by Selinus. The Carthaginian invasion force destroyed Selinus and Himera in 409 BC, and three years later Acragas fell, followed by Gela and Camarina. In Syracuse, which had been torn by civil strife between the democrats and the moderate oligarchs, the defence was led by Dionysius, who had been a young lieutenant of Hermocrates, the leader of the Syracusan resistance against the Athenian expedition. Hermocrates had been exiled for oligarchic sympathies, and died in a failed coup d'état in 407 BC. Dionysius I was to emerge as the most famous of Sicily's tyrants.

From 405 BC, when Dionysius' career began, until the Roman conquest, Sicily's political history centres around a group of colourful tyrants. Dionysius, whose rule lasted 38 years, was a precursor of the Hellenistic monarchs who dominated the Greek world after Alexander the Great. Like them, he exploited dynastic marriages: he himself took two wives, one a Syracusan and the other from Locri in Magna Graecia, and he arranged political marriage alliances with his daughters. He converted the oldest section of Syracuse, the island of Ortygia, into a fortress for his courtiers and mercenary soldiers, and Greek tradition preserved legends about his elaborate precautions against assassination. He treated neighbouring cities ruthlessly, and bolstered Syracuse's defences with a rampart surrounding the Euryalus ridge which runs westwards from the city for several kilometres and at its western point built a fort which survives as the Castello Eurialo, though it has been much altered since Dionysius' day.

Against Carthage Dionysius fought with varying success: in 396 BC he won an overwhelming victory, aided by plague which broke out among the Carthaginian troops, and he turned back fresh attempts in 393 and 392 BC. But some five years later he suffered a defeat and he was in the midst of a new campaign against Carthage when he died and was succeeded by his son by his Locrian wife. Dionysius II preferred a softer, less active life and made peace.

The involvement of the philosopher Plato with the regime of Dionysius II is a curious adventure, described by Plutarch and by Plato's own *Seventh Letter*. Plato visited Syracuse in 388 or 387 BC and met Dion, the brother of Dionysius I's Syracusan wife. After Dionysius' death, Dion persuaded Dionysius II to invite Plato to instruct him on kingship. Plato made two trips to Syracuse; the first achieved nothing and he left for home in 366 BC, and his second visit, five years later, was equally unsuccesful. He failed to persuade Dionysius to recall Dion whom he had exiled to Greece.

However in 357 BC Dion returned with 3000 mercenaries and expelled Dionysius, but Dion's government rapidly became a disguised tyranny, and in 354 BC he was overthrown and killed by his own soldiers. Sicily lapsed into anarchy which not even the return of Dionysius II in 347 BC could quell, and, faced with a renewed Carthaginian threat, a group of Syracusan exiles appealed to their mother city Corinth, which dispatched the Corinthian citizen Timoleon with ten ships and 700 men to Sicily.

Timoleon's public career in Sicily lasted only from 344 until 337 BC, when he resigned his powers, but during this period he defeated Carthage and forced it back into the west corner of

the island, deposed the tyrants in the Greek cities, and set up a moderate democracy in Syracuse. Exiles were recalled, 60,000 new colonists were recruited in Greece, and the ruined Sicilian economy revived. In retirement he continued to be a respected counsellor of the new regime, but his intervention checked Sicily's decline only briefly. In 317 BC an unscrupulous demagogue, Agathocles, led an uprising against the Syracusan aristocrats, who were massacred or exiled and their lands redistributed. He was an astute and restless tyrant; in 310 BC, when Syracuse was faced with a new Carthaginian invasion, Agathocles mounted a brilliant counterattack in north Africa itself, which was initially successful, though in the end (November 307 BC) he had to abandon his army there and return home without it. The following year Carthage retreated to its corner of the island and made peace, and Agathocles spent the rest of his life consolidating his power in Sicily and south Italy.

Agathocles' empire disintegrated at his death (289 BC) and he left an unhappy legacy. His Italian mercenaries, who called themselves Mamertines after their war-god Mamers (Mars), seized Messina and used it as a base to ravage eastern Sicily. When they allied themselves with Carthage against Syracuse, the Syracusans appealed to the king of Epirus, Pyrrhus, who had just defeated the Romans in two costly victories in southern Italy in the employ of Tarentum, but had failed to achieve a profitable settlement and was ready for a new adventure. But Pyrrhus, brilliant tactician though he was, failed to expel Carthage from the island, and the Sicilian cities rapidly grew weary of his pretensions. Pyrrhus retired to Italy, where he lost his last battle against Rome at Beneventum, and Syracuse turned for salvation to one of his former lieutenants, Hiero, by origin a Syracusan. He was proclaimed king after he defeated the Mamertines in 269 BC and his reign lasted until 215 BC.

Rome's first clash with Carthage began in Sicily in 264 BC and the cause was once again the Mamertines. The First Punic War was long and destructive, and Rome suffered terrible manpower losses, but at the end Carthage departed from Sicily, which became Rome's first province. Syracuse, however, remained independent, for Hiero had shrewdly thrown in his lot with Rome, and it was not until the Second Punic War that Hiero's son Hiero II broke off the alliance and switched support to Carthage. The Romans thereupon laid siege to the city, captured it, and plundered it thoroughly. In the last years of the war Sicily became the base for Publius Scipio the Younger's attack on north Africa which culminated in the defeat of a Carthaginian army led by Hannibal at Zama, and when the war was over, all Sicily became a Roman province, paying tribute to Rome and governed by a Roman praetor (later a *pro praetore*), who installed himself in Hiero's palace in Syracuse.

Rome increased Sicilian grain production enormously, but the profits flowed into the pockets of Roman and Italian businessmen who built up large estates worked by slave labour. Two slave revolts, which were rare in the ancient world, broke out in Sicily under the Roman Republic, one in 139 BC which lasted seven years, and the other in 104 BC. The revolts did little damage to the cities, however, but the same cannot be said for the misrule of the propraetor Gaius Verres (73–70 BC) whose spoliation of Sicily is described vividly in Cicero's *Verrine Orations* which were published after Cicero prosecuted Verres for corruption before a senatorial court and forced Verres to go into exile without attempting a defence. The civil war which followed Julius Caesar's assassination also hurt Sicily, which was held by Sextus Pompeius for seven years during his struggle with Caesar's heir Octavian, the future emperor Augustus, and this was one factor in the decline of Sicilian wheat production, for Sicilian grain was cut off from its market in Rome. With Augustus, Sicily drew closer to Italy: he gave the Sicilians "Latin rights" and planted colonies of Latin-speaking army veterans at Syracuse, Palermo, Tauromenium, Tyndaris, Catana, and Thermae. In AD 212 all the islanders became Roman citizens.

In late antiquity the Vandals, who captured Carthage in AD 439, plundered the island and finally annexed it in 468, only to yield it eight years later to Odoacer who had deposed the last western Roman emperor and needed Sicily's grain. The Ostrogoths under Theoderic, who crushed Odoacer in AD 490, took Sicily the following year and held it until the Byzantine reconquest under the emperor Justinian (527–65). Justinian's war against the Ostrogoths in Italy was long and costly, but Sicily escaped the worst of it. It was not made part of the prefecture of Italy; instead it was governed by an imperial appointee with the title of "patrician" who was responsible to the "Quaestor of the Sacred Palace" in Constantinople, and the armed forces were commanded by a duke likewise responsible to Constantinople. But after the Lombards overran Italy and the Arab menace became acute, Sicily evolved into a "theme" commanded by a *strategos* (commander) and civil government withered. The emperor Constans II (641–68) came to Sicily and seems to have intended to move his capital there from Constantinople, but his oppressions led to his murder in Syracuse. Greek culture and language revived, however, particularly after the emperor Leo III the Isaurian (717–41) attached the Sicilian Church to the patriarchate of Constantinople, and Greek became once again the language of the streets.

The Arab conquest was sparked by the revolt of a Byzantine officer, Euphemios, who sought help from the Aghlabid emir of Kairouan. In AD 827 an expeditionary force from Tunisia, said to number 70 ships and 10,000 men, landed at Mazzara on the south coast. The conquest was slow: Syracuse fought off the initial attack, but in 831 Palermo fell to the invaders who were reinforced by a second fleet of 300 vessels from Spain. In 878

Syracuse was captured at last and sacked so thoroughly that it never recovered its position as the first city of the island. Constantinople could give little help, and in 902 the Aglabid emir captured the last Byzantine stronghold, Taormina, burned it, and killed its population. For over two centuries Sicily was to be under Saracen rule, and perhaps as many as half a million Muslims from Africa, Spain, and the Levant settled there. Christians and Jews were granted the rights reserved for infidels under Islamic law: those who were not enslaved by right of conquest became *dhimmis* (non-Muslim subjects), liable to a polltax (*djizya*) and a tax on their land (*karadj*), but they were allowed freedom of religion. Sicily prospered as a locale where Arab, Greek, and Latin cultures met, and if it were not for the Norman conquest, Sicily's subsequent history might have belonged to the orbit of north Africa. As it was, the Aglabid Caliphs at Kairouan fell in 910 and were succeeded by the Shiite Fatimids; and when the Fatimids moved their capital to Cairo in 969, Sicily became virtually independent under the Kalbid family, descendants of an able emir, al-Hassan, who had been appointed to Sicily in 947. Sicilian agriculture prospered: wheat was still the mainstay, but the Arabs introduced lemons, bitter oranges, cotton, the date palm, the mulberry tree, and papyrus, and reintroduced Roman irrigation technology which they themselves had mastered in north Africa. The Kalbid capital, Palermo, became a city of some 300,000 souls, a brilliant centre famous for its mosques, where Islam met both the Latin west and the Byzantine east. But by the 1030s rival Arab families in Sicily were challenging Kalbid rule, and the emir sought an alliance with the emperor in Constantinople who dispatched a Byzantine army led by George Maniakes to Sicily. For four years (1038–42) Maniakes led a successful offensive, capturing Messina first, followed by many other cities including Syracuse, which he attempted to restore as a Byzantine stronghold before he ran foul of court intrigues; his successor, the emperor Michael's brother-in-law, lost the conquests. Thus when Roger the Norman landed near Messina in 1060, Arab strength was sapped by internal division.

A half-century before the Norman conquest of England, Norman adventurers arrived in southern Italy, where at first they sold their services in turn to the Byzantines, Lombards, and Saracens, and then their ambitions extended to acquiring land for settlement: the first Norman to do so was Rainulf who got the county of Aversa from the duke of Naples, Sergius, in 1030, in return for help against the Lombard prince of Capua. In 1059 pope Nicholas II invested Robert Guiscard, the sixth of the 12 sons of a lesser Norman noble, Tancred de Hauteville, as duke of Apulia and Calabria and future ruler of Sicily. However, it was Guiscard's youngest brother Roger who led the conquest of Sicily. Palermo was taken in 1072 after a six-month siege, and in 1091 the last important Muslim stronghold, Noto, fell.

Count Roger's government restored Byzantine traditions; court ceremonial and protocol were borrowed from Constantinople, and since the Christians who survived the Arab regime were Greek Orthodox, Roger endowed more Greek than Latin monasteries. But he gave fiefs to Norman, French, and Italian immigrants who brought colonists from their homelands, and thus by the 13th century the dominant speech in Sicily had become a dialect of Italian. Count Roger's son, Roger II, added Apulia, which he incorporated into his realm on the death of his cousin, Capua, Naples, and the Abruzzi, and had won a foothold in Africa, and his admiral George of Antioch took Corfu and transplanted silk-workers from Greece to Sicily. Palermo became the most brilliant capital in Europe under Roger's son, Roger II, who was crowned king in the cathedral there in 1130 by a representative of the antipope Anacletus II, though it was more than eight years before pope Innocent II acknowledged the title. Arabs, Greeks, and Latins all served in the royal bureaucracy, though the chief officers were Greek and the flavour of the court was Byzantine. Sicily was a medley of cultures, held together by a monarchy which blended concepts of kingship taken from both Byzantium and Ottonian Germany.

But power was shifting towards the feudal barons; William I (the Bad) faced a baronial uprising in 1155 which he suppressed with help from his Muslim subjects, and when William II (the Good) died childless, the barons divided their support between William's aunt Constance, wife of the Hohenstaufen emperor Henry VI, and an illegitimate grandson of King Roger, Tancred of Lecce. Tancred secured the throne, but in 1194 he died, leaving only a boy to succeed him; when Henry invaded the island, the barons hurried to submit, and on Christmas day Henry was crowned king of Sicily in Palermo. His avarice and despotism soon alienated Sicily which rebelled, and while he was suppressing the revolt mercilessly, he died (1197), probably of malaria, at the age of 32, leaving behind a three-year-old son, Frederick.

During Frederick's minority Sicily fell into anarchy; the Muslim population rebelled and set up an independent principality and the German barons to whom Henry had granted fiefs took possession of Palermo and of the young king, in defiance of pope Innocent III who became Frederick's guardian on his mother's death. Frederick had to leave for Germany in 1212 to defend his election as emperor of the Holy Roman empire against the Welf candidate Otto of Brunswick, but he returned in 1220 and rapidly restored royal authority. The *Liber Augustalis,* the new law code he promulgated, defined a new concept of kingship: the emperor received his royal power from God; clerics were barred from interference in secular affairs; and criminal justice was reserved for the king. Self-government in the cities was disallowed, which had the result of forestalling the rise of any independent merchant class strong enough to counterbalance the landowning aristocracy. Significantly, the *Liber Augustalis* was in Latin, though a Greek translation was provided for the surviving Greek communities.

Frederick presided over a semi-oriental court; the popes, who found him altogether too rationalist and secular, referred to him as a baptized sultan. He claimed to love Sicily more than all his other possessions; yet he used its wealth to support his ambitions in Italy and Germany, and the long decline of Sicily began with his death in 1250. He had been excommunicated twice, and in 1245 he was formally deposed by pope Innocent IV; and upon his death, Innocent hawked the crown of Sicily around the courts of Europe.

Frederick's only legitimate son Conrad survived his father by only four years, but the heir of his Sicilian interests was his illegitimate son Manfred, first regent and then king of Sicily (1250–66). But the papacy would not accept a hated Hohenstaufen, and when a Frenchman became pope as Urban

IV in 1261, he determined to secure Sicily for a French ally. In 1266 Charles, count of Anjou and brother of St Louis, defeated and killed Manfred at Benevento. Two years later the 16-year-old son of Conrad, Conradin, made a last attempt to secure Sicily for the Hohenstaufen, but Charles defeated him and put him to death after a mock trial at Naples.

Angevin rule came abruptly to an end with a massacre known as the "Sicilian Vespers" which takes its name from the incident which sparked it: an insult offered on Easter Monday, 30 March 1282, to a young married Sicilian woman by a French soldier outside the church of San Spirito in Palermo and promptly avenged by her husband. At the beginning of the year Charles of Anjou was Europe's greatest sovereign: he was king of Sicily, Jerusalem, and Albania, Count of Provence, Forcalquier, Anjou, and Maine, regent of Achaea in Greece, Lord of Tunis, and a Roman senator, and in the first week of April his fleet was due to sail against the emperor Michael VIII Palaiologos (1261–82) in Constantinople. Messina, where the Angevin fleet lay at anchor, hesitated at first, but on 28 April it joined the revolt; the fleet was destroyed, and Charles's Vicar, Herbert of Orléans, was allowed a safe conduct out of the city for himself and his staff. Angevin oppression had united Sicily, and a personal affront supplied the incitement, but in the background were the intrigues of the emperor Michael and Pedro of Aragon, who had inherited the Hohenstaufen claim, and the go-between was John of Procida who had been Frederick II's physician and remained a Hohenstaufen loyalist. Legend has exaggerated his role, but there is no doubt that Aragonese agents were active in Sicily and smuggled in arms; and the emperor supplied money. Five months after the Vespers, Pedro landed in Sicily and on 4 September he was acclaimed king at Palermo.

Both Charles and Pedro died in 1285 and Pedro's son James inherited Sicily and, after the death of his elder brother, Aragon as well. James appointed his younger brother Frederick his viceroy in Sicily, although according to Pedro's disposition Sicily should have gone to him if James became king of Aragon. Yet it was Frederick who restored the island's independence. The Sicilians crowned him king in 1296 and he defended his kingdom successfully against both the Aragonese and the Angevins. Thus there were two kingdoms and two kings of Sicily, one with his seat at Naples who for convenience is called the king of Naples, and the other at Palermo. War followed by the Black Death was to exhaust Sicily in the next century. The last remants of the island's Greek population were absorbed, though Sicily had one last encounter with Greece: a temporary peace in 1302 freed Sicily from pillage by foreign soldiers of fortune and the most formidable of these armed bands, the Catalan Company, moved east and in 1311 conquered Athens and attached it temporarily to the Sicilian kingdom. But the heritage of Greece had passed into history.

Siegecraft

Whatever its historical validity, the Trojan War and its traditional length of ten years argue for an almost total lack of siegecraft in the Late Greek Bronze Age. That determined attempts were made to take cities, however, is indicated by the massive fortifications of the time (most notably at Tiryns), and that these attempts were mainly directed at the weakest points, the gates, is demonstrated by the existence, as at Mycenae, of a bastion to enable the defenders to hurl missiles at the unshielded left side of the attackers. Furthermore, although the battering ram is first known from Assyrian reliefs of the 9th century BC, it has reasonably been speculated that one with a reinforced head and slung beneath a wooden frame may lie behind the tale of the wooden horse.

Whereas in the Late Bronze Age only the king's palace and its immediate vicinity were fortified, the polis (city state) that emerged at the end of the Dark Age demanded protection for its much larger urban centre. It was, however, only in the late 6th century BC, against the Persian threat to Greek settlements in Asia Minor, that attempts were made to embrace with walls whole cities (and by the 4th century BC agricultural land as well), and not until the 5th century BC that numerous towers were built to facilitate the hurling of greater concentrations of missiles. However, even insubstantial walls were generally sufficient to withstand most hostile attacks. With the exception of a few very small places (e.g. those captured by Brasidas in Chalcidice), treachery and starvation consequent on circumvallation were the engines of capitulation. This situation was probably due to contemporary emphasis upon the hoplite at the expense of archers and slingers who could have afforded covering fire for the attackers. Nevertheless, expertise in the

design and placing of walls and counterwalls by besiegers and besieged made considerable advances (well illustrated in the Athenian siege of Syracuse in 415–413 BC, Thucydides, 6. 63–7. 87).

Siege engines, however, did make a tentative appearance. Rams and "tortoises" (protective sheds) built by a certain Artemon of Clazomenae were introduced by Pericles at the siege of Samos in 440 BC, but Diodorus (12. 28. 3) gives no details. Similarly Thucydides merely mentions (2. 58. 1) "machines" used unsuccessfully by the Athenians at Potidaea in 430 BC. He does, however, describe at great length (2. 75–78) the siege of Plataea in 429–427 BC. The mound built by the attackers against the city wall was countered by the erection on that wall of a wooden frame filled with bricks by workmen protected against flaming arrows by screens of hides. The defenders also knocked a hole through the bottom of their wall to withdraw earth from the mound (an action countered by the Peloponnesians' plugging of the gap with heavy reed baskets of clay), and subsequently they tunnelled underneath to remove loose earth from the bottom of the mound. They further built a crescent-shaped inner wall at this point, a tactic which was to become standard. The blockading Peloponnesians for their part failed to break through with battering rams, because the Plataeans raised up the heads with nooses or snapped them off with beams let down from chains. The attackers' incendiary attempt with faggots piled up against the wall and kindled with brimstone and pitch failed, however, only through rain and the absence of a favourable wind. They consequently resorted, ultimately with success, to circumvallation and resultant starvation. "Machines" on board ships were nevertheless instrumental in capturing two towers on the Megarian island of Minoa in 427 BC (Thucydides, 3. 51. 3); and fire was successfully employed, though only against the palisade of a garrison, at Delium in 424 BC when it was driven through a pipe by bellows (Thucydides, 4. 100).

Huge advances were made in the 4th century BC in siege engines and artillery. Siege towers, possibly learned from the Carthaginians, and arrow-firing catapults, possibly an Assyrian invention, were already being used by Dionysius I of Syracuse at Motya in 397 BC (Diodorus, 14. 48–53), and by the time of Alexander's sieges of Tyre and Gaza in 332 BC siege techniques and machines, including stone-throwing catapults, almost always gave the attackers the upper hand. An eminently sane treatise from the middle of the 4th century BC by an author known today as Aeneas Tacticus (probably the Stymphalian general Aeneas) gives a sobering picture of the strains of a city under siege. It details such things as the organization of guards, scouts, patrols, sorties, and passwords, the smuggling in of weapons, proclamations to the citizenry, the threat of plots, the allaying of panic, and the contrivances needed to counter siege engines, artillery, and sapping. This formidable legacy of technical knowledge was further developed throughout the Hellenistic period. This can be seen, for instance, in Diodorus' account (20. 81–88, 91–100) of the siege of Rhodes in 305–304 BC, which gave its protagonist Demetrius I of Macedon his soubriquet Poliorcetes ("Besieger"), and descriptions (Polybius, 8. 3–7; Plutarch, *Marcellus*, 4–17) of Archimedes' innovations at Syracuse in 213–211 BC.

Technical details of artillery come from four ancient authors. The earliest, a treatise of *c.*240 BC by Biton, supplies instructions for mechanics and includes valuable details on advanced non-torsion catapults. The work of Philon of Byzantium from *c.*200 BC gives critical descriptions of standard and novel torsion catapults. Vitruvius, the Roman architectural writer (*c.*25 BC), is useful for giving highly detailed dimensions, which he probably found in Greek sources. Of Heron of Alexandria in the late 1st century AD there survive two works, one (*Belopoiika*, probably derived from the lost works of Ctesibius of Alexandria) mainly valuable for its descriptions of early non-torsion and torsion catapults, the other (*Cheiroballistra*, but the title may be corrupt) detailing a contemporary torsion weapon with an all-metal frame.

The earliest catapult, the *gastraphetes* ("belly-bow"), had a concavity at the end of the stock which was held against the stomach. An arrow placed in a groove was fired by means of what amounted to a composite bow, whose manipulation was aided by ratchets, pawls, and a triggering mechanism. Its effective range of possibly 200–250 m was somewhat superior to that of the hand-held composite bow (itself known from the Bronze Age). It was subsequently enlarged and furnished with a base to stand on the ground, a universal joint for efficient aiming, and a winched pull-back mechanism, and it could be adapted for stone-throwing. Though superseded by the late 3rd century BC, non-torsion machines reappeared in the 4th century AD and spawned the medieval crossbow.

Probably around 340 BC there appeared also the superior torsion weapons in which, effectively, the composite bow was replaced by wooden arms inserted into "springs" of twisted sinews (and occasionally hair). Of two sorts, the *euthytone* to fire arrows, and the *palintone* to hurl rocks, these swiftly became superbly engineered machines, each being optimally designed for the length of arrow or weight of shot. They could project also incendiary bombs consisting of pitch, sulphur, tow, etc. packed into pots (and, if sources are to believed, on one occasion, by Hannibal, even live poisonous snakes). The *polybolos* ("multithrower") described by Philon had an ingenious ammunitionfeed for rapid firing. Such engines were used by besiegers and besieged from the ground, walls, siege towers, and ships. The maximum range, at which point accuracy was much impaired, was probably around 500 m. The main defence was padding on the walls to soften the impact of rocks, while the Tyrians erected on their walls mechanically rotating multi-spoked wheels to deflect Alexander's arrows.

Although circumvallation was still commonly practised, sometimes (and often by the Romans) with an outer wall to protect the attackers from a relieving force, offensive weapons besides artillery were also improved. Siege towers reached massive proportions under Demetrius Poliorcetes, his nine-storey monster at Rhodes being *c.*45 m high. On huge pivoted wheels, it was strongly protected and even furnished with mechanical shutters over the catapult ports. His rams too were massive, the largest being *c.*55 m long. Rams were frequently sheathed in iron and their points could be specifically designed to wreak maximum damage on stone walls or wooden gates. The larger ones were sometimes mounted on rollers and many were slung from a penthouse roof by ropes. One such early penthouse of Alexander was surmounted by a 9-m tower to house a small catapult and pots of water to extinguish fires.

Scaling ladders were improved, some being protected by attached shields and others mechanically operated. Sapping and counter-sapping techniques developed, including timbered galleries and devices for detecting tunnels, while at the siege of Ambracia in 189 BC pungent smoke was driven in the diggers' faces through an iron tube by means of bellows. Against blockading ships defenders could use submarine stakes in the virtually tideless Mediterranean and fire-ships (as famously at Tyre) while, according to a perhaps over-imaginative tradition, Archimedes employed grappling hooks on chains to lift and catastrophically release ships' prows and also set smaller boats on fire by concentrating on them the sun's rays reflected from shields.

Apart from improvements in architecture the main advances in siegecraft during the Roman period were in artillery, in the introduction of the *cheiroballistra*, and, by the 4th century AD, the one-armed stone-throwing torsion *onager*.

The Byzantines' most important contribution was in architecture, most notably the superb walls of their capital, which were never properly broken through by any enemy. Artillery saw the invention in the 7th century of Greek fire, which was employed in siege warfare as well as at sea. The adoption from the peoples of the steppes of the immensely powerful trebuchet or mangonel in place of torsion engines increased the range of artillery, but at some expense in accuracy. The motive force in the trebuchet was the weights attached to the butt end of a pole which was placed over a crossbar, furnished with a cup or sling for the missile, and pulled down by ropes which were released for firing. Cannon were used at the siege of Constantinople in 1453, but only by the Turks after Constantine XI had through poverty rejected the assistance of Urban, the Hungarian gunsmith. Byzantine military manuals (see Dennis, 1985) largely repeat inherited knowledge, which was frequently put to good practical use. An anonymous 10th-century treatise, known today under the Latin title of *De Obsidione Toleranda*, details the stockpiling of various foods and other materials and the choice of personnel most useful in withstanding a siege, while Eustathios, archbishop of Thessalonica, memorably relates the siege of his city by the Normans in 1185, in which he himself took a valiant part. The choice by Constantine XI of a famed expert in siege warfare, the Genoese soldier Giovanni Giustiani Longo, to supervise the defences in 1453 proved to be the immediate cause of the taking of the city (through his retirement from the battle upon injury despite the emperor's entreaties); but it also dramatically demonstrates that Greek contributions to the science had by then come to an end.

Sikelianos, Angelos 1884–1951

Poet

Angelos Sikelianos is one of the major poets of modern Greece. His creative period stretched from 1902, when he first began publishing poems in literary magazines, until shortly before his death, in 1951. All the influential poets of his time, including representatives of its two main literary movements, Symbolism and Surrealism, acknowledged him as a leading voice. Sikelianos does not, however, belong to any single school or generation and does not even fit into the broader division of modern Greek poetry into two main schools, the Athenian and the Heptanesian, since he combines both traditions in his poetry. Literary historians place Sikelianos in a category of his own, like Constantine Cavafy.

Born on the Ionian island of Leucas, the son of a schoolteacher and the youngest of seven children, Sikelianos was educated locally and at Athens University (where he failed to complete his studies in law). Since there was no family money available, Sikelianos had no clear idea of how he was to support his ambition to become a poet until, through the agency of his sister Penelope, he met and married the American biscuit heiress Evelina (Eva) Palmer (1874–1952). The marriage took place in 1907, when Sikelianos was 19.

The year 1909 saw the birth of Eva and Angelos's only child, Glavkos, and the publication, at Eva's expense, of Sikelianos's first major poem, *Alaphroïskiotos* (The Light-Shadowed One), together with the sequence of short lyric poems, *Ionian Rhapsodies*. This pattern of long and short lyric poems was to be repeated, and Sikelianos was to publish a further eight collections of short lyric poems (*Songs of Victory* I and II, *Descent into Hades* I and II, *Sonnets*, *Heavenly Aphrodite*, *Orphic Songs*, and *Desires*) and four extended poems (*Prologue to Life*, *Mater Dei*, *Easter of the Greeks*, and *Delphic Word*).

The poetry of Sikelianos is a product of painstaking craftsmanship, based on a complex system of poetics. It draws for its inspiration on two main sources: nature and other texts. Based on a close and accurate observation of the natural world of rural Greece, Sikelianos works with a system of nature metaphors, often very extended, to parallel the experience of the poet as individual and as visionary. At the same time, extensive creative use is made of intertextuality, and Sikelianos draws on ancient Greek poets and philosophers in his attempt to present time in cyclical, rather than linear, terms. Homer, Heraclitus, Pindar, and Aeschylus are particular favourites, but Sikelianos also makes use of the Septuagint, Byzantine liturgy,

and modern Greek folk poetry. Ancient, Byzantine, and dialect words coexist with standard modern Greek in his poetry, underlining his belief in the unity of the Greek language.

A consistent, stated aim of the poetry of Sikelianos is to bridge gulfs. In the first of the early *Ionian Rhapsodies*, the poet's persona speaks of "commingling" the Ionian sea with the Greek mainland, which may be read as a metaphor for combining the Heptanesian and Athenian traditions. In a poem from the late collection *Desires* ("Letter III"), the ability of poetic thought to conjoin incompatible elements is compared to the bridging of unfordable rivers by the god Dionysus, who "hung vines across the chasms of the world". Here, as elsewhere in his poetry, Sikelianos places the poet at the centre. The theme of return is also deeply entrenched in the form and content of Sikelianos's writing, promoting a cyclical view of life and art. A recurring metaphor for the poet is the returning Odysseus.

Sikelianos was the first poet of modern Greece to experiment with free verse. In *Alaphroïskiotos* he adopts and extends the approach of the French poets who first experimented with loosening the Alexandrine by using enjambment and overriding the caesura. Most of the poem is based on the commonest modern Greek metre, the 15-syllable line. *Prologue to Life* represents a far more extreme experiment in free verse, based on lines of differing lengths and differing metrical forms, and completely dispensing with rhyme. Originally printed (privately) in four volumes, a fifth part was added in 1946. It is characterized, like much of Sikelianos's work, by immense syntactic complexity which, in combination with its metrical freedom, sometimes gives an impression of incoherence. For *Mater Dei*, inspired by the illness and death of Penelope Sikelianou Duncan, Sikelianos returned to a strict metrical form: rhymed 15-syllable couplets. *Easter of the Greeks* (which remained unfinished) and *Delphic Word* also employ strict metrical forms and rhyme. All Sikelianos's poetry exploits the acoustic potential of language and is unusually dense in sound-patterning.

Between 1924 and 1936 Sikelianos produced very little poetry. During this period he was working to promote his "Delphic Idea": the establishment of a world spiritual centre and university at Delphi. In this project he was inspired by the religious syncretism of the French writer Edouard Schuré, but it was Eva Palmer Sikelianou who assumed practical responsibility for the two Delphic festivals of 1927 and 1930. At these festivals ancient drama was presented in its original setting for the first time since the inception of the modern Greek state; the stadium was used for athletic contests, and traditional handicrafts were exhibited in local houses. Largely inspired by the work of Isadora Duncan, who attempted to restore a classical simplicity to dance, and her brother Raymond (husband of Penelope Sikelianou), who affected ancient Greek dress, Eva choreographed the plays and set the choral odes to Byzantine-style music. Under her direction, ancient-style costumes were woven on traditional hand looms. The festivals directed international attention to Greece and inaugurated the reuse of ancient theatres. They may also be seen as the inspiration behind present-day arts festivals in Athens and elsewhere.

The Delphic project ultimately led to public ridicule, financial ruin, and the effectual break up of Sikelianos's marriage. Eva returned to the United States in 1933, ostensibly to raise funds to continue with the Delphic project. She did not return to Greece until 1952. Throughout her life Eva Palmer Sikelianou continued to promote Sikelianos's work, translating some of it with her daughter-in-law Frances Lefevre Sikelianos, and sending him money. She also continued to make suggestions for literary projects, encouraging Sikelianos to experiment with ancient Greek drama, a suggestion which he was to pursue, with mixed results, in his last years.

During the later 1930s Sikelianos wrote most of the poems of the two great collections of his maturity, *Orphic Songs* and *Desires*. In 1938 he met Anna Karamani, and the couple married in 1940, following divorces from their respective spouses. Although too old to serve in World War II, Sikelianos engaged in public acts of symbolic resistance during the German occupation. He read a specially composed poem at Kostis Palamas's funeral, and circulated the collection *Akritic Songs* (later assimilated into *Songs of Victory* II).

In 1946 Sikelianos collected his poems in the three-volume *Lyrikos Vios* (Lyric Life), which was republished posthumously in five volumes by G.P. Savidis (Athens, 1966; 2nd edition 1981). A sixth volume contains unpublished poems and juvenilia. The planned seventh volume, which was to have contained the editor's notes and a glossary, unfortunately never materialized. Sikelianos's plays and prose writing have also been collected and edited by Savidis.

Sikelianos died in 1951, after drinking Lysol (a disinfectant) in mistake for Nujol (prescription medication).

Silk

Silk is a luxurious fabric; it was called *serikon* because it was made by the Seres, the Indian people from whom wild silk was first purchased by the ancient Greeks. The Latin word *Seres* later came to mean the Chinese, when domesticated silk began to be imported from that country as well.

One type of silk fabric from northern India is called "tussah", or wild silk, and comes from the silkworm called the *Antheraea mylitta* of the family *Saturnidae*. This caterpillar, not needing to be domesticated, feeds on different types of leaves, including oak, and produces short fibres of a brown or yellow colour, that result in a fabric less fine and strong than domesticated silk. The date at which silk was first worn or produced in the ancient Near East and Greece remains a mystery, due to the perishable nature of cloth and the lack of precision in the ancient references about it. Biblical references (Ezekiel 16: 10 and 13) to silk and Herodotus' remarks (1. 135) about Median cloth probably refer to wild silk from India. Aristotle seems to have known something of silk processing (*Historia Animalium*, 5. 19. 6). In Hellenistic times a fine transparent cloth was produced called mussel silk, alluding to the threads by which a mussel attached itself to rocks, and most likely made from a mixture of Egyptian linen and Indian wild silk.

The thread of "true" silk, from China, is produced from the cocoon of the domesticated caterpillar, or silkworm, of the moth species *Bombyx mori* of the family *Bombycidae*. This thread is extremely long since the cocoon is spun with one continuous filament and can be woven into a fabric that is prized for its ability to be smooth, thin, and flexible, as well as strong and readily acceptable of dye. According to Chinese tradition, silk production was known from the Neolithic period and originated with Hsi-ling-shi (or Lei-tsu), the 14-year-old bride of the emperor Huang Ti. The legend credits her with the first knowledge of sericulture or the raising of silkworms. Silkworms were selectively bred until they were enfeebled, easily susceptible to temperature changes, unable to walk, and dependent on human attendants to feed them large quantities of fresh chopped mulberry leaves. At maturity the caterpillar spins a cocoon consisting of one very fine, long (500–1000 m) silk thread. The cocoon is then steamed with the caterpillar inside to prevent it from emerging and chopping through the thread. Six or eight cocoons are spun together through a water bath with an elaborate reel-and-pulley system to form a thread thick enough for weaving. It takes about 35,000 worms to produce 5 kg of silk.

Sericulture was successfully kept secret and guarded by the Chinese until the Japanese learned about it in AD 300. In the 6th century AD, during the reign of Justinian, two Nestorian monks were reputed to have concealed silkworms in a hollow cane and smuggled them into Byzantine territory, along with the procedures of sericulture.

The silk trade between China and the west cannot be traced with confidence before 115 BC. In that year the emperor Wu-ti of the Han dynasty initiated trade with Mithridates II of Parthia. Silk thread and cloth, although not the knowledge of its production, would thereafter be exported from China through the Tarim basin, across the top of the Kushan empire in India and, with the Parthians as middlemen, on to the Near Eastern coast, Asia Minor, Greece, and Italy. In exchange for the cloth, according to the annals of the Later Han dynasty, the *Hou-han-shu* (from the 1st century AD), the Chinese traders received gold, silver (both highly desirable due to the lack of such metals in China), precious stones, amber, glass, gold-embroidered rugs, gold-coloured cloth (from Syria and Alexandria), silk cloth of various colours, and fine cloth made from wild silkworms. The reason why the Chinese bought back silk at Merv is because their own silk was a heavy brocade and densely woven. Silk weavers in Syrian cities and Greek islands, such as Cos, specialized in unravelling the Chinese silk cloth and reweaving it into a lightweight, transparent gauze, thereby multiplying the lengths of fabric for sale in Roman cities, increasing their profit, and satisfying the upper-class desire for erotic, sensational fashion. Other fabrics such as flax and wool could also be mixed with it, which the Romans called *subserica* or *transerica*. Cos, in particular, specialized in a purple-dyed silk, famous enough to be called the "Coan purple" by Augustan poets (Horace, *Odes*, 4. 13).

Trade increased with the peaceful conditions of the Augustan era, but Roman authors from the time of the early empire were scandalized by wearers of silk, "clad in which no woman can honestly say she is not naked" according to Seneca. Although Caesar had silk curtains and Caligula, later, was rumoured to have worn silk clothing, many agreed with Tacitus (*Annals*, 2. 33) that "men should not disgrace themselves with silk clothing from the East" and an edict of the Roman Senate in AD 16 prohibited such dress for men. But the gulf between moralistic intellectuals and public desire was vast, and since all four territories along the silk route – China, India, Parthia, and the Roman empire – were peaceful from AD 90 to 130, the Roman empire acquired plentiful supplies of domesticated silk from China during this period, even though it was said to be worth its weight in gold, due to its difficult manufacture, middlemen fees, and long transport from China.

Strabo (15. 693) thought that silk grew on trees and had to be scraped off the leaves. Pausanias (6. 26. 6–9), however, knew that silk came from an eight-footed insect, called by the Greeks the *ser*, and that they were taken care of by the Chinese in special houses; he mistakenly thought that they were fed millet for four years. Missions were sent to China by Maes Titianus and Marcus Aurelius in the 3rd century to acquire more silk and information.

During the Byzantine empire the meaning of wearing silk, particularly coloured purple and gold, changed from defining women who lived off their beauty to distinguishing men of authority – the emperor, aristocracy, and ecclesiastics. The rarity and glitter of silk, purple dye, and gold embroidery were restricted to those at the top of the Byzantine hierarchy and separated them from common citizens and barbaric aliens.

Complicated monopolistic regulations enforced state control over the production, manufacture, trade, and export of silk cloth. There were two types of guilds in Constantinople that could work silk – imperial guilds (*demosia somata*) and private ones (*somata*). The imperial guilds were directly controlled by the state and manufactured textiles only for the emperor and his court, officers, and for gifts to foreign powers. During the late Roman empire in the 4th century AD rulers had frozen workers in their occupations, obliging them to remain in their guilds as part of a hereditary caste system. By the 6th

Silk: the Epitaphios of Thessalonica, a representation of Christ administering the eucharist to the apostles, in silk with gold and silver thread, 14th century, Byzantine Museum, Athens

century, in the time of Justinian, there were too many textile workers in the imperial guild, so restrictions and examinations were enforced. The head of the *Eidikon*, a branch of the state treasury, was the administrative supervisor of the imperial factory, which was largely housed in a wing of the imperial palace in Constantinople. The three types of imperial silk workers included tailors, purple-dyers, and gold-embroiderers.

The private guilds had begun to decline in the 4th century due to a shortage of labour and a limited supply of higher-priced imported silk because of the war with Persia. The labour shortage was adjusted by legislation that obliged workers to remain in their craft. Emperors tried to find alternative silk routes bypassing Persia, but were not very successful. The restriction on purchases of silk in the Byzantine empire by anyone other than a single imperial officer, the *Comes Commerciorum per Orientem*, however, was effective in keeping prices down.

Justinian took a further series of steps to increase the state monopoly on silk manufacture, which depressed the private guilds during his reign. First he legislated that imperial silk cloth could be purchased by the public but worn only by women, thereby increasing the market for the imperial guild. He also fixed a low price for raw silk at 8 *nomismata* per pound, which may be related to the introduction of the Chinese silkworm and sericulture into Constantinople in 553–54. The result was that foreign merchants refused to sell at such a low price, so the independent private guilds had their supply of silk cut off, and they either left Constantinople for Persia or tried to gain admittance to the imperial guild, which was doing quite well since retail prices for silk clothing had been raised to 6–24 *nomismata* per ounce.

By the late 6th century the single buyer was replaced by the *kommerkiarioi*, who could purchase raw silk at 15 *nomismata* per pound, but had to resell it at the same price to private merchants of raw silk, one of the private guilds, so that the state monopoly created by Justinian loosened. By the 9th century sericulture was thriving in the Byzantine empire and the guilds of merchants of raw silk and spinners could purchase silk without state intermediaries or price limits. The only legislation left concerning the wearing of silk clothing stated that purple cloth could not be manufactured or worn by the public. Besides the private guilds, noblemen were authorized for the manufacture of silk for their own households and certain workers of low status could buy soiled or damaged silk.

The *Book of the Prefect* (911–12), a collection of state-approved by-laws from the time of Leo VI, described the duties and rights of the private guilds and industry. The five guilds in Constantinople, by this time, were merchants of raw silk, silk spinners, clothiers and dyers, merchants of domestic silk garments, and merchants of imported silk garments. These workers were independent of the state and sold cloth to the public, but prerequisites for membership ranged from the necessity of a sponsor to large entrance fees. The goals of guild legislation were to stabilize prices, the amount of work, and the supplies of raw material.

Some Byzantine examples of imperial silk are still in existence, such as the Textile of Liège of the emperor Herakleios (610–41), the Textile of Siegburg of the emperors Romanos I and Christopher (921–31), the Textile of Düsseldorf of the emperors Basil II and Constantine VIII (976–1025), the Textile of Aix-la-Chapelle placed in the tomb of Charlemagne by Otto III (1000), and the Pallium of the emperor Michael VIII Palaiologos (1261). The types of weave included twill, typical until the 11th century; lampas weave, developed then; tabby, damask, and tapestry. The fabric was dyed in vivid yellow, red, blue, or dark purple with designs of heraldic lions, elephants, human figures, geometric patterns, arabesques, leaves, or flowers. Byzantine mosaics, such as the portrait of Theodora and her court at S. Vitale in Ravenna, supply additional evidence for patterns and colours used in royal silk.

Guild conditions continued to loosen until the 12th century when Jewish manufacturers of gold, silk, and purple garments were allowed to work in Constantinople, Thessalonica, and in Thebes. In 1147 Roger II captured Corfu, Corinth, and Thebes, and moved silk workers to Palermo in Sicily. Thebes was still producing silk in 1170, as reported by Benjamin of Tudela who numbered the Jewish silk workers at 2,000 in Thebes and 2,500 in Pera, when the Genoese were denied a licence to buy silk fabric in Thebes.

The Byzantine emperors had used their silk monopoly as a tactical weapon against Europe, guarding the secrets of sericulture as had the Chinese before them. Western rulers capitulated to the power of Byzantine ceremonial dress and its concept of "hierarchy through silk clothing". They tried to imitate purple silk, but never succeeded in producing the highly refined quality of Byzantine fabric.

The Genoese reintroduced the craft of silk production in the 15th century to the island of Chios, whose velvets and brocades remained popular in Europe until the 18th century. Silk embroidery was essential for regional, traditional Greek dress. Girls working on their dowry linens and hangings embroidered in predominantly red and blue silk floss. Designs were conservative and localized so that three main groups can be distinguished – the Aegean islands, with varied designs from figural groups to geometric patterns; Ionia, dominated by Epirus on the mainland with Ottonian-influenced vegetal designs; and Crete, with Venetian-influenced foliage, mermaids, vases, and birds in the Cretan feather stitch. Silk fabric, yarn, and floss for embroidery continued to be exported from Greece until the 1830s, when the mulberry trees in Greece became diseased and political instability increased.

In modern times silk is still produced on a small scale. Refugees from Asia Minor came to Athens and Thessalonica in the 1920s, reintroducing the techniques of silkworm breeding and the production of silk. It continues today as a localized industry, but the competition from cheap, mass-produced, and man-made cloth has lessened demand for it in the 20th century.

Silver and Lead

Silver and lead were probably among the first metals to be smelted and were used throughout the Copper, Bronze, and Iron Ages. The association of these two metals is fundamentally geological. Silver was valued and used in ancient Greece in exactly the same way as other cultures: for coins, plate, and statuary. Lead was used in its metallic form for anchoring the iron clamps used to secure stone blocks, for covering the hulls of ships, and as sinkers for fishing lines and standard weights. It was added to bronze to improve fluidity in casting and for the patina that such alloys develop. In Roman times large quantities were used for plumbing, cooking vessels, and other purposes. Indeed, lead poisoning may have been a significant problem for the wealthier sectors of the population. White lead (lead carbonate-hydroxide) was used in cosmetics, salves, and medicaments.

The most abundant ore of silver and lead is the lead sulphide called galena, which usually contains 0.1 to 0.4 per cent silver and some gold. This silvery-grey mineral, which breaks easily into cubes, may occur on its own, or associated

with copper or iron ores. However, in antiquity the ore first exploited may have been the minerals cerussite or anglesite, earthy, pale-coloured, surface-weathering products of galena. These oxidized ores are commonly richer in silver than galena. Some silver may have also occurred as the native metal, silver chloride and sulphide. However, these more easily smelted ores were probably exhausted by the Iron Age.

The raw ore was first purified by washing – a current of water was directed over the powdered ore and the associated minerals, which are lighter than the lead minerals, were removed. Lead and silver were then extracted from the ore concentrate by roasting with charcoal. If the smelting was done at high temperatures under reducing conditions, the silver in the ore was also extracted into the lead. It was then separated by cupellation – molten lead was exposed to a stream of air, whereby the lead and other base metals were oxidized. The silver remained as a molten bead on the lead-oxide slag (lithage). This simple process can yield almost pure silver. The lithage was resmelted with charcoal to recover the lead. Gold is also extracted with the silver but seems to have been rarely separated, although the technology certainly existed. The provenance of silver and lead can be determined from the isotopic composition of lead, which is used as a "fingerprint" for different ore regions.

Lead and silver mines were worked at Laurium, south of Athens, as early as Mycenaean times, but the really rich veins were not discovered or exploited before the 5th century BC, when this area became the principal source of silver for Greece. Initially, weathered ores were extracted, but later shafts were sunk into the primary galena ore. The silver produced in these mines was used in the minting of coins which were the source of much of the wealth of ancient Athens. The lead by-product was widely exported throughout the ancient Greek world, and has been found in western Turkey and Egypt. More than 2000 shafts produced about 8000 tonnes of silver and between 1 and 2 million tonnes of lead during antiquity. Activity ceased by the time of Christ, and was only revived late in the 19th century, but this time for zinc and manganese. The mines are now idle.

The primary ore at Laurium occurs as a replacement of marble near contacts with schists. The ore was formed during Miocene times (between 22 and 6 million years ago) from the watery solutions expelled during the crystallization of a granite. These solutions circulated along cracks in the rock until they reacted with the marble and crystallized galena and other minerals. The ore contained up to 50 per cent galena, but little can now be found in the area, testifying to the efficiency of ancient mining.

Siphnos was another source of silver and lead from the Early Bronze Age, a long time before Laurium, but production reached a peak at about the same time. The wealth of the island at that time is borne out by the opulence of their treasury at Delphi, which they built around 530 BC. During the 6th and 5th centuries BC silver, lead, and gold were produced in large quantities, but the mines were soon exhausted, and from then on Siphnos was poor and unimportant. As at Laurium, the ore formed as a replacement of marble by circulating watery fluids. The source of the fluids may have been metamorphism, or a granite pluton that does not crop out on the island.

The mines at Balya Maden (Asia Minor) have been active since Phoenician times. They may have supplied lead and silver to nearby Troy. They were particularly active from 1880–1940 and have produced about 400,000 tonnes of lead since Roman times.

There were other silver and lead deposits of lesser importance that were exploited in antiquity at Thera, Kimolos, Thasos, Mount Pangaeus, Mount Samsun, and Balya Maden (Asia Minor). Minor amounts of silver were produced from the natural gold–silver alloy electrum, especially at Sardis in Asia Minor.

Simokattes, Theophylaktos

Historian of the 7th century

Theophylaktos Simokattes was born in Egypt, and wrote his major historical work of the reign of the emperor Maurice (582–602) in the early 7th century. This military, diplomatic, and political history takes the Classical historians from Herodotus to Arrian as an example. The *History* continues from where Procopius, Agathias, and Menander Protector ended their accounts. Theophylaktos's *History* was later extended by the patriarch Nikephoros, who wrote a brief account of the 7th and 8th centuries.

There are three other surviving minor works of this author. One, the *Quaestiones Physicae*, is written in the form of a Platonic dialogue, and belongs to a pseudo-scientific genre of literature. The other, *Ethical Epistles*, is a collection of 85 fictitious letters, ranging from ethical to amatory subjects. Michael and Mary Whitby consider them to be juvenilia, literary exercises composed in testimony to the author's cultural attainments.

The third minor work of Theophylaktos is a discussion of the theological question of whether the duration of human lives is predetermined. The book, *On Predestined Terms of Life*, consists of a dialogue between two speakers, with another set of speakers pronouncing their verdict at the end. This work reflects the rhetorical education that Theophylaktos had no doubt received in his youth. It mirrors the *controversiae* which were a standard exercise in this type of education. In their discussion of *On Predestined Terms of Life* Michael and Mary Whitby point out that the conclusion reached by Theophylaktos in this work has relevance for his judgements of events in the *History*. He admires moderation in good and bad times, and he criticizes immoderation in both triumph and despair.

None of Theophylaktos's works can be dated precisely. His main work, the *History*, covers the 20-year reign of the emperor Maurice. It begins with his coming to the throne in 582, and reports as the last important event the death of the Persian king Khusrau on 25 February 628. Thus it seems reasonable to consider this date as the *terminus ante quem*. The eight books into which the *History* is divided have for their main theme the many wars that the emperor Maurice had to fight against the Persians on the eastern frontier, and the Avars and Slavs in the Balkans. Theophylaktos recognizes that there was little that Maurice could do in the earlier years of his rule, being confronted with war on two sides most of the time. He rejoices when finally a revolt in Persia led to the overthrow of the Persian king in 590, and his successor Khusrau II fled to the Romans asking for help. The situation brightened for Maurice with this event, and so, records Theophylaktos, he was able to return Khusrau to his kingdom, concluding a favourable treaty with him that lasted to the end of the emperor's reign. In general, Theophylaktos's account of Maurice's reign concentrates on the affairs of the empire in the east and Africa, neglecting Italy and the other provinces, which are hardly mentioned.

Theophylaktos's *History* is introduced with a dialogue between a personification of philosophy and history. According to Herbert Hunger, this is unique in Byzantine historical literature. Hunger thinks that Theophylaktos Simokattes used this rhetorical device indirectly to show reverence to the then emperor Herakleios by declaring the reign of his predecessor Phokas as an aberrant episode in history; and also to parade his own scholarliness.

On balance, the author of the *History* is considered to be objective and truthful. On the one hand, he is censured for his confusing chronology; and Photios later considers his heavy-handed use of rhetorical gags as immature tastelessness. On the other, Theophylaktos's work is considered valuable for the many references to peoples such as the Huns and Avars, since his sources are now mostly lost.

Although Theophylaktos seldom makes reference to his sources, it has been assumed that in his elevated position as *scholastikos* ("intellectual") and *antigraphevs* (assistant quaestor) he had access to documents and oral information. The sources used for the *History* that can be verified are mainly Menander Protector, and for books 4 and 5 John of Epiphaneia, with occasional help from the ecclesiastical history of Evagrios. The Whitbys postulate, besides the above, a "Herakleios source", a "Priskos source", the *Constantinople Chronicle*, and the hagiography of Maurice. The latter is used for describing the final days of the emperor during which various portents foreshadowed his tragic end. Hunger sees in the uncritical use of this hagiographical material a clear indication that a new historical epoch was beginning in 7th-century Byzantium.

The *History* of Theophylaktos Simokattes was used by later writers. Of these writers, Theophanes is the most essential for the reign of Maurice. His *Chronographia* treats the events from 284 to 813, and is partly based on works now lost.

Born in Egypt in the late 6th century, Simokattes had a civil service career rising to be *scholastikos* ("intellectual") and *antigraphevs* (assistant quaestor). His main work is a history in 8 books of the reign of the emperor Maurice (582–602). This continues where Procopius, Agathias, and Menander Protector left off. He also wrote philosophical and scientific dialogues and a collection of letters.

Simonides

Lyric poet of the 6th–5th centuries BC

Simonides was probably born at Iulis, the chief town of Ceos. Most sources set his birth around 557–556 BC (and some *c.*532 BC). Both he and his nephew Bacchylides, also a lyric poet and also born in Ceos, around 510 BC, were steeped in a cultural tradition marked by the worship of Apollo and Dionysus, which most probably accounts for the intellectual rigour and Bacchic enjoyment that marks their poetry in a way characteristic of lyric poetry of the 5th century BC in its entirety.

Simonides' poetry belongs to the new wave of choral lyric that flourished in the first half of the 5th century BC and which is represented mainly by the extant poems of Pindar, and the fragments of Bacchylides and Simonides himself. Simonides' artistic production, spanning the second half of the 6th and the first half of the 5th centuries BC, is situated at the point of transition from late Archaic to Classical art and so registers the developments triggered by this shift, especially in the field of choral lyric. That is, while the poetry is still heavily dependent on religious and other social occasions for its delivery, it also gradually ceases to preoccupy itself mainly with religious themes, and adopts wider political, moral, intellectual, and literary concerns.

No poem of Simonides survives in its entirety. But the extant fragments indicate that he was an expert in a wide range of lyric expression. We have evidence that he composed epinicians, dithyrambs, dirges, paeans, encomia, partheneia, elegies, and epigrams. His elegies included traditional sympotic pieces as well as some historical ones, such as the elegy on the Battle of Artemisium and the one on Plataea, a portion of which turned up in a papyrus published in 1992 (*Oxyrhynchus Papyri*, 3965).

Simonides was a professional poet with great scope and range. Ancient critics praised his elegant lyricism and his colourful and decorative diction, but they also admired his balanced discourse and the smoothness of his composition. The typical noble features of Archaic lyric are juxtaposed in his work with new ethical preoccupations, and sensuous details with gnomic austerity, just as the heroic absolutes of the aristocratic tradition are framed by a more tolerant and flexible world view that is willing to take into consideration inner conflicts and the uncertainties of fortune.

Simonides' work was an important influence on the poetic production of the two other major choral poets of the 5th century BC, Bacchylides and Pindar. And it was especially Simonides and Pindar who persistently incorporated in their poems reflections on the significance of their craft. Simonides regularly quoted and commented on the earlier poetic tradition and is believed to have explicitly compared himself to Pindar. Aligning himself with a strand of the tradition that goes back to Homer and Hesiod and looks forward to Plato and further down to the Hellenistic poets, he also stresses the alluring enchantment, and even falsehood, of song.

The complex relation of Simonides' art to both the preceding and the subsequent poetic tradition is best celebrated by the new fragments of *Plataea* discovered in *Oxyrhynchus Papyri*, 3965. These findings give us a proem to what seems to have been an elegy on an epic-like heroic event, which also happens to be of contemporary historical significance. A proemial hymn to Achilles suggests a parallelism between the Trojan and the Persian wars, thus striking a Panhellenic note that anticipates later historians and rhetoricians such as Herodotus, Thucydides, and Isocrates. Moreover, through this parallelism the Trojans are depicted as barbarians, thus foreshadowing their tragic counterparts in 5th-century Athens. And the connections are not yet exhausted: the new Simonides fragments combine features of Pindaric encomium, Homeric diction and narrative technique, and heroic historiography, all laced with elements of the epitaph and organized by a performer with a remarkably developed persona who dominates the short elegiac poem in a strikingly un-epic way. It is little wonder indeed that critics have detected in Simonides' work a primitive model of the famous Hellenistic features of miniaturization and crossing of genres.

Throughout his long life Simonides was commissioned to work in the courts of many tyrants. He also lived and worked in the cities of the new 5th-century BC democracy. He was notorious for demanding high fees: ancient sources describe him as a money-grubber and Pindar scornfully calls his muse "Muse for hire" (*Isthmian*, 2. 6). However, this mercenary attitude also indicates an emerging professionalism. The poet ceases to be the inspired mouthpiece of the Muses or other divinities and poetic creation is no longer or not mainly their inspired gift: it is rather the combined outcome of skill and practice for which the poet deserves remuneration. Simonides may have been frowned upon for his attitude to money, but his legendary high fees, together with his less solemn tone and a certain deviousness scattered in his poems, make him an

important precursor of the secularized art of the sophists of the Classical period.

Simplicius

Neoplatonist philosopher of the 6th century AD

Simplicius was one of the most important Neoplatonists of 6th century AD, and one of the last representatives of Greek philosophical thought, as he has often been described. Agathias informs us (*History*, 2. 30. 3) that he was born in Cilicia around AD 500. He was first educated in the philosophical school of Alexandria under the direction of Ammonius. He continued his studies in philosophy at the school in Athens under the leadership of its last director, Damascius, and remained there until 529, when the emperor Justinian closed the school. Then he moved with his master and five other philosophers to Persia, to the school of Gundi-Sapur that was established by the Persian king Chosroes I. There he remained for two years (531–32); but after a treaty of peace was signed between the Byzantine state and the Persians, he returned to the empire with guarantees that he would not be compelled to leave against his will, as Agathias tells us (*History*, 2. 31. 4).

The earliest preserved work of Simplicius is his commentary on Epictetus' *Enchiridion*, written after 529, for he refers to "tyrannical circumstances" (*Enchiridion*, 138. 17–19). He wrote a series of influential commentaries on Aristotelian works after his stay in Persia, in which he endeavoured to harmonize and reconcile Aristotle and Plato. His first commentary was on *De Caelo*, followed by *Physics*, and finally *Categories*. The authenticity of a fourth commentary, on *De Anima*, preserved under the name of Simplicius, was questioned as long ago as the 17th century and is nowadays regarded as spurious. The first Latin translations of his commentaries by William Moerbeke appeared in 1266. The complete Greek text was published in the *Commentaria in Aristotelem Graeca* series of the Berlin Academy between 1882 and 1907.

Another question relates to where Simplicius wrote his commentaries. Although it has been suggested that he composed them at Athens or Alexandria where he would have had access to the libraries, modern scholars such as H. Hadot propose Harran, a city in Mesopotamia where Hellenism remained active and powerful, situated close to the Persian border, 30 km from Edessa.

Simplicius' commentaries are a very helpful source for later scholars because they include accurate information about earlier works that have since been lost. For example, his commentary on *De Caelo* (264. 25) tells us of Hipparchus' attempt to justify forced motion with the earliest version of impetus theory. Simplicius' contribution to this problem was outstanding for, although he was himself influenced by Aristotle, he incorporated his objections to the Aristotelian view. He discusses forced motion in his commentary on *Physics* (1348. 36–1351. 13), where he introduces his objections to the pure Aristotelian interpretation with some questions. These questions show that he did not fully accept Aristotle's view of the propelling role of air during forced motion and that he preferred to invoke physical causes as being responsible for a projectile's propulsion. In conclusion, we can say that Simplicius' attempt to interpret forced motion was a cautious one. Meanwhile his contemporary John Philoponus introduced a radical theory for it.

John Philoponus was a Christian Neoplatonist of the 6th century. Simplicius seems to have been a little older than Philoponus (he calls him a "young man" in *In De Caelo*, 42. 17) and he informs us that they did not meet. It seems that a major difference arose between these two great commentators that centred on their different religious beliefs, for Simplicius was not a Christian while Philoponus was (or became one during his lifetime). This difference strengthened after 529, a turning point in the history of ideas. It was the year in which the school of Athens (which Simplicius attended) was closed by Justinian, and Philoponus wrote the essay *De Aeternitate Mundi* that indicates his return to Christian belief. Simplicius was strongly opposed to the principle asserted by Philoponus regarding the origin of the world through divine creation. Nor did Simplicius accept the linear conception of time that sprang from Philoponus' view of a beginning point for the creation of the cosmos, but instead he asserted a cyclical conception for it.

Sinope

City on the north coast of Asia Minor

Sinope is the most northerly point on the Pontic coast of Asia Minor, lying west of the river Halys. On a coast which afforded little shelter, it was praised from at least the time of Strabo for its harbour, a double bay divided by an isthmus on which the city itself stood. In later periods storm-driven travellers were grateful for its haven. These included the Trapezuntine *archon* (governor) of the Crimea in the 13th century, the great Arab traveller Ibn Battuta and bishop Ignatios of Smolensk in the 14th century, Vincenzo Alessandri, the Venetian ambassador to Persia, in the 16th century, and the patriarch of Antioch, Makarios, in the 17th century. From antiquity to early modern times, links with the Chersonese (Crimea) were important, as well as coasting traffic in indigenous products such as timber, iron, and the arsenical compound *miltos* (Sinop red, cinnabar, realgar) for dyeing, while its fish, especially tunny and mullet, were celebrated.

Sinope has traditionally been seen with Trebizond as a colony of Miletus established in the 7th century BC. In recent times an 8th-century date has been proposed and Corinth is credited with its foundation. Perhaps there was a refoundation after the Cimmerian incursion of the early 7th century. From the 6th century connections with Athens were strong, especially after the visit of Pericles about 436/35 which saw the establishment of 600 Athenian settlers at Sinope. Herodotus remarked on its position on the trans-Anatolian route to Cilicia. The coins of Sinope, which circulated widely in the Pontus, typically have the head of the nymph Sinope and an eagle and dolphin. Diogenes the Cynic was a native of Sinope, where his father was a moneyer. Trade with Colchis flourished, as roof tiles and amphorae from Sinope found there show. Sinope provided the ships and supplies for the return voyage of Xenophon and the survivors of his 10,000. After a period under Persian overlordship in the 4th century, Sinope became part of the kingdom of Pontus in 183 BC. King Mithridates V was murdered at Sinope but his son and successor Mithridates VI Eupator (120–63 BC) embellished its buildings and restored its walls. Sinope fell to the Romans under Lucullus and Pompey (the former displayed sculptures looted from Sinope in his garden) and in 45 Julius Caesar renamed the city, which became Colonia Iulia Felix. Under Trajan, Pliny the Younger surveyed the area and built an aqueduct.

In legend St Andrew evangelized Sinope, but in fact the cult of St Phocas, reputedly its first bishop, eclipsed that of the apostle. The 2nd-century heresiarch Marcion was a shipbuilder in Sinope before, it is alleged, his father (who was a bishop) excommunicated him for immorality. East of Sinope at Çiftlik a large basilica with a fine mosaic in a 4th-century style has recently been discovered.

After some rebuilding in the 6th century by Justinian I, centuries of decline followed, culminating in the taking of the city by the Turks about 1081. The newly established empire of the Grand Komnenoi of Trebizond recovered the city for the Greeks from about 1204 to 1214, when it fell to the Seljuk Turks. Its capture enabled the sultan to claim among his titles "Lord of the two Seas", for the Seljuks now had access to the northern as well as to the southern shores of Anatolia. The Seljuk period saw further rebuilding under the direction of a Greek called Sebastos, commemorated in a bilingual Arab/Greek inscription which survives. Genoese and Venetian merchants increasingly frequented its harbour. Perhaps the most intriguing episode in the period is the assault by Ghazi Çelebi on Genoese shipping in the harbour which was attacked by swimming underwater to hole the vessels. Çelebi's tomb is still to be seen. In 1324 Sinope was taken by the emirate of Kastamonu and in 1461 by the Ottomans. Some of the town's Jewish community moved to Istanbul. An attack by Russia on the Turkish fleet at Sinope in 1853 precipitated the Crimean War (1853–56). The wrecks of the Turkish vessels were reportedly still a hazard to shipping at the end of the 19th century.

Sinope retains traces of its Hellenistic gridiron plan and the remains of the Hellenistic temple of Serapis. The museum has sarcophagi, altars, and jewellery from antiquity, some late icons, and a very representative sequence of coins. The ruinous building known as "Mithridates' Palace" is Roman, perhaps a

Sinope: the walls are mainly Byzantine but incorporate both earlier and later work

bath complex. Its walls, so often attributed to the Genoese, in reality incorporate work of almost every other phase from Hellenistic to Ottoman.

The "Sinope Gospels" are a copy of St Matthew's gospel written in gold uncials on purple vellum with a number of miniatures. They date perhaps to the 6th century. The manuscript was bought from an old Greek woman in Sinope in December 1899 by a French officer and is now in the Bibliothèque Nationale.

The title of duke of Sinope was taken by Konstantinos Ioannes Alexios Laskaris-Komnenos who was born in Saragossa in 1923, the second son of prince Eugenios Laskaris-Komnenos, a claimant to the Greek throne. Prince Konstantinos was professor of philosophy in the National University of Costa Rica.

Summary

A city on the Black Sea coast of Anatolia, Sinope was first colonized by the Greeks in the 8th or 7th century BC. It had strong connections with Athens. Its excellent harbour made it a focus for trade. In the 2nd century BC it formed part of the kingdom of Pontus before falling to Rome. It was taken by the Seljuks in 1081, was briefly Byzantine again *c.*1204–14, and Ottoman from 1461.

Skalkottas, Nikolaos 1904–1949

Composer

The author of more than 110 finely crafted musical works, Nikolaos Skalkottas is generally considered to be one of the outstanding Greek composers of the 20th century. He was born on 8 March 1904 in the town of Chalcis to a family with a strong musical tradition. His great-grandfather Alekos had been a famous folk musician, while both his father and his uncle Kostas were instrumentalists in the town band. When Nikolaos was 2 years old the family moved to Athens, where his uncle began to teach him the violin in 1910. Four years later he enrolled in the Athens Conservatory, graduating in 1920 with a diploma in violin and a gold medal. An Averoff scholarship for study abroad enabled him to continue his violin studies in 1921 with Willy Hess at the Hochschule für Musik

in Berlin. Despite continuing success as a violinist, Skalkottas was increasingly drawn towards composition, which he began to study under a distinguished succession of teachers beginning with Paul Juon, Robert Kahn, and Kurt Weill. During this period he produced his first surviving works, a jazz-influenced *Greek Suite* for piano (1924) and an atonal *Sonata* for solo violin (1925). Overruling the protests of Hess, in 1925 Skalkottas renounced his aspirations for a career as a solo violinist in order to concentrate on composition. For the next two years he studied under Weill's teacher Philipp Jarnach while continuing to support himself with work as a pianist in bars and cinemas.

Shortly after switching to the tutelage of Arnold Schoenberg in 1927, Skalkottas received an Emmanuel Benaki scholarship (1928–31) that enabled him not only to refine his personal style of atonal composition, but also to direct his works at the Singakademie and collaborate with other students in performances of modern chamber music. Schoenberg came to think highly of his Greek pupil, later listing him as one of his few students worthy of the appellation "composer". Meanwhile, Skalkottas's artistic productivity was complemented by a happy personal life centred around cohabitation with the violinist Mathilde Temko, with whom he produced two children (only one of whom survived). Outside the home, he was popular with his fellow musicians, among whom were a significant group of Greek expatriates that at various times included the pianists Marika Papaionannou and Spyros Farantatos, the singers Tito Xirellis and Kostas Mylonas, and the composers Yiannis Konstantinidis and Dimitri Mitropoulos, whose piano piece *Fête crétoise* Skalkottas orchestrated in 1928. He further refreshed his ties with Greece during a brief visit that featured his inauguration of the 1930–31 season of popular concerts in Athens with a performance of his *Concerto for Wind Orchestra* (1929).

The year 1931 was marked for Skalkottas by a series of traumatic events: his departure from Schoenberg's circle, the conclusion of his relationship with Temko, and the end of his scholarship. He composed little during a subsequent period of depression (1932–34), which permanently introverted his formerly sociable personality. In the wake of Hitler's rise to power, Skalkottas left Berlin in May 1933 – the very month of Schoenberg's flight from Nazism – and returned to Athens, leaving behind the scores of his musical works together with most of his possessions. For the remainder of his life he toiled in relative obscurity as a back-desk violinist, initially for the State Orchestra of Athens, and later for the orchestras of the National Opera and Greek Radio. Interestingly, however, Skalkottas's misfortune coincided with a renewal of his interest in Greek folk music. In 1931 and 1932 he produced a few tonal settings of folk songs for voice and piano, while after his arrival in Athens he transcribed a body of Cretan songs for the ethnomusicologist Melpo Merlier. Working with her provided Skalkottas with access to the raw material for his most enduringly popular work, the *36 Greek Dances* for orchestra (1933–36, with later reorchestrations and arrangements). Elements of folk music continued to surface occasionally after 1935 as he returned forcefully to composing atonal orchestral and chamber music in a dense polyphonic style, employing both free atonality and ingenious variations on Schoenberg's method of 12-tone composition. Yet the advent of his most prolific period, during which he wrote many large-scale works in the traditional genres of western art music, passed almost without notice. Faced in Greece with indifference and even hostility towards his progressive music, he composed in radical isolation a substantial body of work that remained mostly unperformed and unknown at the time of his death.

Although World War II brought him such additional hardships as two months in a German prison camp, Skalkottas continued to develop musically, reaching an impressive level of formal complexity with the one-movement symphony *The Return of Ulysses* (1944–45). This massive work, which was originally conceived as the overture for a projected opera, deploys an astonishing 18 different 12-note rows in various combinations over the course of an extended essay in sonata form. In 1946, the year of his marriage to Maria Pigali, Skalkottas entered a new creative phase characterized by greater textural transparency and a partial return to tonality. Shortly before the birth of his second son, however, on 19 September 1949 he died unexpectedly of an untreated hernia.

Without neglecting his musical heritage, Skalkottas was the second Greek composer after Mitropoulos to eschew the musical folklorism of Kalomiris and the National School in favour of a direct confrontation with European modernism. Yet his little-known music exercised only a marginal influence on Greece's post-World-War-II generation of composers, whose more adventurous members were inspired directly by the contemporary international avant-garde. Devotees of Skalkottas's music nevertheless succeeded in establishing an archive of his scores in Athens, while various efforts have been made both in Greece and abroad to perform and record his works. The harpsichordist Maria Lalandi was a particularly successful advocate, organizing numerous overdue premières within the context of the English Bach Festival she cofounded in 1963. Most recently a project has been initiated by Margun Music of Newton, Massachusetts, to publish critical editions of the complete works of Skalkottas.

ALEXANDER LINGAS

Biography

Born in Chalcis in 1904, Skalkottas studied violin at the Athens Conservatory and then at the Hochschule für Musik in Berlin. Turning to composition, he became a pupil of Arnold Schoenberg in 1927. In 1933 he returned to Athens where he supported himself as a violinist but continued to compose. He died suddenly in 1949.

Skopje

City in Macedonia

The city of Skopje lies along the Vardar river in mountainous country on the north–south route between Thessalonica and Belgrade at a distance of 320 km from Belgrade. The valley near Skopje is flanked by the Sar Planina mountain range, which extends into Thessaly east of Trikkala. In the Roman period the town was called Scupi, an outpost town, which would eventually become the capital of the district of Dardania in the 4th century AD. In AD 518 two events occurred that altered the town's location and name: barbarians sacked it and a disastrous earthquake struck. The town was rebuilt on the Vardar river and given its Slav name of Skopje, which is said to be derived from the Greek word for "episcopal". To this day, many Skopjans and Macedonians deny any significant cultural debts to Hellenism or neighbouring cultures. Linguistic, archaeological, and historical evidence, however, affirms strong Hellenic cultural influence in the Skopje area.

Linguists have traced the influence of Greek over three millennia. As early as 900 BC the area was known to be Greek-speaking. The word "Macedonian" can be traced to the Greek "Makedones", high (tall people) or highlanders. The debate is particularly focused on what language(s) inhabitants of the Skopje area spoke. The Macedonian alphabet, primarily Cyrillic, was established as a language in May 1945, and the first primer appeared in 1946 from the University of Skopje. Others debate the extent to which Macedonian is a dialect of Greek. Since the early 19th century, linguists (H. Ahrens, O. Hoffman, G. Buck, J. Chadwick, and G. Babinoitis) have considered the Macedonian language a form of pre-stage Greek, or a dialect related to northwestern ancient Greek.

Artefacts collected from the Skopje area provide evidence of Hellenic cultural continuity. Archaeological finds housed at the museum in Skopje date from the Neolithic period with artefacts such as the "Great Mother". Habitation continued through the Iron Age (1050–650 BC). The Skopje Museum's collection of substantial Hellenistic artefacts, as exemplified by figures such as *Dionysius the Laurel Bearer*, from the 1st century BC, attests to Greek cultural influences. Recent archaeological excavations have revealed more than 5000 inscriptions in Greek on grave stelae and votive offerings. Coinage and sanctuaries dedicated to the 12 Olympian gods supply evidence of Greek influence in Skopjan Macedonia, even when allowing for cultural distinctions.

Historical documents confirm the Hellenicity of the Skopje area and Macedonia. Thucydides (2. 99) wrote that the Macedonian state was founded in the 7th century BC. The historian Polybius documented flourishing Greek culture between 280 and 160 BC. He recognized the importance of Macedonian cooperation with the Greeks: "The Greeks would be for ever the greatest danger, if we did not have as a bulwark the Macedonians and the ambition of their kings."

The inhabitants of the area, as Macedonians, have claimed ancestral links in turn with Illyrians, Dorians, Thracians, Dardanes, and Paenones. The ancient royal house is traditionally said to be derived from Argive origins when descendants of Temenus and Heracles migrated and ruled as a Macedonian dynasty up to the 4th century BC (Thucydides, 2. 99). Herodotus (5. 22) affirmed that the Macedonian tribes were of Greek descent: "And the people originating from Perdiccas are Greeks". Some question the Hellenicity of Macedonia because Demosthenes labelled Philip a barbarian. From this antique name-calling, it was presumed that Macedonians were non-Hellenes. This presumption does not take into consideration the fact that the word could refer merely to an uncultivated person. Plutarch (*Life of Aratus*) called the Macedonians *allophyloi* (foreigners); but Alexander the Great's ardent support and exportation of Hellenism during his reign is evident.

Skopje's history reflects the sociopolitical movements that affected much of Europe from Byzantium until the Ottoman occupation and the 20th-century reorganization. Skopje was close to the birthplace of the emperor Justinian (527–65). The Serbs took Skopje in 1189, and the coronation of Stephan IV Dushan, emperor of the Serbs, took place here in 1346. The Ottoman Turks held control from 1392 to 1912. In 1913 Skopje was again incorporated into Serbia and from 1918 was under the control of Yugoslavia. German troops occupied Skopje from 1941 until its liberation in 1944. After World War II the Socialist Federal Republic declared Skopje to be the capital of Macedonia. An earthquake struck the city on 26 July 1963, causing over 1000 fatalities and leaving more than 120,000 homeless. As a result 80 per cent of Skopje's infrastructure had to be rebuilt, depriving the city of much of its Turkish character.

Macedonian nationalism and ethnogenesis continue to play a powerful role in Skopje. In 1968 the independent Macedonian Orthodox Church was founded in Skopje. This Church remains unrecognized by the patriarchates of Constantinople and Serbia. In 1977 two Skopje citizens, Lazar Krajnichanes and Angel Miterev, were sentenced to five years' imprisonment for asserting that Macedonians were Bulgarians. Sporadic trials of those who resist the notion of an ethnically pure and long-lived Macedonian nation continue. Skopje's population today is about 500,000.

Summary

The capital of the Former Yugoslav Republic of Macedonia, Skopje was known to the Romans as Scupi. It became the capital of the district of Dardania and was the birthplace of Justinian. Skopje was taken by the Serbs in 1189. From 1392 to 1912 it was part of the Otroman empire. In 1918 it was incorporated in Yugoslavia.

Slavery

Slavery was apparently known already in Mycenaean times, but it is not quite clear to what extent the Mycenaean *doero* meant the same condition as the Greek word *doulos*. Various kinds of unfree people are also to be found in Homer: prisoners of war, women as booty of war, domestics, and servants in agriculture. The origins of slavery lay probably in war and/or indebtedness; the occurrence of the latter greatly increased after about 600 BC, when money was introduced and trade and business expanded. A real slave trade seems to have been established first in eastern Greece and the areas bordering on northern and eastern barbarian countries; from there it quickly spread to commercial centres such as Athens, Corinth, and Aegina. From the 5th century BC onwards, slavery was an established social institution in Greece, and the laws of this institution were (with minor local variants) more or less the same everywhere. A slave was the property of his master and could be sold and bought like cattle; the price (between a half and ten *minae*) depended on his skills and his physical condition. Slaves toiling in workshops, at public buildings, in mines, etc. received the same salary as free workers and could eventually buy their freedom. They had no political rights, but were in some measure protected by the law; they were allowed to marry and have their own money. In Athens a stranger was not allowed to mistreat or beat a slave who was not his property. Slaves often retained the cults of their native countries; in Athens they were even allowed to take part in the mystery cults.

In Classical Greece slaves were mostly "barbarians", including many from Asia Minor, but also Thracians and Scythians; trading places in the Black Sea and cities such as Byzantium and Ephesus were big suppliers of slaves for Greece. Grave stelae, lists of slaves in the Athenian fleet, lists of the workers on the Athenian Acropolis, and inscriptions of slaves who bought their freedom at Delphi show a wide range of countries from which slaves came: Egypt, Caria, Illyria, Lydia, Mysia, Paphlagonia, Persia, Phoenicia, Phrygia, Syria, and others. Pseudo-Aristotle's *Oeconomica* gives the telltale advice not to have too many slaves from the same nation (ch. 4).

The circumstances that brought people into slavery are not always clear; a great number of them were certainly prisoners of war; armies must have been one of the most important sources of supply in Greece (during his invasion of Scythia in 339 BC Philip II of Macedon enslaved and sold 20,000 women and children). Slave traders apparently accompanied armies on their campaigns and instantly bought prisoners as well as other booty. Sometimes barbarian tribes even seem to have exchanged their own people against urgently needed goods; the sentence "You are a noble Thracian, sold for salt" (Menander, fr. 891 Kassel-Austin) was proverbial in Greece. Another source was piracy, which reached a peak in the middle of the 4th century BC (in 334/33 BC the general Diotimus was honoured in Athens for his fight against pirates). The Attic slave trade was centred in Athens and Sunium, the harbour of which played an important role in the import of goods since the beginning of the 5th century BC; from there the slaves could be brought directly into the silver mines of Laurium.

In the ancient world a slave could work in every kind of profession, not just as "mean slave labour"; there were slave doctors, stonemasons at official buildings, soldiers, enterpreneurs, wetnurses, teachers, musicians, artisans (potters and painters), etc. Household slaves made up the majority of the slave population in Greece; considerable numbers were also employed in agriculture. In Athens minor public positions (the police among them) were filled by slaves; these so-called "state slaves" had a salary and their own dwelling. Astonishingly, the police in Athens consisted of Scythians, who were famous for their skills as archers; several times Aristophanes makes fun of them as stupid, stammering, and randy barbarians. State slaves able to write and calculate were also used in the army; if they were killed in action, they were given a state funeral like free citizens, and the survivors were often set free. The many slaves working in the silver mines were an important factor for the Athenian economy; often they were not the property of the state (who owned the mines), but were hired in groups from private masters (the Athenian general and politician Nicias cleverly employed such slave groups to further his own income). Some of these people must have been highly specialized to do the more difficult work (probably they had already been imported as skilled workers from countries such as Thrace and Paphlagonia which were also renowned for their mines), and they at least had a chance of rising to the post of an overseer; for the great majority, however, working in the mines was by far the worst, most horrible, and most humiliating fate (in this manner the Athenian army captured in Sicily in 413 perished in the quarries of Syracuse). Still, several grave stelae and votives (mostly for gods of Asia Minor and Thrace) found in Laurium show that it must have been possible even

for these people to preserve something of their own life and their native cults.

Serving as nurses and pedagogues was another important "profession" of ancient slaves; in Classical Athens Thracian wetnurses seem to have been very popular. From the middle of the 4th century BC on, numerous grave stelae and grave epigrams were dedicated for nurses by their foster children and their families, often containing the same laudatory epithets as for their next of kin. It is remarkable that the Greeks entrusted their children to barbarian slaves and gave them duties with so much responsibility.

It is still an unsolved question how many slaves lived in Classical Attica (assessments range from one quarter to half of the whole population), to say nothing about other regions; it is also disputed how many slaves lived in an average Greek household, as ancient evidence on this question is almost completely lacking. Still, some remarks in comedies of Aristophanes seem to show that a "normal" citizen had at least one slave; even the poor farmer Chremylus has one (*Plutus*, 253ff.), as do the birds (*Aves*, 70, 1579f.), and to have none means utmost poverty for Praxagora (*Ecclesiazusae*, 593). A middle-class family may have had between three and twelve slaves, but this number certainly varied according to place and epoch. In the later 5th century BC there must have been a considerable number of slaves in the silver mines of Laurium, for according to Thucydides (7. 27. 5) 20,000 of them went over to the enemy after the Spartans occupied Deceleia in 413 BC. Compared with other Greek states, Classical Athens (with its leading role in the Delian League) may have had the largest proportion of slaves in relation to its citizens; in any case they always held an important place in the economy.

From the later 5th century onwards, Greek thinkers developed something like a theoretical concept of slavery. Its institution was usually justified by the notion that barbarians were slaves by nature because they had no political institutions for free and equal citizens and because the monarchies in which they often lived were themselves a kind of slavery; therefore, as Euripides put it (*Iphigeneia at Aulis*, 1400f.), "it is right that Greeks rule over barbarians". The thesis of barbarian inferiority and a legitimate Greek claim of dominion over them is also found in Aristotle (who reportedly advised Alexander the Great to treat barbarians like animals and plants), Isocrates, and Plato, who outlined precise laws of slavery in his *Laws*. These sources, of course, primarily reflect political tendencies after the Persian Wars and do not necessarily tell us how slaves were perceived or treated in reality; many grave stelae with touchingly personal inscriptions were set up for loyal slaves and faithful nurses by their masters and show that their relationships were more complex in the real world than in philosophical theory. The Sophists and later the Stoics and Cynics declared that all people were equal and free by nature, and noble slaves can also be found in the plays of Euripides; even the slaves themselves, however, apparently did not question the institution of slavery and had no "class-consciousness" of their own.

In Hellenistic times new areas of trade and new markets (e.g. Delos) led to an increase of slavery; the legislation concerning slavery saw new developments (taxation of slave trade, intensified search for runaway slaves, but also extended asylum rights). Menander's comedies show that there was often a very familiar relationship between master and slave.

During the Roman empire mass enslavement of free people (as a consequence of wars and conquests) increased; but slave revolts (among other places in Attic mines and on Delos) remained unsuccessful. Many Greek slaves (and freedmen) worked in the imperial household and held important administrative posts. The sources (among others Libanius, Justinian's law corpus, Egyptian papyri, the letters of Sidonius Apollinaris) show that slavery was still an important factor in the economy of the late Roman empire; in Byzantine law, slaves still had almost no civil rights, but at least the intentional killing of a slave was now treated as homicide.

The Church's attitude to slavery was ambiguous: while some (e.g. Gregory of Nazianzus) condemned it, others (e.g. Basil the Great) tolerated it as a necessary evil. The Church (following St Paul) usually pointed out that slaves and free men alike were servants of Christ, so that worldly freedom was irrelevant; nevertheless, Christian masters were advised to treat their slaves as brothers.

There are only a few sources about slavery in Byzantium between the 7th and the 9th centuries AD; during the 10th century slavery apparently expanded once more. After the victories of Nikephoros II Phokas (963–69) numerous prisoners of war were to be found in Byzantine households and fields. A great number of slaves then worked above all in the imperial workshops and in the establishments of goldsmiths and silk weavers of Constantinople. From the 12th century on, slavery declined; and in the 13th century it largely vanished. A new increase followed the fall of Constantinople in 1453, but slavery in Muslim countries was very different from that in the ancient and Byzantine world, because slaves in the fields, industry, or mines were almost unknown; nearly all of them were employed in rich families and usually well treated. In the Ottoman empire slavery was abolished rather late, so that the final end of slavery in Greece itself came only with the wars of liberation.

Slavs

According to the 6th-century historian Procopius Slav incursions into Byzantine territory began in the reign of emperor Justinian I (527–65) whose policy of expansion had clearly strained the resources of the empire. A number of ancient sources confirm that these invasions grew more frequent and severe in the last quarter of the 6th century, although there is disagreement among modern historians about their nature, extent, and duration. It is fairly clear that the Slavs, themselves Indo-European speakers, were dominated by non-Indo-European speakers such as the Avars and Bulgars, although it was the Slav language which eventually prevailed. Although there are references to invasions of Hellas, this was an elastic term. The evidence of proper names suggests that there were more Slavs in western than in eastern Greece. The Slavs did reach the Peloponnese and there were Slavonic tribes – the Ezeritae and Melingi – there as late as the 13th century. The *Chronicle of Monemvasia* with unusual precision says that the Peloponnese was occupied for 231 years after an Avar invasion of 581, but the authority of this chronicle has been doubted by Greek historians anxious to prove the continuity of Greek occupation, for which the survival of the Greek language provides some testimony. Pointing to the Slav domination by the Avars, they like to think of the Slavs as peaceful, pastoral immigrants, fairly rapidly absorbed by the surviving Greek population.

By the 9th century some kind of absorption had begun in southern Greece, but in the north Slav tribes more naturally fell under the powerful sway of the Bulgarian kingdom. The activities of Cyril (St Constantine) and Methodios in inventing the Cyrillic script and the establishment of a separate Bulgarian Church, though civilizing influences, were an obstacle to the work of the Greek Church in re-establishing Greek. Bulgaria was defeated at the beginning of the 11th century and once again Byzantium ruled the Balkans, but in this multilingual empire Slav-speakers dominated in the north and central Balkans, and there were still pockets of them further south.

With the collapse of Byzantine authority after the Fourth Crusade (1204) the Serbs and Bulgars reasserted their independence and occasionally occupied northern and central Greece. The turbulent two centuries until the Ottoman invasion produced many movements of population, Latins, Vlachs, and Albanians all adding to the racial mix of Slav and Greek, and nationalist advocates of ethnic purity or continuous occupation would find it difficult to make sense of these years. The Ottomans were not particularly interested in the ethnic composition of their subject populations, but the long years of Turkish rule did something to restore the balance of Greek against Slav, since Greek was the language of the Church, of commerce, and of education.

It was not until 1870 that the Ottoman authorities sanctioned the founding of the Bulgarian Exarchate and did something to tilt the scales yet again. By this time, apart from some pockets of Greeks or Greek-speaking Vlachs in towns of the central Balkans, the boundary between Greek speakers and Slav speakers stood slightly to the south of the present northern Greek frontier. For the next 40 years Greeks and Bulgars fought a guerrilla campaign with each other and the Turks over the disputed territory. The battle was largely fought in religious terms between exarchists, supporters of the Bulgarian Church, and patriarchists, supporters of the Greek Church. The Serbs were rarely in competition with the Greeks, but as a result of being on the winning side in the Second Balkan War, it was the Serbs who were awarded the territory which now calls itself Macedonia, while Greece gained a large section to the south which confusingly they too call Macedonia. Both areas contained large numbers of people speaking a Slav language akin to Bulgarian.

After World War I, in which again Greece and Serbia were on the winning side and gained territory from Bulgaria as a result, the problem of the Slav-speakers in Greece was solved in a number of ways. There was a series of population exchanges involving Greek-speakers from Bulgaria replacing Bulgarian-speakers in Greece. The much larger exchanges between Turkey and Greece resulted in the population of

Macedonia becoming much more Greek. Assimilation was encouraged and the speaking of the local Slav dialect discouraged. During World War II part of northern Greece was occupied by the Bulgarians and in the Civil War the communist forces had a considerable Slav-speaking element: the defeat and consequent unpopularity of first the Bulgarians and then the communists cannot have helped the Slav cause.

Nevertheless in 1951 the Greek census included 41,017 Slav-speakers and 18,671 Pomaks, Slav speakers near Xanthi who had adopted Islam and in subsequent censuses are recorded as Muslims. Slav-speakers were not recorded as such after 1951 on the grounds that assimilation was likely to take place very rapidly. In the 1970s and 1980s, with relations between Greece and Tito's Yugoslavia fairly amicable, it was possible to find Slav-speakers near Florina chatting with their counterparts near Bitola as they made social or shopping visits to the other country, but with the dismemberment of Yugoslavia and the independence of the Former Republic of Macedonia the Slav-speakers of Greece have again become a topical issue. Their numbers are clearly not great, but minorities all over Europe are the cause for controversy and concern. Greeks see the name Macedonia and the existence of the Slav-speakers as a threat to their northern borders. Such a threat, present at the time of the Civil War and in the Cold War that followed it, is hardly very potent now, but it has affected the attitude of Greeks to the history of the Slavs and to Slav-speakers in Greece.

Smyrna

City in western Asia Minor

The first ancient Greek settlement of Smyrna was founded in about the 10th century BC on the northeastern shores of the gulf of Smyrna, in what is now the modern Izmir suburb of Bayrakli. Aeolian Greek migrants established their colony here on the site of an earlier Anatolian settlement, but were soon themselves displaced by Ionian Greeks. From this time on Smyrna was considered part of Ionia, though it was not incorporated into the Panionium, or organization of the original 12 Ionian colonies, until the 3rd century BC, following the refoundation of the city. Fortified by at least the 9th century BC, Old Smyrna boasted a fine archaic temple of Athena. It was most famous, however, for its claim, strongly contested by neighbouring Chios, to be the birthplace of Homer. Indeed, still today, Classical scholars generally agree that the Homeric poems underwent their early development in the Smyrna-Chios region: the mixed Ionic-Aeolic dialect of the poems belies their origin in this part of the Greek world, as does also their description of the topography of the Smyrna region. The ancient tradition linking Homer and Smyrna proved to be long-lived and widespread across the Hellenic world: Aristotle, Pindar, Aristides, and Dio Chrysostom, among others, all mention Homer's Smyrnaean roots. By the 2nd century BC coins of Smyrna could be identified by their pictorial device of the seated figure of Homer, shown together with his name. At the turn of the 1st century BC–1st century AD Strabo also details the existence of a Homereion, or shrine to Homer, in the refounded city of Smyrna.

The first Greek city of Smyrna at Bayrakli grew and prospered until *c.*600 BC, when it suffered destruction at the hands of the powerful Lydians. It was never to recover from these destructions, and declined further throughout the Classical period, until by the late 4th century BC it lay more or less abandoned. At this time the second Greek city of Smyrna was founded on the slopes of Mount Pagus, on the opposite (southeastern) shores of the Smyrnaic gulf. The refoundation of the city can perhaps be attributed to Alexander the Great, or alternatively to Antigonus I and Lysimachus. It is this site, gradually and considerably enlarged over the centuries, which has remained in continuous urban use until the present day. Fortified from the beginning, the new city soon prospered and, during the Hellenistic period, attracted the interest of both the Seleucids and the Attalids, to whom it reacted with vacillating loyalty. The increasing power of Rome further served to increase Smyrna's prosperity and prestige as it emerged as one of the major cities of the Roman province of Asia, well placed on routes of trade and communication and functioning as a Roman administrative centre. As such it was graced with many fine public buildings, and Strabo claims it to be the most beautiful Roman city of his day. In AD 178, however, disaster struck in the form of a powerful earthquake, which resulted in grave damage to the city and necessitated much rebuilding. The imperial favour and generous benefactions of Marcus Aurelius, nevertheless, made this reconstruction work possible, the extant remains of the state agora still today bearing testimony to the suitably grand scale on which the refurbishments were carried out. By the mid-1st century AD Christianity seems already to have been established at Smyrna. From this point onwards, the city played a significant role in the development of the early Christian Church, a role perhaps recognized in the book of Revelation by the identification of Smyrna as one of the seven Churches of Asia. As elsewhere, the early Christian Church at Smyrna was subjected to much persecution, and in AD 155 Polycarp, bishop of Smyrna, was martyred.

Smyrna continued as a prosperous trading centre until the onset of the Arab raids in the 7th century AD. Towards the end of the 11th century the city fell briefly into the hands of the Seljuk Turks, until retaken by the Byzantines in 1097. Thereafter, for some 300 or so years, Byzantines, Crusaders, Genoese, and Turks all fought over it. In 1415 it was taken by

the Ottoman Turks and in 1472 was sacked by the Venetian fleet. However, for the most part, Smyrna during the Middle Ages, at least until 1600, had lost the wealth and importance which it had so enjoyed in earlier times. Nevertheless, by 1600 its fortunes were again changing with the establishment of French, Venetian, English, and Dutch factories and consulates in the city. Throughout the centuries which followed, Smyrna reasserted itself as one of the most dynamic and attractive mercantile centres in the Mediterranean, a position greatly assisted and enhanced by the arrival of the railway in the mid-19th century, a development which now linked the city effectively with the Anatolian hinterland. The trade and population of Smyrna expanded rapidly, particularly so in the case of the Greek element for, attracted by the growing wealth of the city, many Greeks migrated there from the islands and Greek mainland. While in 1800 the Greeks comprised under one-third of the city's total population, by the end of the century the figure had risen to almost half, thus giving them the status of the majority population. Even prior to this Hellenic population explosion, the growing wealth and influence of the Greek merchants in Smyrna had led to a revival of Hellenism in western Anatolia. This focused on the Evangelic School of Smyrna, which possessed a fine library of books and manuscripts, and which taught its pupils not only the ancient Greek classics but also a sense of pride in their language and national identity. This sentiment, naturally, was boosted by the 1821 revolt of the mainland Greeks against the Ottoman Turks, and the subsequent creation of the independent Greek state in the Western Aegean. Smyrna now became the lifeblood of Hellenism in the east.

The Smyrna Greek community was organized as a recognizable and, as far as possible, autonomous unit within the Ottoman system: not only its schools, but also its hospitals, were funded by the Greeks for the Greeks, and the community appointed its own representatives to handle its relations with the Ottoman state. All of this was subject to the authority of the bishop of Smyrna and, through him, to that of the ecumenical patriarch in Constantinople. For many decades this arrangement provided mutual benefits to both Asia Minor Greek and Turk. But in the early years of the 20th century, the Young Turk revolution and the First Balkan War undermined the symbiotic balance in Graeco-Turkish relations. Ethnic and religious differences were highlighted and came to be wielded by each side as blunt weapons against the other. World War I compounded matters further. Greece was courted for its participation in the war on the side of the Entente, in return for which Britain promised it territorial compensation on the coast of Asia Minor: the bait, of course, was Smyrna. In this offer Eleftherios Venizelos, prime minister of Greece, saw the ideal opportunity to incorporate the Asia Minor Greeks and their territory into the Hellenic state. When the war ended in September 1918, the victorious Allied Powers duly rewarded Greece for Venizelos's loyalty with the gift of Smyrna: in May 1919 Greek troops entered the city, a Greek High Commissioner was appointed, and the Greeks occupied a zone extending inland from Smyrna. This action provoked Turkish nationalist sentiments; these soon found a focus in Mustafa Kemal, a Turkish army officer who, establishing his base in Turkey's eastern provinces, set about organizing resistance to the occupation. In 1920 the signing of the Treaty of Sèvres brought the Ottoman empire to an end and granted the administration of Smyrna to Greece: if after a five-year period the local populace confirmed this arrangement to be acceptable, Smyrna would then be annexed to Greece. Beginning in June 1920, the Greek army had begun to advance northeast from Smyrna towards Ankara, its goal being to defeat Kemal's Turkish forces. The latter, however, proved too powerful, and in August 1922 the Greek front collapsed and the Greek forces retreated to Smyrna. Troops, civilians, and officials, including the Greek High Commissioner, fled Smyrna for the Greek islands and mainland, ahead of the advancing Turks. When in September the Turkish troops entered Smyrna, the pen stood poised to write one of the blackest pages in Hellenic history and memory. Archbishop Chrysostom, among others, was seized and killed by the angry Turkish mob, in an incident reminiscent of the martyrdom of bishop Polycarp almost 2000 years earlier. A few days after the death of Chrysostom a great fire swept through the city, destroying the Greek and other foreign quarters. Hellenic Smyrna, almost 3000 years in existence, was no more.

Following the Greek defeat, a Convention concerning the Exchange of Greek-Turkish Populations was signed by Greece and Turkey at Lausanne in January 1923. This provided for the compulsory exchange of the, now vastly reduced, Greek Orthodox population still remaining in Turkey, and the Muslim population of Greece. The resulting total of Asia Minor Greeks arriving in mainland Greece in 1922–23 numbered something approaching 1,500,000 refugees. Uprooted from their homeland, they attempted to recreate the familiar in their new surroundings: names such as Nea Smyrna and Menemeni still today identify suburbs in the mainland Greek cities which now became home to these eastern Greeks. With them they also brought their Hellenic Asia Minor culture, including a particular kind of oriental-style café music (*café aman*) and dance which greatly shaped the Greek *rebetika* (popular music) tradition. The influx of such a large number of refugees also made a profound contribution to Greece's interwar economic and political development: with their arrival, the pace of industrialization and agricultural mechanization quickened and the electoral outcomes of the period, too, reflect their considerable influence.

Modern Smyrna, rebuilt after the 1922 destructions as the bustling Turkish port of Izmir, is still regarded with great affection and nostalgia by the Greek people. A Greek consulate still survives today at Izmir, a lonely and isolated reminder of the long Hellenic contribution to the history of the city and of western Asia Minor.

Summary

Smyrna (modern Izmir, from Greek "I Smyrni") was first colonized by Greeks in about the 10th century BC. It claimed to be the birthplace of Homer. Destroyed by the Lydians *c.*600 BC, it was refounded in the early Hellenistic period on a different site and flourished. After a period of decline in the Middle Ages it prospered again after 1600 as a trading centre and many Greeks migrated there, making it once again a focus of Hellenism. In the break-up of the Ottoman empire it was given to Greece, but a Greek advance into the hinterland was

defeated in 1922 resulting in the destruction of Smyrna and the expulsion of its Greek population.

Socrates 470–399 BC

Philosopher

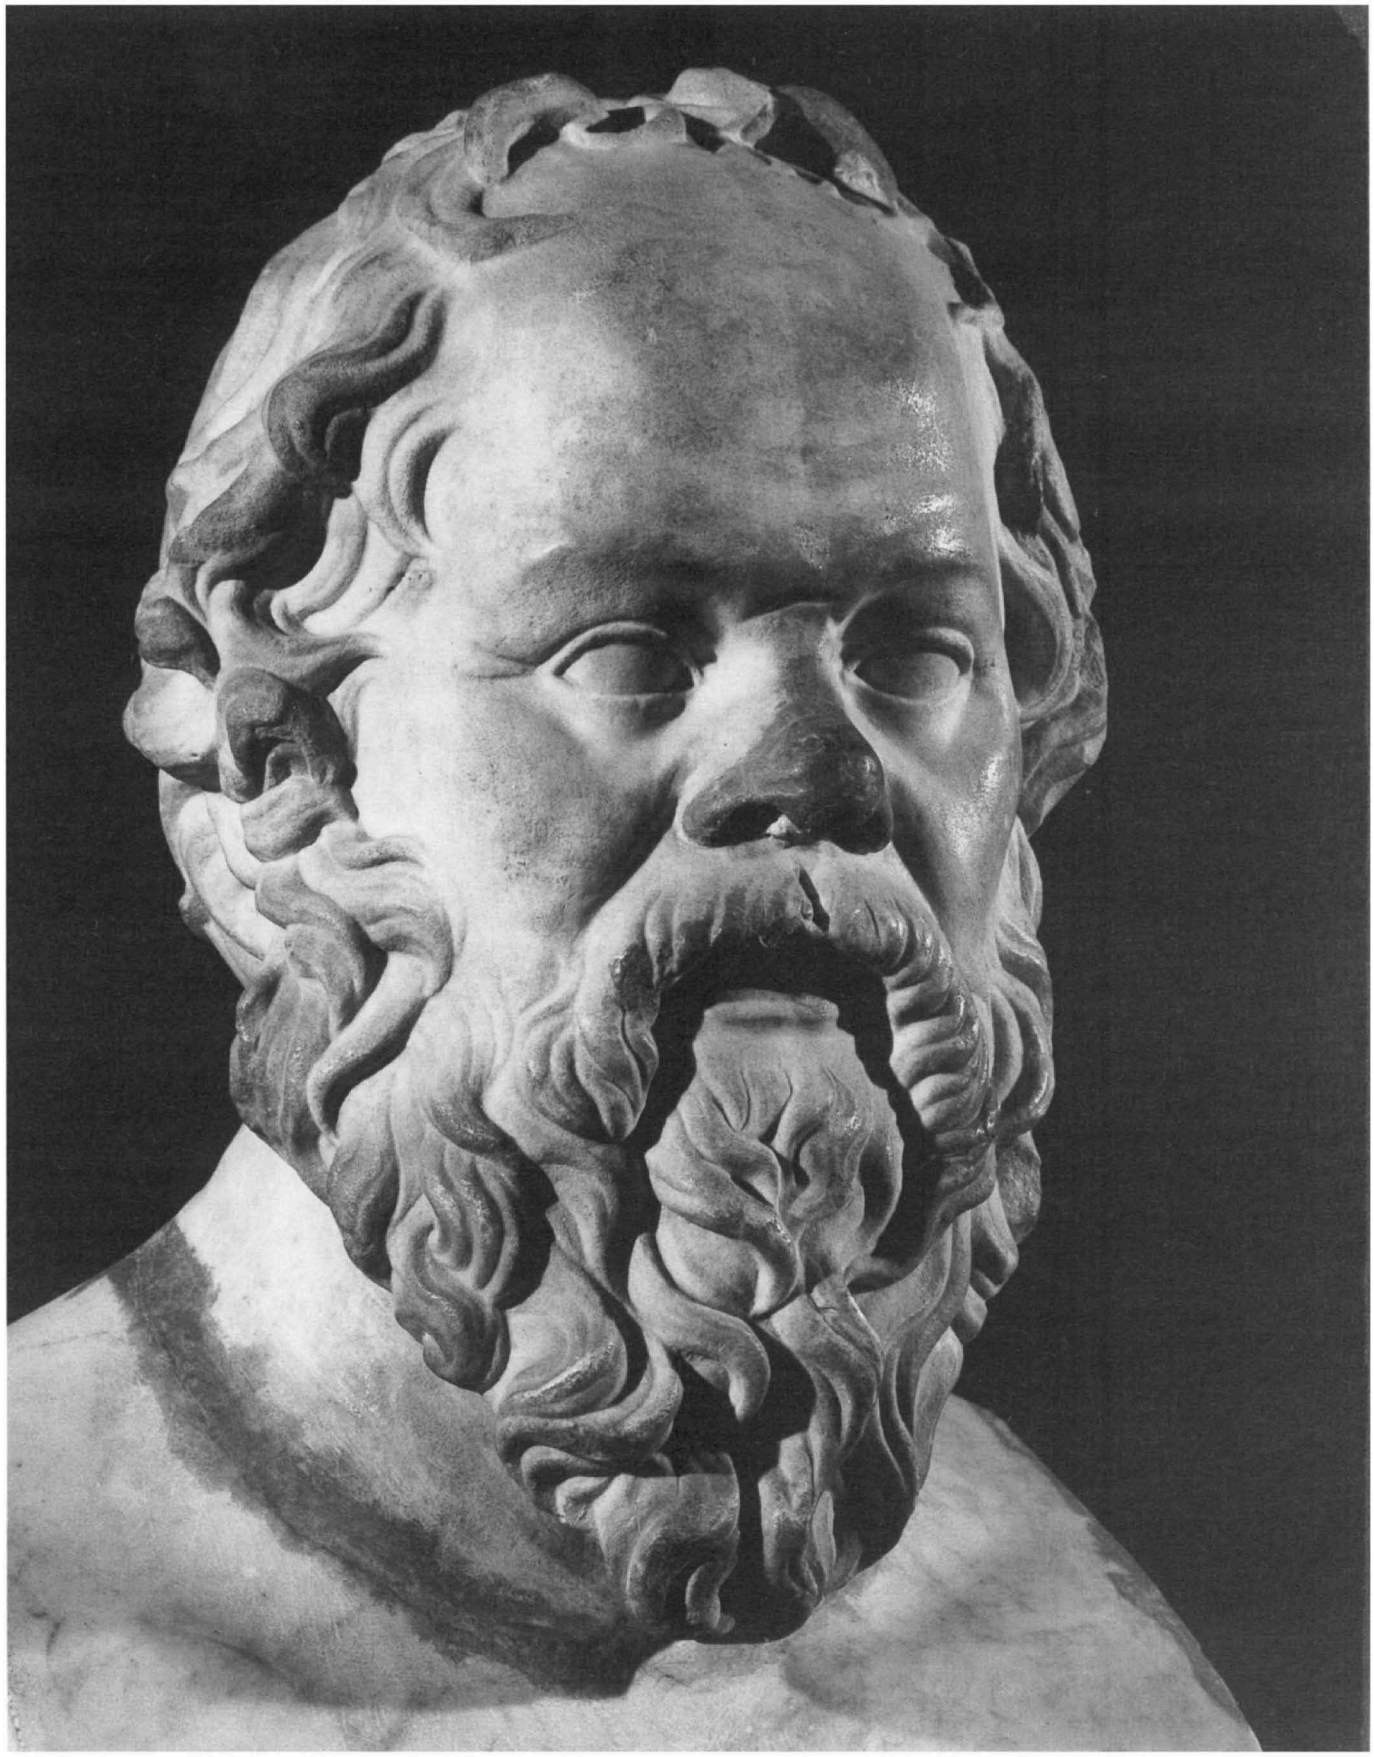
Socrates was born in Athens, the son of a stonemason and a midwife; he was executed by the Athenian democracy in 399 BC. He did not leave any written work; and yet Karl Marx rightly called him the embodiment of philosophy (*Rheinische Zeitung*, no. 179, 1842; Karl Marx–Friedrich Engels, *Werke*, vol. 1, Berlin, 1956, p. 91). For Socrates lived his entire life for philosophy. He learned his father's craft, but the political service of his polis and the education of his fellow-citizens were more important for him. Such a way of life was possible, for everyday life was simple and thus not expensive. He strove to be a good citizen and served his native city several times as a brave and persevering soldier, but he refused to act wrongly when ordered to do so by the authorities of the pseudo-democracy. He considered that his first duty was to seek the truth and he tried to show it by the maieutic method of his mother, the midwife. He made enemies by questioning the knowledge and opinions of his fellow-citizens in chance meetings. But he himself confessed that he knew nothing. Wishing to be taught, he became an ideal teacher; rejecting the sexual pederasty that was common in Classical Greece, he developed the pedagogical ethos. He was familiar with the doctrines and writings of the natural philosophers, especially of Anaxagoras, but their answers did not satisfy him. More important for him was the individual and social morality that was directed by the demonic, which was more powerful than the human conscience: it was a divine voice. Socrates was a deeply religious man. He made use of the sophistic dialectics, not for his personal advantage, but in the search for truth. He was not interested in establishing a philosophical system or in laboriously propagating them by writing. Already in his lifetime there were thus very different views about his personality and his doctrines. He was known as an odd man, and became an object of mockery and caricature (for instance in the comedies of Aristophanes), and, as we have seen, he made enemies for various reasons. He was thus subjected to a political trial, charged with impiety and corrupting young men, and was condemned to death by the Athenian radical democracy.

According to the customs of his time Socrates' wife and sons were in the background of his life. This was the cause of many anecdotes about the character of his wife Xanthippe and his relations with her. Indeed, his relationships with his friends and pupils were particularly important for him. Socrates, the man without riches or power, attracted a circle of aristocratic young men which occasionally attracted criticism from some democrats. Members of this circle included the two authors whose writings about Socrates survive: Xenophon and Plato. Xenophon was a competent officer, a successful farmer, and a good chronicler, but he was more a man of action than of theory. What he reports in his *Memorabilia* is very valuable, but it represents only part of Socrates' philosophical speculations. For Plato the figure of Socrates was a pretext to formulate his own opinions, and it is difficult to fix the boundary between Socratic inheritance and Plato's continuation. It should be noted that neither Xenophon nor Plato mention each other.

Socrates did not participate in Athenian politics, but some of his pupils were celebrated as the founders of various philosophical schools, such as Plato of the Academy, Aristippus of the school of Cyrene, Phaedo of the school of Elis, and Antisthenes of the school of the Cynics. The Hellenistic doxographers did not reflect the doctrines of Socrates, but preserved a tradition of anecdotes and apophthegms, of which we find traces in the writings of Diogenes Laertius of the 3rd century AD.

In the Roman period a new and different interest in Socrates awoke. A collection of fictitious letters of Socrates appeared (edited by L. Koehler, Berlin 1928). Plutarch, the popular philosopher, priest at Delphi, and archon at Chaeronea, wrote *On the Divine Socrates* and *On the Condemnation of Socrates* and produced an *Apology for* Socrates. A friend of Plutarch, Favorinus of Arelate (2nd century AD), rhetorician and polymath, wrote a (lost) book *On Socrates and His Erotic Art*, which drew the criticism of the contemporary physician and philosopher Galen of Pergamum. The archaizing orators Dio Chrysostom and Maximus of Tyre treated Socratic problems in their speeches, such as the demonic or the erotic, and influenced their colleagues. The Neoplatonists celebrated the birthdays of Socrates and Plato with sacrifices, solemn dinners, and speeches.

At Rome the life and work of Socrates were read more in Xenophon than in Plato. The most important mediator was Panaetius (*c.*185–109 BC), the director of the Middle Stoa. Cicero called Socrates the father of philosophy and praised him for bringing philosophy down from heaven to everyday life (*Academica Posteriora*, 1. 415). The philosopher Seneca the Younger (1st century AD), when speaking of Socrates, utters only commonplaces. Valerius Maximus (early 1st century AD) in his *Factorum et Dictorum Memorabilia* sometimes mentions



Socrates: antique marble copy of a bust from the 4th century BC attributed to Lysippus, Louvre, Paris

Socrates as a praiseworthy example of virtue and wisdom with sound character and self-control.

For the Christian Apologists, and especially for Justin (*c.*AD 100–*c.*165), Socrates was a forerunner of Christ; for Socrates the *logos* (intellect) was necessary, while Christ is in possession of the *Logos* (governing principle of the universe). The Alexandrian theologians held this view, but it was rejected by western Christian writers; for St Augustine all the virtues of the pagans were no more than splendid vices.

During the Middle Ages Socrates was nearly forgotten in the West. His name signified the wise man par excellence, but it remained a mere name. The anonymous poem *Causa Pauperis Scolaris cum Presbytero* was ascribed to him; the "doctor universalis" Alanus ab Insulis (*c.*1125/30–1203) in his *Distinctiones Dictionum Theologicalium* had Socrates conversing with Christ. Godefridus of Breteuil (12th century) calls Socrates the "fons philosophiae". In the *Divina commedia* of Dante Alighieri Socrates is to be found in Purgatory (4. 135) beside Plato and Aristotle.

The situation in the Byzantine east was little better. The chapter (2. 5) about Socrates in the *Lives* of Diogenes Laertius (3rd century) is full of anecdotal material, and the lexicon known as the *Suda*, from the 10th/11th centuries, made wide use of it. The *gnomologia* (collections of maxims) are in the same tradition, more interested in biographical dates than in the doctrines of Socrates. But the portrait of the Athenian wise man was also present. In the paintings of the tree of Jesse in the late medieval churches of Greece and Bulgaria Socrates is often portrayed among other pagan philosophers. In the last period of the Byzantine empire Xenophon's *Memorabilia* were again read, and in the controversy over hesychasm the writings of Plato played an important role. Some of the Renaissance humanists revered Socrates extravagantly. Marsilio Ficino, the translator of Plato, was ready to equate Socrates with Christ, and Desiderius Erasmus, the leader of the northern humanists, formulated the prayer: "Sancte Socrates, ora pro nobis!"

But the real Socratic century was the 18th. All branches of philosophy made use of the figure of Socrates, at first leaning on Xenophon, and after the publication of the *Phaedo* by Mendelssohn, more on Plato. Socrates became the type of the popular philosopher. In the 19th century the Danish thinker Sören Kierkegaard admired and interpreted Socrates as a "subjective" (not idealistic) philosopher, whose mode of life he imitated in his own. Friedrich Nietzsche, the philological specialist on Diogenes Laertius, considered Socrates as the philosopher of *décadence*. In the 20th century the Greek publicist Kostas Varnalis in his *True Apology of Socrates* criticized the falsification of Classical ideals by bourgeois society, and in a similar manner Bertolt Brecht wrote about the "wounded Socrates" (*Geschichten*, Frankfurt, 1962, pp 109ff.).

Biography

Born at Athens in 470 BC the son of a stonemason and a midwife, Socrates served as a soldier in several battles. He was married to Xanthippe and had two sons. He played little part in public life and devoted himself entirely to philosophical debate. He wrote nothing, but his pupils included the founders of several philosophical schools, including Plato. When ordered to arrest an innocent man he refused to comply. He was charged with impiety and with corrupting young men and condemned to death in 399.

Solomos, Dionysios 1798–1857

Poet

Born on the island of Zakynthos to Count Solomos, a tobacco merchant, and his young maid Angeliki, Dionysios Solomos was raised in the privileged manner of the Zakynthian nobility. In 1808, a year after his father died, Dionysios was put in the charge of his tutor, the liberal-minded priest Don Santo Rossi, who is thought to have exercised considerable influence on the young boy's artistic and political ideas. After a ten-year sojourn in Italy, where he acquired a solid classical education and became acquainted with Italian Neoclassicism and the emergent Romanticism of his day, Solomos returned to his native island in 1818 to begin a career as a poet. His early poems, written in Italian, are mostly of a devotional nature and show him a competent and skilful versifier, though lacking in originality. Within a couple of years of his return to Zakynthos, Solomos began to write in Greek, a language he is said to have "imbibed with his mother's milk". In a bid to

encourage the young poet's use of his native language, Spiridon Trikoupis told him upon meeting him that "Greece is waiting for its Dante". Solomos turned for inspiration to the rich vein of Greek demotic songs, dirges, and pastoral idylls which had formed an anonymous oral tradition since Byzantine times. He wrote lyrics, elegies, odes, and satires, as well as a prose work in defence of vernacular poetry modelled on the Platonic dialogue and probably inspired by Dante's *De Vulgari Eloquentia*.

Solomos's poetry is nearly always fast-moving and melodious. He made use of various metrical forms, Greek and Italian. The most important of these was the 15-syllable line, a distant descendant of the Classical dactylic hexameter, used by Cretan bards throughout the 16th and 17th centuries. Solomos's early poems display a Romantic's preoccupation with death, especially the death of young innocents. Later, as his poetic vision matured, he combined bold lyricism with an ethical outlook rooted in the idea of spiritual freedom. Among Solomos's most important works are *Lambros*, an almost Gothic narrative of betrayal, incest, and suicide; *The Cretan*, a haunting lyric tale set at sea; and his monumental *The Free Besieged*, in which the long, tragic siege of Missolonghi by the Turks shows man defying the sufferings without and the temptations within until he has finally achieved a dignity commensurate with his highest ideals.

The *Hymn to Liberty*, his best-known work, written in 1823 during a month-long outpouring of political and lyrical enthusiasm, is a stirring account of the Greek War of Independence and the ideals it embodied for patriots and philhellenes alike. The poem is made up of 158 four-line stanzas, the first two of which were later adopted as the fledgeling country's national anthem. Thus at the age of 25 Solomos became the country's national poet. His own youth seemed to be consonant with the youth of the nation. The hymn's role in Greek emancipation is rightly deemed inestimable. It was quickly translated into all the major European languages and widely disseminated among foreign politicians and men of letters. The sympathy which it aroused on behalf of Greek independence has prompted one biographer to characterize its political contribution as equivalent to numberless frigates and regiments. Solomos, however, did not see himself as a man of action but as a poet whose first duty was to his art. A restless perfectionist, he set himself the impossible task of single-handedly adapting demotic Greek as a vehicle for the highest philosophical and artistic ideas.

One consequence of this incessant perfectionism was Solomos's inability to complete any of his longer poems. Solomos's continual artistic development invariably tended to outstrip the pace of his work, leaving many of his projects unfinished. Most of his mature work comes to us in what have been wrongly labelled "fragments"; however, nearly all of Solomos's extant poems are complete in themselves, even if the larger work for which they were intended never came to fruition. In this respect Solomos resembled other Romantic poets such as Byron, Shelley, or Keats. It should be remembered that modern Greek was still in its infancy as a literary language, a point well observed by the poet George Seferis, who repeatedly acknowledged his own debt to the Zakynthian bard. Solomos's success can be measured by the fact that vernacular Greek was never again seriously challenged by katharevousa as the natural language of poetry. No one ever again doubted that the everyday speech of the people could articulate the loftiest ideas. But for Solomos this was never an axiom. The many discarded drafts in his extant manuscripts show him wrestling with the problem of finding the right form and register for his ideas.

Solomos believed earnestly that the poet has to be a profound thinker as well as a skilful versifier. He found the technical perfection of Italian Neoclassicism wanting and turned to German aesthetic philosophy for direction. In his later poetry he was greatly influenced by Schiller's ideal of *das Erhabene*, the sublime. The aim of poetry, in Solomos's view, was to elevate men's souls, an artistic virtue he greatly admired in ancient poetry, especially the Homeric epics. Unlike his Neoclassical forerunners, however, Solomos did not dress up his poetry with Classical lore in a bid to make it seem dignified or grand; instead he made sparing use of the motifs of ancient epic, lyric, and tragic verse. He believed that the poets of ancient Greece had struck a perfect balance between form and content. Nevertheless, Solomos refused to subordinate his poetry to the forms of Classical models but sought rather to emulate the spirit in which they had been composed. His translation of book 18 of the *Iliad* was the first truly poetic rendition of the work into modern Greek and it spurred many of his disciples to do the same for other classics.

In his last years Solomos began to write poetry in Italian once more, but by then his contribution to Greek letters had been decisive. Nearly all subsequent Greek poetry owes something to Solomos. Kostis Palamas, who succeeded Solomos as Greece's national poet, paid tribute to the Zakynthian in his own poems and in many articles about Solomos's poetry. The free lyricism of Solomos's later works anticipated the lyrical experimentation of Seferis and Elytis, while the almost prosodic commitment to ideas can be seen in the work of Cavafy. Ironically, Solomos's most lasting contribution may lie in his revisions, aborted poems, and notes to himself. In these one sees the first great modern Greek poet struggling to harness the fleet rhythms of the vernacular to lofty themes which had been the exclusive preserve of classicizing Greek since late antiquity. "With Solomos," Zisimos Lorentzatos has written, "the problem of artistic expression enters our cultural life, as the problem of independence entered our national life."

Biography

Born on Zakynthos in 1798, Solomos was educated in Italy from 1808 to 1818. Returning to Zakynthos in 1818 he wrote his first poems in Italian. Then turning to demotic Greek he wrote lyrics, elegies, odes, and satires. His most famous work is the *Hymn to Liberty* (1823), the first two stanzas of which later became Greece's national anthem. He died in 1857.

Solon *c.*640–*c.*560 BC

Poet, statesman, and philosopher

Solon lived and worked in Athens in the late 7th/early 6th century BC. His poetry survives only in fragments. The biographical tradition is late and not completely reliable, but one may draw a general picture of Solon's life and activity. He was an aristocrat, and became active in Athenian politics probably at an early age.

Solon's entry on to the political stage appears to have occurred in the following way. Athens and its neighbour to the west, Megara, had been fighting for some time over the possession of the island of Salamis, which lies between the two cities in the Saronic gulf. When Solon was a young man, the island was in the possession of Megara and the Athenians had passed a law forbidding discussion of reopening the war for possession. If the sources can be believed, Solon rushed into the marketplace feigning madness and recited a long poem about the recovery of the island (frr. 1–3). The war was resumed and ultimately Athens regained possession. The story reveals something about the way people perceived Solon's character: fiercely Athenian, he was full of bravado, and very clever. He was a good enough poet and speaker to persuade his audience, and he made his appeal directly to the people rather than going through official channels. All these traits seem characteristic of Solon, even though the story is probably apocryphal.

Having acquired a reputation for wisdom, Solon was given the task of reconciling two opposing forces in Athenian politics: the tyrannical rulers, and the people who were on the verge of revolt. To accomplish this task, Solon composed a set of laws which effectively ushered in democratic ideals (frr. 4a–c). Among his reforms were the *seisachtheia*, or shaking off of debts, the introduction of a representative council of 400 Athenian citizens, the abolition of debt slavery, a grant of amnesty for all those who had left Athens on account of excessive debt, and other measures (see *Athenaion Politeia*, 5–12). These laws were apparently meant to replace the stern measures contained in the code of Draco, the earlier and harsher legislator of Athens. After putting the reforms into place, Solon was said to have left Athens for ten years.

Although Solon clearly opened a door to representative government for the people, the reforms were not entirely effective and ultimately Athens slipped back into a modified tyranny which it would not escape until the late 6th century BC. In spite of this, Solon's name became linked with democracy and remains so to this day. The Attic orators of the 4th century BC (Demosthenes and others) commonly invoked Solon as the founder of democracy, and the mid-4th-century BC text referred to as the *Constitution of the Athenians* (*Athenaion Politeia*) attributes virtually all democratic reform to either Solon or Cleisthenes. Solon was a reform-minded conservative who tried to address the concerns of the people while at the same time maintaining a firm power base for the aristocracy.

So little of Solon's poetry has survived (about 300 lines out of a total output of well over 5000) that it is difficult to draw many firm conclusions about it. His poetry treats various themes, including politics (fr. 4), the dangers of excessive wealth (fr. 13), the notion that there are seven ages to a man's life (fr. 27), and even food (frr. 38–40). He is the first Athenian poet, indeed the first firmly established figure in Athenian history, although he did not write in the Athenian dialect. This poet of Archaic Athens wrote on a variety of topics central to the life of the individual and the polis. In doing so, he foreshadowed the flowering of the Classical period.

Many of the themes which Solon addressed became standard in later literature, particularly in Athenian tragedy. Specifically, fr. 13 contains, among other themes, the notions that one must guard against excess and that one must take care not to offend the gods by obtaining wealth unjustly lest they exact vengeance. This paradigm, excessive wealth (*koros*), leading to an act of overweening pride (*hybris*), which brings on justice (*dike*) and ultimately divine retribution (*ate*), is at the core of much Greek tragedy of the 5th century BC. Solon clearly saw Zeus as the driving force of the paradigm. He is not only the principal deity, but a guide to correct action. One can easily imagine that the early 5th-century BC tragedian Aeschylus had read Solon's poetry. In another poem (fr. 5) Solon spoke of the need to find the middle way, much as Aeschylus did in the final play of the Oresteia, *Eumenides*.

The wisdom for which Solon's poetry and political acumen made him famous is epitomized in his meeting with the Lydian king Croesus (Herodotus, 1. 29–33). After showing Solon his vast wealth, Croesus asked Solon who he believed was the happiest man. Solon replied that Tellus the Athenian was happiest because he had a good family and had died defending his country. Croesus asked who would be second, and Solon chose Cleobis and Biton. These two Argive heroes had yoked themselves to an oxcart and pulled their mother, a priestess, to a festival of Hera. On entering the temple of Hera, the mother prayed that her sons should receive the greatest gift the gods could give. She emerged to find the two lying on the temple steps, dead. Solon then told Croesus to count no man happy until he has passed the limit of his life, i.e. one cannot judge that a man's life has been happy until he has lived all of it. The story and its attendant proverb, often misinterpreted as though the Greeks thought death a good thing, demonstrate the insight for which Solon was famous.

Although Solon's poetry has received some scholarly attention, discussion of it generally focuses not on its technical innovation but on the thoughts that it contains. Through the ages Solon has been cited principally as a statesman, a wise legisla-

tor, and one of the seven sages. His most important legacy has been the ideals of democracy.

Song

The corpus of Hellenic song includes a broad range of repertories for amateurs and professionals that reflect the ubiquity of singing in Greek society from antiquity to the present day. This diversity reflects not only processes of stylistic development, but also the varied ways in which vocal music has served to punctuate nearly every aspect of public and private life. The study of repertories antedating the 19th century, however, is limited by the historical tendency of Greek singers to rely heavily on oral methods of transmission. Despite the existence of ancient Greek musical notation, for example, we possess only an unrepresentative handful of melodies from antiquity. One consequence of these losses is that songs originally viewed as a union of verse, melody, and, in the case of choral lyric, dance are today primarily viewed from a literary perspective. Yet even if the pitches for ancient songs are lost, their rhythm may be partially recovered from the study of their quantitative metres, elements of which have been shown to survive in modern Greek folk music.

The written history of Greek song begins with the *Iliad* and the *Odyssey*, two relics of oral traditions of sung epic which mention the performance of such forms of vocal music as paeans, laments, and wedding songs. While certain repertories continued to be transmitted entirely through oral means, the texts of others gradually became subject to literary transmission. The inclusion of singing competitions in the festivals sponsored by Greek cities – e.g. the funeral games held in Chalcis around 700, at which Hesiod won a prize for song – was evidently a major stimulant to the development of cultivated forms of song, as was cultural interchange between the Aegean and the mainland. An important link between the latter was Terpander (700–650 BC), who left his native Lesbos to embark on a career as a prize-winning poet and *kithara* (lyre) player that has earned him general recognition as the father of lyric poetry. Such cultural interchange, however, did not prevent the emergence of distinct regional schools of composition during the 7th century BC. Lesbos gave birth to the Aeolian lyric of Sappho and Alcaeus, both of whom wrote solo songs of modest scale intended for private or semi-private performance. On the mainland the remarkable mix of religious and state ceremonial with competition and mass entertainment featured at such festivals as the Carneia in Sparta and the Pythian games in Delphi promoted the growth of increasingly complex forms of solo and choral lyric, most of which were accompanied on either the *kithara* or the *aulos*. Particularly significant was the emergence in Corinth around the year 600 BC of the dithyramb, a choral dance to Dionysus with *aulos* accompaniment that later played a seminal role in the development of tragedy.

Over the course of the 6th century BC poet-musicians received increasing levels of state support, particularly from dictators seeking to heighten the prestige of their city states. Athens, for example, witnessed the enlargement of the Panathenaia and Dionysia festivals, followed later by the Pisistratids' sponsorship of such composers as Lasus, Simonides, and Alcaeus. The succeeding generations of 5th-century BC Athenians, which included Pindar and the great tragedians, brought song to its apogee as an integrated art form encompassing verse, music, and dance. Soon, however, the old categories regulating the form and content of compositions began to break down under the strain of constant innovation and ever-increasing technical virtuosity. Consequently, music and poetry drifted apart not only from the civic and religious contexts that had raised them to prominence, but also from each other, relegating the poets and musicians of later antiquity to separate professional fields.

Harsh criticism of the allegedly decadent state of song began during the 5th century BC with Plato and continued throughout the Hellenistic and Roman periods. This critique was eventually adopted by the Fathers of the Christian Church, who broadened it to include funeral laments and licentious wedding songs. In place of the music of pagan society, St Basil, St John Chrysostom, and other Church Fathers offered psalms, the singing of which was initially popularized by Egyptian desert monks. The rapid development in cathedrals and urban monastic communities of melodically interesting psalmody and hymnography laid the foundations for Byzantine chant and other regional traditions of Christian liturgical song.

With the exception of a few acclamations, notated sources for medieval Greek secular music are completely absent, leaving unknown the extent to which ancient song survived among either the common people or the Classically educated elite of Byzantium. Manuscripts and theoretical treatises of Byzantine chant, however, bear witness to the introduction of new organizational principles for the composition of vocal music. Reflecting the effects of both organic growth and external influence, these innovations included accentual metre – the general adoption of which was stimulated by changes in the pronunciation of the Greek language – and the system of eight modes (*octoechos*) attributed to St John of Damascus. The broader significance of these developments is shown by the presence of cognate modal and metrical structures in Greek folk songs. Indeed, despite the linguistic gulf between the patristic Greek of liturgical chant and the vernacular, Greek sacred and secular song have maintained strong musical and textual affinities to the present day.

The oldest surviving vernacular song texts are the *akritika*, a repertory describing the exploits of the Byzantine empire's border guards during the 9th to the 11th centuries, which are transmitted in 14th-century manuscripts. Four Athonite codices of liturgical music ranging in date from 1562 to the beginning of the 18th century contain the first songs preserved with their melodies, which are notated in Byzantine neumes. Probably transcribed by Cretan monks, these works include both folk and art songs. The fact that one of the latter – the single Greek song of MS Iviron 1189, held on Mount Athos – was recorded alongside two Persian compositions is indicative of the extensive participation of Greeks in the musical cultures of their rulers and neighbours during the centuries of their domination by Ottomans and Italians. One result of this involvement, which extended into the early decades of the 20th century, was the creation of such hybrid repertories of cultivated Greek song as the *kantades* (serenades for male chorus) of the Ionian islands and the *amanedes* (songs with an "aman" refrain) of Constantinople and Smyrna.

Since the 19th century the systematic study of the received tradition of Hellenic folk song as practised from Corsica to Asia Minor has been taken up by scholars employing diverse methodologies. Philologists, musicologists, and ethnographers have discerned in the metres, subjects, and melodies of Greek folk songs a degree of continuity with antiquity and Byzantium, as well as innovation and close relationships with other cultures. Some have grouped the repertories by textual content and social function into such broad categories as life-cycle songs (lullabies, wedding songs, laments, etc.), narrative ballads (*paraloges*), historical songs (e.g. *klephtika* praising the bands of outlaws who resisted Turkish authority), songs for the seasons and Christian feasts of the year (*kalanda*), and dances. Meanwhile, Chianis and others studying the regional traditions of song from a more strictly formal perspective have observed certain shared characteristics differentiating, for example, the repertories of the islands and Asia Minor from those of the Greek mainland. In particular, Baud-Bovy has noted that these families differ according to (*a*) poetic metre and strophic form; (*b*) the presence or absence of rhyme, the former being more typical of island songs; (*c*) their preference for improvised poetry (as in the *mantinades* – improvised couplets – of Crete) or melodic ornamentation; (*d*) their dance rhythms; and (*e*) the composition of their instrumental ensembles. Also of signal importance are the melodic and scalar (diatonic, pentatonic, and chromatic) patterns employed in each area and their degree of kinship to the modes (*echoi*) of Byzantine chant or the *maqams* of Ottoman and Arabo-Persian music.

Although the foundation of the modern state of Greece and the subsequent administrative reforms of the Ottoman empire provided many of the necessary preconditions for the recording and preservation of Greek folk songs, they also fostered the growth of the popular repertories that have progressively replaced them. Disseminated at first through public performances and printed musical scores in western and Byzantine notation, these urban songs became ubiquitous in the 20th century through gramophone records and electronic broadcasting. The prosperous Phanariots of Constantinople and the residents of the Ionian islands preceded the cities of the new Greek kingdom in their development of distinct popular repertories. Eventually the influence of Ionian *kantades* and performances of Italian music by visiting opera troupes contributed to the emergence of a highly westernized form of Athenian song in the last decades of the 19th century. Among the Greek bourgeoisie, popular songs composed in western styles remained in the ascendant until the onset of World War II. Much of this music was intended for the stage, including revues (*epitheoreseis*) dominated by Greek adaptations of foreign arias and popular songs. The arias of Greek operas enjoyed a period of popularity during the early years of the 20th century, before they were overshadowed by the songs featured in the phenomenally successful operettas of such composers as Nikos Hatziapostolou (1879–1941) and Theophrastos I. Sakellarides (1833–1950). Meanwhile, non-dramatic songs employing varying mixes of native and western musical elements continued to be composed, notable among which were the songs of Attik (pseudonym of Kleon Triantaphyllou, 1895–1944), Michalis Souyioul (1906–58), and Kostas Yiannides (pseudonym of Yannis Konstantinides, 1903–84).

The rise of westernized popular song in late 19th-century Athens was complemented by the emergence of orientalizing Greek repertories in the cities of the Ottoman empire. Exported to the west through the harmonizations of Bourgault-Ducoudray and Ravel, these songs were performed for middle-class Greeks along with Turkish and western popular music in cafés that often featured female vocalists and dancers, many of whom were Jews or Gypsies. After musicians from Smyrna founded the first so-called *Café aman* in Athens in 1873, similar establishments began to appear in Greek

communities around the world, provoking denunciations from those who rejected the oriental style on aesthetic and patriotic grounds. The forced migration of Asia Minor's Greek population to the Hellenic kingdom in 1922 brought the essentially bourgeois music of the *Café aman* into close contact with a repertory viewed with even greater distaste by westernized Greeks, namely the *rebetika* of the urban underclass. Frequently compared to the American blues, these songs of hardship and alienation were originally created in prisons and the hashish dens (*tekedes*) of Piraeus. Typically accompanied on such fretted stringed instruments as the bouzouki and the baglamas, *rebetika* featured an evolving mix of modes (*dromoi*) related to Turkish *maqams*, western tertian harmony, and dance rhythms (e.g. the *zeimbekiko* in 9/4 and the *tsifteteli* in 4/4) shared with the songs of the *Café aman*. A more general convergence with the oriental style of the refugees during the 1930s gradually brought *rebetika* greater social respectability while also subjecting their future development to commercial pressures. Vassilis Tsitsanis (1915–84) then led a new generation of musicians who oversaw the transformation of *rebetika* during the 1950s and early 1960s into *laika* (popular song), a hybrid style characterized by technical virtuosity, generally lighter texts, and eclectic borrowing from foreign popular musics, including those of Latin America and India.

Western-oriented Athenian popular song also underwent major changes after World War II. Although ephemeral adaptations of the latest American hits were never lacking, during the 1950s there emerged the distinctly Greek phenomenon of "popular art-song" as a group of composers, many of them classically trained, began to set texts of often outstanding literary merit in a finely crafted popular musical idiom. Pioneered by Manos Hadjidakis in songs and works for the stage transcending the boundaries that existed in Greece between "high" and "low" culture, the style was firmly established by Mikis Theodorakis with a setting of selections from the *Epitaphios* of the poet Yiannis Ritsos in 1958. Over the next two decades Theodorakis, who was grounded ideologically in socialist realism and musically in Byzantine and folk music, and Hadjidakis, who eschewed political involvement, were joined in their efforts to expand the artistic horizons of Greek popular song by, among others, Stavros Xarhakos, Yannis Markopoulos, Christodoulos Halaris, and Thanos Mikroutsikos. In addition to individual songs, these composers produced ambitious song cycles and cantatas setting poetry by Kornaros, Elytis, Kampanellis, Gatsos, Neruda, and Seferis for ensembles often incorporating the bouzouki and other Greek instruments. A refreshing alternative to the increasing historical and political self-consciousness of "popular art-song" was provided by Dionysios Savvopoulos in his relatively unpretentious songs of social critique.

The lifting of censorship in Greece that followed the collapse of the colonels' dictatorship in 1974 temporarily strengthened the links between singing and left-wing politics as the songs of communist guerrillas from the 1940s, the works of Theodorakis, and other suppressed repertories were revived. Nevertheless, within a few years it became apparent that neither leftist ideology nor the return to folk music advocated by Markopoulos could succeed in rejuvenating "popular art song". As Theodorakis, Hadjidakis, and Mikroutsikos turned to focus on the composition of art music, the leadership of Greek popular music passed to Giorgos Dalaras and other celebrity performers. Radical stylistic diversification ensued over the last two decades of the 20th century as foreign influence competed with renewed interest in traditional forms, giving rise to a fragmented culture of song in which orientalism and Europop coexisted with authenticist revivals of folk music and *rebetika*.

Sophists

"Sophist" is a general name given to a variety of (mainly rhetorical) intellectuals and virtuosos who appeared in Athens in the mid- to late 5th century BC. It was a term of opprobrium that, while recognizing that these men were all competent at what they did, carried with it many of the connotations of the American phrase "wise guy" when used by such contemporaries as Aristophanes and Plato. Most Sophists that are known about were not Athenians, but flocked there because there was a market for what they had to teach, public speaking skills that would be effective in political life and in litigation. As there is very little extant that might enlighten modern scholars, there have been many efforts to reconstruct their teachings, particularly since G.W.F. Hegel's *Lectures*. Fragments of and *testimonia* relating to the Sophists were included in Hermann Diels's *Die Fragmente der Vorsokratiker* (1896, with many subsequent editions), which remains the standard reference in spite of long-recognized problems with the texts he published.

Among the most famous are Protagoras of Abdera (*c.*490–420 BC?), Gorgias of Leontini (483–*c.*400 BC), Prodicus of Cos (*c.*470–399 BC), and Hippias of Elis (b. 433 BC?). Protagoras and Gorgias were both active in official capacities, the former as the author of the laws governing the Athenian colony at Thurii (in 443 BC) and the latter as ambassador to Athens in 427 BC. Gorgias is perhaps the best known, since some works attributed to him have survived in their entirety, e.g. the famous *Encomium to Helen*. Only a few lines of alleged quotations of Protagoras are extant. Prodicus and Hippias were polymaths, with interests extending from natural science and mathematics to rhetoric and semantics. Others often named as "Sophists" include Thrasymachus, Antiphon of Rhamnos, and the Athenian aristocrat Critias, a prominent leader of the antidemocratic faction active in Athens in the last decade of the 5th century.

In later antiquity, particularly in the setting of the New Academy, the Sophists were admired, along with Isocrates, for their eloquence and their efforts to systematize the teaching of rhetoric. Since then, the Sophists have been consistently placed on the margins of the philosophical establishment. Their apparent challenges to traditional values and their divergences from intellectual orthodoxy attracted the notice of later philosophers similarly situated; and so their champions tend to be the dissenters: Denis Diderot and Friedrich Nietzsche, for instance. In recent years there has been a resurgence of interest in their ideas, one doomed, perhaps, by the sparse record left to us and by the variety of ideas the Sophists expounded.

Summary

A term of abuse, the word "sophist" was applied to an intellectual circle that appeared in Athens in the 5th century BC. Most were not native Athenians. They set themselves up as teachers of rhetoric. In later antiquity they were admired for their eloquence. The term was revived by the movement known as the Second Sophistic.

Sophocles *c.*496–406 BC

Tragedian

Sophocles was born at Colonus near Athens in about 496 BC and died in 406 BC. Living through the glorious Persian Wars, and the increasingly inglorious Peloponnesian War, he was spared the sight of Athens' final defeat at the hands of Sparta, when it had to dismantle its walls in 404 BC.

He was a model citizen. He acted as a treasurer in the league Athens organized against Persia. He studied dance and was said to have danced round the trophy after the battle of Salamis. He also served as a general dealing with the Samian revolt in 441. After the Sicilian defeat he was one of the *probouloi* (Committee of Ten) elected to deal with the disaster.

Like Aeschylus, Sophocles acted in his own plays. In extreme old age he is said to have been sued by a son, who claimed he was no longer capable of managing his own affairs. He read lines from the recently written *Oedipus at Colonus*, and was acquitted. After his death Sophocles became a sacred hero like Oedipus, and was worshipped as *Dexion*, roughly translatable as "he who receives", because of his association with the cult of Asclepius, which he had helped to introduce into Athens after the plague (430–426 BC).

In Aeschylus, god can confront god and major questions are raised about conflicting rights. Sophocles shows man confronting god and a world he claims can never be knowable. As one fragment says (871 Radt), the fate given to us by god is as changeable as the moon; "it never can maintain one shape for two nights, ... just when it is at its fullest and most beautiful, it flows away and ebbs to nothing." All that can be known is something transient, like the moon in one of its phases. In spite of this, man struggles nobly. Truth, loyalty, and commitment to one's chosen path, all characterize the Sophoclean hero

Sophocles: scene from a modern production of *Antigone*, with Amy Greenfield in the title role

and condemn him or her to isolation. But often in his isolation he redeems society. For the Sophoclean hero, the love of the impossible proves to be a redemptive love.

Sophocles is said never to have taken third place when he competed. He wrote about 123 plays, more than the other two playwrights, and is said to have won 24 times (18 at the City Dionysia). Aristotle tells us he added one actor to the two that existed; this created additional possibilities for interchange and conflict. Aristotle tells us he increased the chorus from 12 to 15. He also used scene painting to enhance the visual background. He abandoned the practice of the connected trilogy, allowing him to highlight a major character, in contrast to Aeschylus' practice which allowed the development of a concept such as the workings of divine justice over several generations.

Of the plays that survive, only the *Philoctetes* and the *Oedipus at Colonus* can be dated with certainty, and the *Antigone* approximately, with reference to the Samian war. The following chronology is tentatively suggested: *Antigone* 443 or 441 BC; *Ajax* *c.*442 BC; *Trachiniae* *c.*432 BC; *Oedipus Tyrannus* *c.*427 BC; *Electra* *c.*413 BC; *Philoctetes* 409 BC; *Oedipus at Colonus* 401 BC (posthumous). There are many fragments, including a large part of the satyr play, the *Ichneutae*.

Antigone, *Oedipus Tyrannus*, and *Oedipus at Colonus* are often called "the Theban Cycle", but do not make up a trilogy, performed on one day. Instead they span Sophocles' life, and seem to reflect his own developing values. The *Antigone* shows a type of idealism which implies a belief in higher values to the point of sacrificing one's life to achieve them; Antigone opposes civic authority. G.W.F. Hegel said the *Antigone* was "one of the most sublime and in every respect the most consummate work of art human effort ever produced". The *Oedipus Tyrannus* seems to justify the struggle itself, as a type of self-affirmation, rather than the pursuit of an ideal. The last play shows sparks of the earlier struggle, but there is a final capitulation to death, prized as an end to suffering (*Oedipus at Colonus*, 1777–79).

Aristotle sees Sophocles as the greatest of the ancient playwrights and uses his *Oedipus Tyrannus* as a model of the way

a play should be written. Sophocles is a master of character, and of the language which creates character. He steers a path between the grandeur of Aeschylus and the witty colloquialisms of Euripides. He is also skilled at plots, and his *Oedipus Tyrannus* has been called the greatest detective story ever written. His lyrics are superb, and his characters often sing at dramatically important moments. He varies his rhythms and uses words percussively. Sophocles is also master of symbols and imagery, such as the use of blindness in *Oedipus Tyrannus*: when Oedipus can see he is blind, and when he is blind he can see. The bare island of Lemnos is also a wonderful symbol for the craggy hero Philoctetes. Sophocles has brilliant descriptions of nature, such as the ode to fair Colonus, a land of fine horses where the nightingale sings her melodious songs in the wine-dark ivy and sacred foliage (*Oedipus at Colonus*, 668–719).

The City Dionysia in 386 BC instituted a revival of the great plays of the 5th century. Around 330 BC the Athenian politician Lycurgus prescribed that copies of the texts of the plays should be deposited in the official archives, and that future performances should conform to these texts. The purpose was to safeguard the plays from adaptation and interpolation by actors and producers, of a kind to which they had already become vulnerable. These copies were lent to the Egyptian king Ptolemy I Euergetes, and will have passed into the library at Alexandria, to form the basis of the critical edition made by the librarian Aristophanes of Byzantium (*c.*257–180 BC). Aristophanes divided the lyrics (previously written as continuous prose) into metrical cola. He also added brief introductory comments, probably making use of Aristotle's lost *Didaskaliai* (production records). Part of these comments survive in the *hypothesis* (plot summaries) which were prefixed to the plays by later scholars in the Roman period. The composition of commentaries (*scholia*) on the plays was began in the Hellenistic period (by scholars such as Aristarchus of Samothrace, ?217–145 BC, and Didymus, ?80–10 BC). Further scholia were added in the Byzantine period.

The Theban plays were also popular in Rome: Accius (170–?86 BC) wrote a *Thebais* and *Antigona* (besides *Philocteta*) and Seneca (?AD 1–65) a particularly bloody *Oedipus Tyrannus*. The selection of the seven plays that survive was probably made in the 2nd or 3rd century AD and scholia were included for school use. After parchment replaced papyrus (around the 4th century AD), the unselected plays gradually passed out of use. After the Athenian Academy was closed in 529, the Classical texts disappeared from sight for several centuries and did not re-emerge until the revival of learning in the middle Byzantine period, when they were copied from the uncial into the new cursive script. Among the scholars who wrote commentaries and handled the texts of the plays the most important are Thomas Magister (late 13th century), Manuel Moschopulus (*fl.*1300), and Demetrios Triklinios (early 14th century). Triklinios brought a new metrical awareness to the amendment of the text, in particular the lyrics. Sophocles' *Oedipus Tyrannus* was one of the Byzantine triad along with *Electra* and *Ajax*. The oldest manuscript of Sophocles' plays is L (in the Laurentian library in Florence), written in the 10th century, and there are many others from the 12th to the 15th centuries. The first printed edition was published by Aldus Manutius in Venice in 1502.

There was a famous revival of *Oedipus Tyrannus* in 1585 in Palladio's Teatro Olimpico at Vicenza. The music for the odes was by Andrea Gabrieli. There were many European revivals and reworkings for the next 400 years. Notable ones were by Pierre Corneille, Voltaire, John Dryden, Heinrich von Kleist, Friedrich von Schiller, Hugo von Hofmannsthal, André Gide, Jean Cocteau, and others, to say nothing of how Sigmund Freud used both Oedipus and Electra to represent universal drives. *Antigone* is often used to express a country's political unrest.

Constant revivals are given in Greece. *Ajax* has been performed since 1868, with notable productions in 1961 (directed by Takis Mouzenidis, with music by Mikis Theodorakis) and 1983 (directed by Nikos Charalambous); *Trachiniae* in 1960, 1970 (directed by Alexis Solomos), and 1984 (Charalambous). *Antigone* has always been popular and performances date from 1863, with an outstanding one in 1965 (directed by G. Sevastikoglou, with Anna Synodiou as Antigone), 1990 (M. Volanikis, with music by Mikis Theodorakis), and 1994 (Theodoros Terzopoulos). *Oedipus Tyrannus* was performed in Greece from 1878, with excellent productions in 1951 (with Alexis Minotis directing and playing Oedipus), 1958 (also at the Théâtre des Nations with Alexis Minotis and Katina Paxinou as Jocasta), 1969 (directed by Karolos Koun), 1978 (directed by Robert Mitchell, costumes and masks by Dionisios Photopoulos), and 1984 (Koun, sets and costumes by Photopoulos).

Electra is considered a great vehicle for acting and has been done in Greece since 1899, with exceptional performances in 1959 (directed by Dimitris Rondiris, with Aspasia Papathanasiou as Electra), 1960 (with Katina Paxinou as Electra), 1963 at Delphi (Rondiris / Papathanasiou), 1978 (Rondiris, music by D. Metropoulos), 1980, and 1984 (Koun / Photopoulos). *Philoctetes* has been done since 1818, and notably in 1967 (with Alexis Minotis directing and playing Philoctetes), 1988 (two, one with Christos Tsakas directing and starring with sets by Yannis Tsatouchis, the other with Giorgos Lazanis directing and starring with sets and costumes by Photopoulos). *Oedipus at Colonus* has been done since 1907, with an excellent performance in 1975 (dir. Alexis Minotis, also starring) and 1986 (dir. Alexis Minotis, who starred, with sets by Yannis Tsarouchis and costumes by Dion Photopoulos).

There have been several films based on *Electra*, namely Ted Zarpas's in 1962, and *Electre* by Jean-Louis Ughetto in 1972, and a revolutionary *Elektreia* by Miklós Jancsó in 1975. There was also an *Oedipus Rex* by Tyrone Guthrie in 1957 with a screenplay adapted from W.B. Yeats, which emphasized the monumental in its use of masks, a version by Philip Saville in 1968 (*Oedipus the King*) which was more naturalistic in its approach, and an adaptation by Pier Paolo Pasolini (*Edipo Re*) in 1967. George Tzavellas made a politically charged film on *Antigone* starring Irene Papas in 1961, and Liliana Cavani's *I Cannibali* (1970) was also based on this play. Thodoros Angelopoulos's *The Travelling Players* wove its political theme around the Electra legend.

Biography

Born at Colonus near Athens *c.*496 BC, Sophocles played his part in public life. He was a treasurer of the Delian League, a *strategos* (general) at the time of the Samian revolt, and a *proboulos* (member of the Committee of Ten) after the failure of the Sicilian expedition. He wrote more than 120 plays and won at least 20 victories, the first in 468 BC. He died in 406 BC. After his death he was revered as a hero.

Souli

Region of northwest Greece

Souli is the name of a region comprising a group of inland Epirot villages, located between Ioannina and Parga (on the Adriatic coast). It has stood alongside such places as Mani in the Peloponnese and Sfakia in Crete as a territory symbolic of bravery, freedom, and, particularly, resistance against foreign rule. The name "Souli", while technically that of the principal village of the region, is used more generally for the territory encompassed by the group of villages.

Like Mani and Sfakia, Souli is situated in rugged terrain, which provides a natural barrier from outside invaders. In the Cassiopian mountain range, the villages of Souli perch on mountain crags and beside the gorge formed by the Glykys river. Surrounded by rocky peaks, ravines, and precipitous drops, Souli's remote location has historically allowed for a large degree of independence and autonomy for its inhabitants. Vast panoramas from many strategic locations make it possible to spot anyone approaching from afar, while the distinctive

ethnic background of the Souliots has provided a cultural isolation that parallels their geographic seclusion.

The origins of the Souliots are debated. Within the Souliot population, one tradition maintains that the Souliots are Orthodox Christians of Albanian ethnic descent who fled to their remote, rocky district to avoid Turkish domination following the death of Skanderbeg (Iskander Bey) in 1468. Others claim that the territory was founded in the early 17th century by shepherds looking for both unclaimed pasturage for their animals and relief from Ottoman rule.

By all accounts it seems clear that by the mid-17th century the territory was made up of four core villages, known as the *tetrahorion*: Kako Souli, Avarikos, Samoniva, and Kiafa. By 1700 seven more villages in the region had been founded; they comprised the *heptachorion*, and were situated further down the mountain and thus served as defensive outposts for the *tetrachorion*. In times of war the inhabitants of the lower villages sent their families up to the four villages above, and then defensively staked out the entrance to the narrow ravines that gave access to Souli. The 11 villages together comprised a "warrior confederacy", which came at the peak of its powers to control more than 60 villages on the plains below.

The villages of Souli thus managed to exist as a functionally independent island surrounded by a vast sea of Ottoman-held territory. Their primary, if not sole, territorial allegiance was to Souli itself, and they seem to have had little more loyalty or sympathy towards the Greek Orthodox peoples under Ottoman rule than they had to the Ottoman Turks themselves. Their inaccessibility allowed them to remain clear of the administrative, fiscal, and cultural reach of Ottoman rule. Their legal system was tribal, and all disputes were adjudicated by tribal headmen on the basis of traditional precedent.

For close to two centuries the Souliots remained largely untouched by any outside ruling influence. In 1790, however, Ali Pasha of Ioannina began a series of campaigns against them, with the intention of bringing them and their territories fully under his control. His initial attempt, in the spring of that year, was a disaster, and the following year he recruited the assistance of the neighbouring pasha of Berat, Ibrahim, to whose daughter his second son Veli was married. In July of 1792 Ali sent a message to two Souliot leaders, George Botsaris and Kitsos Tzavellas, ostensibly to gain their favour, but in reality to lure them into a trap. In the ensuing battle Ali managed to take Tzavellas's son hostage, but suffered great losses when he again attacked Souli.

Not until more than ten years later was Ali finally able to subdue the Souliots, and even then he did so only because of the betrayal of the Souliots by Botsaris, and not before losing many men over the course of a long-drawn-out battle with Souli, during which its residents were virtually starved by a blockade imposed on them by Ali's troops. In the course of the final rounds of battle between Ali's troops and the Souliots, the Souliot women inscribed themselves in folk memory through several acts of tremendous bravery and martyrdom. In the most famous instance, 50 women, who had been cut off from their men, and were certain to be captured by Ali's forces, threw their children off the edge of a cliff, then danced in turn over the precipice after them. Another group of women drowned themselves, along with their babies, in the White river on the way to seeking asylum in Parga, while a third group of women blew themselves up. All preferred death to falling into the hands of Ali Pasha, and personified Greek folklore's depiction of the Souliots as a fiercely independent people who preferred death to subjugation to any external power.

Summary

A group of villages in Epirus, Souli achieved a degree of independence during the Tourkokratia. Ali Pasha of Ioannina set out to subdue them in 1790 but it took him more than ten years to do so. The women of Souli are commemorated in folklore and song for their many acts of bravery and martyrdom.

South Africa

The 80,000-strong Greek community in South Africa today has a long history. According to existing South African archival records, there were at least 11 known Greeks in the country in 1860 and more than 30 in the early 1800s. At the turn of the 20th century Cape Town attracted growing numbers of Greeks, many of them sailors as well as tobacconists, small entrepreneurs, and adventurers. By 1905 there were over 1500 Greeks throughout South Africa. Greeks fought on both sides during the Anglo-Boer War (1899–1902). A large number of the pioneers in the Transvaal Province became miners and most of them died of miners' phthisis, a deadly progressive disease. The numbers of Greeks grew after World War II and reached a peak of over 120,000 in the mid-1970s.

Due to the "Liberal White Policy" of the apartheid regime of the National Party (which came to power in 1948) many Greek artisans and professionals arrived in the country with one-year contracts. Most of them established themselves later as entrepreneurs and contributed greatly to the economic development of the country. They brought with them individual and collective skills and entrepreneurial spirit of a high calibre. The crisis of the apartheid government and the Soweto riots of 1976 persuaded several sections of the Greek population to return to Greece, where they have established well-organized associations of a philanthropic nature.

Initially they started as small traders in the services and distributive spheres (fruiteries, cafes, general shops, etc.). There were also several small pioneer manufacturers of tobacco, mineral water, confectionaries, bricks, etc. Few were active in agriculture and farming. Many of their businesses were destroyed physically by large hostile crowds in the anti-Greek riots of 1917. These were caused by faction fighting among sections of the community over the attitudes of

Venizelos and King Constantine towards World War I. Political passions ripped the community apart during that period.

The development of the productive forces in the country was instrumental in shaping an ever-increasing upward mobility among Greeks in South Africa. Thus there was a notable transformation of the Greek entrepreneurs from a predominantly service and distribution mould into the broader spheres of the South African economy (building development, shipping, mining, high technology, financial services, etc.). Greeks still have wide control of the restaurant and leisure sectors, many Greek-led companies have entered the Johannesburg Stock Exchange, and it has been calculated that Greek-owned businesses produce over 8 per cent of the country's GDP. Over 200,000 people of all colours and creeds are directly employed by Greek-owned enterprises. There are several Greek and Cypriot banks operating in South Africa, the oldest being the South African Bank of Athens which was established in 1947. Intellectually, the Greek community in South Africa has produced a wide range of academics, researchers, and professionals in all spheres of society, many of them of international standing and reputation.

There is also a surprisingly rich tapestry of Greek culture in South Africa with large numbers of dance groups, theatre groups, musicians, poets, novelists, and the like.

In terms of communal organization, the Greek community associations (*koinotites*) are the stalwarts of development. The first was established in Cape Town in 1898 and the second in Johannesburg in 1908 following the amalgamation of several benevolent and nationalist groups. The Federation of Hellenic Communities and Associations of South Africa was established in 1975. Today there are 20 Greek communities in South Africa whose main aims are the preservation of the Greek language, Orthodox religion, culture, and traditions. There are also 14 brotherhoods and associations of people from different geographical areas, the first of which, for Ithacans, was established in 1906.

Greek education has a long history of struggle in South Africa. Today Greek language, tradition, culture, and history are taught in all community schools throughout the country and also in the South African Hellenic Educational and Technical Institute (SAHETI), which is a private school and one of the best in the country. The community school follows the programmes of the Greek National Education Ministry, which provides the bulk of the teachers.

The Greek press has played an important role in the social and national life of Greeks in South Africa. The first newspaper (*Apokalypsis*, later *Nea Hellas*) was established in 1902 in Johannesburg. *Afrikanis* was established in 1918 and is called today *Hellenikos Typos* (*Greek Press*, incorporating *Nea Hellas*).

Although the first pioneers were mainly from Ithaca and the Peloponnese, the composition today has changed radically. There are large numbers of Greek Cypriots as well as people from throughout Greece living and working in South Africa. Historically South Africa's Greek population has played an active part in all Greece's national struggles. A large number of Greek pioneers fought in the Balkan Wars, World War I, and World War II. Millions of dollars have been collected and sent to Greece and Cyprus during difficult times, especially the 1974 Cypriot tragedy.

Soutsos, Mikhail 1778–1864

The last prince of Moldavia

Soutsos was a descendant of one of the most famous families of Epirus with a long history reaching back at least to the late Byzantine period. The family was first recorded as being settled in Constantinople well before the fall of Constantinople to the Ottomans in 1453. However, after the fall of Constantinople, the Soutsos family among many others was obliged to leave Constantinople and return to Epirus. Yet, following the sultan's decree of 1470, the family once more made its way back to Constantinople. The Soutsos family was to produce a variety of celebrated figures who played an active role or offered their services either to the Orthodox patriarchate or to the Sublime Porte from the 17th century on. Other members of the family took on high office or became distinguished as diplomats, rulers, princes, military officers, or scholars.

Mikhail Soutsos was the grandson of M. Soutsos (b. 1730) who settled in the principalities across the Danube and served as ruler of Wallachia in the years 1783–86 and later as prince of Moldavia in the period 1793–95. Soutsos was born in 1778 at his grandfather's court in Wallachia where he was educated by private tutors. Having received the necessary qualifications and theoretical knowledge, he proceeded to put them into practice by undertaking important political and administrative duties and finally by presiding over the political department of the court. There he witnessed the beheading of his uncle, A.

Soutsos (1807), as well as the execution of the son of the grand interpreter of the princely court. The tragic deaths of these two eminent officers marked a turning point in Soutsos's political career. Almost immediately he succeeded them in their high positions and showed himself to be a resourceful and prudent leader in public affairs and diplomacy. In the meantime, he was appointed as the Wallachian prince's representative to Constantinople. In 1815 he was promoted to the office of the grand ambassador to the Sublime Porte, which he held until 1818 when he entered the advisory body of the sultan Mahmut II. In 1819 he accepted the throne of Moldavia and retained it till the outbreak of the Greek War of Independence (1821).

Soutsos made an enormous contribution to the inception, progression, expansion, and final fulfilment of the Greek cause, which he supported financially and morally. Not only did he encourage it but he supported it by whatever means were available to him. Soutsos, as prince of Moldavia, played an active role in and encouraged the sacred mission of the Society of Friends (*Philiki Hetaireia*), namely the liberation of Greece from the Ottoman yoke. For the attainment of that goal Soutsos was willing to sacrifice his own life and not only did he adopt the principal ideas of the Society of Friends but also he jeopardized his throne and his wealth. Soutsos joined the society in 1820, in the wake of Alexander Ypsilantis's revolutionary movement in Moldo-Wallachia and his subsequent triumphal entry into Jassy that signalled the beginning of the revolution. Since Moldavia occupied a strategic location, it was well suited to carry the seeds of the revolution which erupted there. Moreover, Soutsos could mobilize a significant military force consisting of Serbs, Vlachs, and Bulgars to assist Ypsilantis. It should be noted that, in addition to being a member of the Society of Friends and prince of Moldavia, Soutsos enjoyed the high esteem and support of the sultan.

Soutsos's moral contribution to the Greek revolution is incalculable. He followed the example of Constantine Ypsilantis, the prince of Wallachia some years earlier, who had supported the Serbian revolutionaries in the hope that their regional revolt would develop into a revolutionary movement throughout the Balkans against the Turks. When he joined the Society of Friends Soutsos offered a large amount of money to the revolution. By his example he persuaded other Moldavian princes and governors to contribute financially, militarily, and morally to the success of the revolution. In addition, he put his garrison troops at the disposal of the society and made himself responsible for their overall preparation as well as for supplying the Greek army with food, equipment, and other provisions. By risking his crown he succeeded in mollifying the Boyars, the Romanian notables who were against the revolution, as well as the uncooperative members of the society. When Ypsilantis's troops crossed the river Pruth and arrived in the capital of Moldavia, Soutsos announced his decision to abdicate, since there was no reason to keep his throne once the Greek revolution against the Turks had commenced. However, after Ypsilantis intervened, he remained prince of Moldavia for a while in order to prevent a possible scattering of his population. At the same time he collaborated with the leader of the society and undertook personally to recruit volunteers and to stockpile weaponry and munitions. Immediately after the failure of the revolution in the Danubian principalities and the public burning of the regal insignia, Soutsos was deported to Bessarabia, having been excommunicated by the ecumenical patriarch Gregory V for his involvement in the revolution. Meanwhile, the Sublime Porte repeatedly asked for Soutsos to be expelled from Russian soil in order to prevent the outbreak of a new Russo-Turkish war. Thus Soutsos was forced to live in exile in Austria where he was imprisoned for four years and was then banished to the neutral territory of Switzerland.

Soutsos's contribution to the Greek cause did not stop there but continued until his death. When in Switzerland he still served the Greek revolution he cooperated with Count Kapodistria and the philhellene community there, and he devoted his life to charities and the development of Swiss philhellenism. At the same time, he contributed to the spiritual renewal, enlightenment, and education of Greek refugees there.

After the end of the war and the establishment of peace in Greece, Kapodistria appointed Soutsos as the Greek representative to Paris. In that capacity he persuaded the king of France to give economic and military support to Greece. In fact, he sent 20,000 French soldiers to the Peloponnese to drive out Ibrahim's army. From Paris, Soutsos moved as Greek ambassador to St Petersburg (until 1835) and London (until 1839). That year he returned to Athens where he was appointed a member of the advisory body of the newly established Greek state.

Soutsos saw his dreams come true when the Greek people won their independence. Residing now in Athens, he bought a large area of land in one of the most fashionable suburbs of Athens which even today bears his name, and he built a mansion in which he lived till his death and which he bequeathed posthumously to the Greek state.

Biography

Born in Moldavia in 1778, Soutsos was educated privately at the court of his grandfather. At an early age he undertook political and administrative duties, becoming ambassador to the Sublime Porte and in 1819 prince of Moldavia. He assisted the Greek revolutionary movement in Moldavia and Wallachia. He abdicated in 1821 and was deported to Bessarabia. He later served as Greek ambassador to Paris, St Petersburg, and London. He died in Athens in 1864.

Spain

Spain occupies the major part of the Iberian peninsula. Iberia is the ancient name of the country and Iberians the name of the people who inhabited the peninsula in ancient times and who became urbanized from the 5th century BC. The first Phoenician settlement in Iberia, Gades (modern Cadiz, northwest of Gibraltar), is traditionally dated to *c.*1100 BC. However, archaeological finds demonstrate that this flourishing Phoenician trading settlement was not established until the 8th century BC. It minted coins down to the 1st century BC and initially traded for metals with Tartessus, a cultural agglomeration in southern Spain. Tartessus developed out of local roots, and from *c.*750 BC was exploiting the rich metal resources in the hinterland of Onoba (Huelva). These were traded with Phoenician settlements on the coast in exchange for metalwork, jewellery, ivory, and ceramics, all of which were in turn traded within Iberia. As a result of its close links with Phoenicians and Greeks in Iberia, Tartessus developed a unique orientalizing culture (expressed in sculpture, jewellery, and architecture, for example). Tartessus collapsed in *c.*550 BC for reasons that are still a matter of academic dispute.

Greek presence in the Atlantic regions of Iberia is traceable from the second half of the 7th century BC, especially in the Huelva region, where it is linked to Tartessian culture; it may also be identified in the same period in the northeastern regions of Iberia. From the last third of the 6th century BC, Greek presence in Huelva diminished and remained at a low ebb for the next 100 years. The Greek colonies in Spain were established by the Phocaeans. Of the three known colonies – Emporion, Rhode, and Maenace – the first, which was indeed the major Hellenic centre in Spain, has received the most detailed archaeological study.

Emporion, northwest of modern Barcelona, was founded *c.*600 BC at about the same time as Massalia (modern Marseilles). Initially a small settlement was established on an island, and in *c.*575 BC it moved to the shore of the mainland, an area populated by local people and set amid marshes. It is clear from finds of local pottery in the Palaiapolis and study of the city's necropolis that the population of Emporion included local people from its very beginnings. Emporion was also surrounded by the settlements of the local population; peaceful relations between colonists and natives were very important for ensuring the survival of the Greeks in the region. Iberian society was highly organized but not centralized. The Ullastret settlement, about 20 km from Emporion, housed the Iberian elite of the hinterland. Situated atop a hill, it controlled the whole of the territory surrounding Emporion. In consequence, the relationship between Emporion and Ullastret was not merely mercantile but political as well. It may be remarked that the city walls of Ullastret were constructed only about 500 BC, long after the final establishment of Emporion. In almost every house in Ullastret large quantities of Greek pottery were found. Greek influence is clearly discernible in the planning of the settlement, in features such as an acropolis with its own inner walls and small temples, and a porticoed marketplace.

Tivisa is another native Iberian settlement. It overlooks the Ebro river, controlling access to the Iberian interior. It has very strong fortifications and a gateway closely modelled on Greek plans of the 4th century BC. Here more Greek pottery was found. These two settlements are evidence of the close and peaceful relationship which the Greeks enjoyed with the Iberian elite who, from well-fortified settlements, controlled the hinterland so vital for Greek trading activity. The Emporitans could expect little benefit from the marshy territory immediately around them. In the southeast of the Iberian peninsula the most important illustrations of Graeco-Iberian relations are the local settlements of Porcuna and Castulo, as well as Huelva.

Although strongly indigenous, Tartessian/Iberian culture was more Phoenicianized than Hellenized. Further Greek influence can be traced from the 4th century BC when, with the fall of the Punic world to Rome, Iberian–Phoenician links became sparse. Ionian influence on Iberian stone sculpture is obvious. Most probably, local, very Hellenized sculpture workshops existed in Castulo and Obulco. In them it is possible that Greek and local craftsmen worked alongside each other, the former adapting their artistic skills to the tastes of the local elite, and the latter working under Greek instruction. Tomb monuments show Anatolian influence (which came via the Ionians); important in this respect are funeral stelae which carry depictions of Ionic columns. Iberian small bronze figures as well as silver gilt *phialai* (libation bowls) from Tivisa and Santiesteban show Greek influence.

Graeco-Iberian script is another aspect of the Hellenization of the Iberian elite and society at large. It uses the Ionian alphabet. The earliest inscription dates from the second quarter of the 5th century BC. The script was widespread in the Hellenistic period, especially after the 2nd century BC. It is found not only at local sites but also in Emporion, on both Greek and local pottery.

Spain first experienced a Roman presence at the very end of the 3rd century BC. In 197 BC Rome divided its possessions in Iberia (or Hispania, as it was known to the Romans) into two provinces: Hispania Citerior, the eastern coastal strip; and Hispania Ulterior, the southeast coast and the Guadalquivir valley. The conquest of the peninsula was completed by Augustus in the Cantabrian Wars (26–19 BC). Twenty-two colonies were founded under Caesar and Augustus. In the 1st century AD many provincial Roman senators came from the colony of Hispania; and several emperors – Trajan, Hadrian, and Marcus Aurelius – could boast Spanish ancestry. The barbarian invasion of 409 resulted in the rapid loss of Roman control of all the Spanish provinces. By 475 Spain was finally lost to Rome. Visigothic control was established in 586 and lasted until the early 8th century, although part of the south of Spain was held by the Byzantines from 552 to 624. In conse-

quence some Greek traditions survived. However, the south of Spain was to be that part of the peninsula which remained longest under Arab control (from the 8th to the late 15th century) and it is that which has left a stronger legacy.

Sparta

City in the Peloponnese

Sparta was the controlling city of Laconia, the southeastern part of the Peloponnese, situated in an extremely fertile area well watered by the river Eurotas. There was a Mycenaean settlement in the vicinity, on the hills above the opposite bank of the river, quite substantial, but hardly comparable with the great palaces of Mycenae, Tiryns, or Pylos. It may or may not have been the residence of the Mycenaean king who is personified in Homer's *Iliad* and *Odyssey* as Menelaus, the husband of Helen and brother of Agamemnon himself.

Classical Sparta was founded by Dorian settlers who moved in during the confused period after the collapse of the Late Bronze Age political systems. They avoided the previous settlement, which was later marked by a sanctuary dedicated to Menelaus and Helen (the Menelaion) and instead occupied a series of sites on the west bank, where they founded four villages. These merged, by some totally unknown process, into a single political entity which, along with a fifth village at Amyclae a short distance to the south, became the city, though for a long time – certainly until the 5th century BC when Thucydides wrote – it remained in physical terms a cluster of villages. According to Thucydides, it is clear that in his time it was distinctly a non-monumental place, in contrast to his own and other cities of his day.

The Dorian settlers brought with them a primitive constitution, paralleled by those of other settlements, particularly in Crete, which were founded or refounded at the same time as a result of the Dorian migration. It aimed to confirm the military effectiveness of the political body. In adolescence, young men were taken from their families and lived in communal groups, where they underwent a rigorous regime of physical and military, rather than intellectual or academic, training. The effectiveness of this was enhanced by the development of the heavy infantry armour and fighting method of the hoplite type of warrior. By the 6th century BC the Spartan army was generally recognized as the most efficient fighting force in Greece, a reputation which was confirmed by the part it played in defeating the Persian invasion. The total normal strength of the army was 5000, all full citizens of the city. Citizenship was restricted to those who underwent the training regime and served in the army, in effect the adult male population of the five constituent villages. Its function was not so much to ward off external enemies (not merely the Persians, but other Greek city states, particularly Argos) as to maintain a supremacy over Laconia and, by conquest, the district to the west, Messenia. This involved another distinctive element in the Spartan system, the allocation of landed estates away from the city itself to its citizens, who were entitled to the products of their estates, but which were farmed for them by subservient workers, the helots ("captives"), who were tied to the land. This freed the Spartan citizens from the necessity to work for their living, and allowed them instead to dedicate themselves to military training. Part of the food produced by their estates had to be given to the military group to which they belonged, and where they normally ate, rather than at home.

The reason for this system is unclear. In the training and communal meals there is a primitive, tribal element; but when it first emerges, it is devoted to a supremacy which enabled the Spartans to trade agricultural produce for luxury items imported especially from the east, a phenomenon to be found in other contemporary Greek cites, Corinth most clearly. Items such as pottery, metalware, and so forth were also produced in Laconia itself: examples have been found in the Archaic levels at the sanctuary of Artemis Orthia on the banks of the Eurotas, and at the Menelaion, along with ivories and other imports. There must therefore have existed an artisan class, though who they were and where they lived is uncertain. They are usually attributed to a third political category, the "dwellers round" or *perioikoi*, communities which enjoyed local independence (i.e. they were not tied helots), but were under political obligations, particularly of rendering military assistance, to the Spartans. Their numbers, when called upon, seem to have doubled the size of the Spartan army. However, the Spartan army was needed more and more, particularly after rebellion by the Messenian helots, to police and maintain the Spartan constitutional supremacy. It became self-devouring: military supremacy was needed to maintain the training and living systems, which were themselves needed to maintain military supremacy. Thus it had become an end in itself. This led to a tightening of the regime, and in particular a rejection of luxury and personal wealth. Strengthening the system meant its maintenance, and innovations were frowned on: Sparta notoriously did not issue its own coins, since coinage had been invented to facilitate commercial development.

As a result, Sparta emerges as the natural antithesis of Athens: restricted constitution in contrast to democracy, military prowess as opposed to naval development, self-sufficient instead of relying on trade and imperial exploitation. It even kept its curious institution of a dual kingship, at a time when most Greek states no longer had kings. It is a contrast which, in its political application, led to war.

Sparta: view of the plain of Sparta from the castle of Mistra

Sparta failed because it was not equipped to deal with the problems which faced the wider Greek world, particularly the need to maintain a constant defence against the possibility of a Persian resurgence. The consequences of this can be seen in the strains imposed on Sparta when it tried to sustain this role in the first half of the 4th century BC. The loss of Messenia, liberated by the new- style Boeotian army, crippled it permanently. This and other strains led to a steady decline in numbers of the citizen population able to draw from their estates to contribute to their military groups: the problem may have been exacerbated by a primitive system for deciding inheritances. The number of subordinate helots (except for those lost with Messenia) and *perioikoi* does not seem to have declined, and a new group, the "inferiors", grew up in Sparta itself, former citizen families who had lost the necessary property qualifications.

At first, this diminished Sparta stands outside the new order created by Philip II and the Macedonians, largely ignored because it was unimportant, though generally managing to remain independent. Land passed into the hands of an extreme few, usually through female inheritance, and Sparta was regarded as a mere has-been. All this ended with social reform introduced by King Cleomenes III. In this he confiscated all the land and redistributed it into new estates, on the pretext that he was restoring the original Spartan system. The new landholders were, at the same time, liable to military service, and so a new and briefly powerful Spartan army was created. It failed, at the Battle of Sellasia in 222 BC against the superior Macedonian army of Antigonus Doson, and Sparta relapsed into insignificance.

However, it was an insignificance with a distinguished past. As part of the Roman empire Sparta flourished, in the form of a small but prosperous provincial city. It traded on its traditions. The training regime was partly revived, though the harshness, which included whipping the youths, became something of a spectacle, and a theatrical structure was built at the sanctuary of Artemis Orthia so that an audience could observe. The town itself included wealthy families, some of them newly arrived, and houses with lavish mosaic floors have been excavated. A substantial theatre was built in the 1st century BC and subsequently enlarged. In the troubled times of the late empire, and for the first time, fortifications were constructed, delimiting a much-reduced area, and these maintained the place into the Middle Ages until the population was transferred to the stronghold of Mistra, away from the river in the foothills of Mount Taygetus. Such, however, was the reputation of ancient Sparta that, with the freeing of Greece from the Turks, Mistra was abandoned and new Sparta refounded yet again in its old place.

Summary

A city in the southern Peloponnese, Sparta was the site of a Mycenaean settlement, in Homer the residence of Menelaus. The Classical city, originally a collection of villages, was a Dorian foundation. By the 6th century BC the Spartan army was the best in Greece. But the military system could not deal with wider political problems and ultimately failed. In the Middle Ages the population was transferred to Mistra, but in the 19th century Sparta was refounded on its original site.

Spells

The vocabulary of casting spells comprehends the terms *epoide*, literally a "singing over", and *pharmakon*, a broad designation that straddles the notions of incantation and drug (medicine or poison, possibly enchanted) and which could be extended to describe any psychagogic force: Plato in particular assimilated the power of the spellbinding word to the power of poetry or rhetoric, both of which deprive their objects of the capacity for autonomous action (*Charmides*, 157a; *Republic*, 607d; *Meno*, 80a; cf. Gorgias, *Encomium of Helen*).

Spells were ubiquitous in ancient Hellenic society. More than 1500 incised tablets associated with spellbinding survive from antiquity as do many incised ostraka and amulets, while the *Papyri Graecae Magicae* (*PGM*) of Hellenistic Egypt, dating from the 3rd and 4th centuries AD but informed by long-established practice, constitute a veritable magician's handbook. Individuals seeking supernatural aid could buy spells from professionals; Aristophanes claims that the witches of Thessaly (an area famous for witchcraft) charged a fee (*Clouds*, 749–52) and Plato suggests that such specialist services came cheap (*Republic*, 364c).

Incantations were accompanied by various practices that served to reinforce the power of the spoken word. One important supplement to the oral spell from the Classical period onward was the process of inscription – the performance of writing down the name of the victim and that of the god or demon invoked to work the spell lent greater efficacy to the accompanying words. Inscriptions could be empowered further by the addition of the inscribed images of humans, animals, and demons and of arcane astrological symbols and mystical numbers; often the words themselves were written backwards, mixed up, or repeated. The language of spells was highly formulaic and sometimes specifically magical; "nonsense" words comprehensible only to demons could be used, such as "abracadabra", attested for the 1st century AD, and the Ephesian *grammata* ("letters"), recited or inscribed in apotropaic rituals.

Herbs and plants, often pharmacologically active, were used in spells, as were minerals and the body parts of animals – the *PGM* record many charming recipes; and personal effects of the victim such as hair, nails, or clothing were employed synechdochically. Magic tools were used, for example the *iunx* (a bronze whirling disc), bull-roarer, and gong, while in the *Odyssey* Hermes, Circe, and Athena have magic wands (13. 429, 16. 172, 456). Voodoo dolls of wax, mud, or dough representing the victim of the spell and often inscribed with his or her name were a common feature of spellbinding. These figurines could be placed in graves, burnt, melted, or transfixed with nails (*PGM*, 1. 83–87 suggests the insertion of 13 needles) and sometimes had their hands tied behind their backs. Indeed the vocabulary of bondage, such as *katadein* (tie down) and *katechein* (restrain), is prevalent in spells – more than 1000 examples of ancient binding spells (*katadesmoi*) have been found, and as late as the 12th century AD Eustathios was familiar with the idea. The concept of binding the victim is important, a notion perhaps related to the bonds of fate and a demonstration of the appeal of sympathetic magic – the victim is bound to the speller's will and rendered powerless. The frequency of curses resulted in their corollary – antidotes: *PGM* 4. 2177 offers a spell to break the power of a curse tablet; many inscriptions suggest remedies to ward off the anger of one's enemies (for example *PGM*, 7. 940–68, 4. 831–32); others have a more general apotropaic function. Of course the notion of magic could be used as a method of saving face: failure in anything from litigation to love could be ascribed to a malignant spell.

Often spells are agonistic in context. Many Athenian *katadesmoi* relate to lawsuits and represent an attempt to silence opponents in court: an inscription on a lead tablet from the 5th century BC calls down a curse upon Aspasia and her legal helpers (*Inscriptiones Graecae*, 3. 3106), while the "binding song" (*hymnos desmios*) of Aeschylus' Erinyes occurs in a legal context (*Eumenides*, 306ff.). Other spells relate to success in athletics, the theatre, and business, while many promise to endow the speller with a more general appeal and success (e.g. *PGM*, 12. 397–400). Another important locus of enchantment was love, and *agogai* – rituals designed to lead the beloved to the speller's bed – form a large part of the literature on spelling. Theocritus' *Pharmaceutria* (3rd century BC), a portrait of an abandoned woman attempting to bewitch a former lover, echoes the sympathetic erotic magic of contemporary practice – the melting of a wax dummy, the burning of a thread from the victim's cloak, the use of magical tools, and an incantatory refrain.

In Greek literature it is women in particular who cast spells and are skilled in the use of *pharmaka*, while bewitchment is often troped in terms of the characteristically female activity of weaving – Medea, ancient literature's most infamous witch, weaves spells and invokes demons (Apollonius Rhodius, *Argonautica*, 4. 1635–90). Yet the spells in the *PGM* are addressed more often to male practitioners, and their use crossed the boundaries of gender and status.

Spells were not used only to harm: some of the earliest references to incantation in Greek literature occur in a medical context. In the *Odyssey* Autolycus and his sons bind Odysseus'

wound and sing incantations over the dark blood (19. 457) and Pindar's Cheiron heals with incantations, *pharmaka*, and surgery (*Pythian*, 3. 43–54). Indeed the distinction between magic and medicine in antiquity is blurred: amulets (*periapta*, *periammata*) applied with incantations were worn as remedies for or prophylactics against disease (e.g. as a cure for headache, Plato, *Charmides*, 155e–156e); healing with spells is mentioned (and disparaged) in a text belonging to the Hippocratic corpus (*On the Sacred Disease*, 1–2); Plato says midwives use *pharmaka* and *epoidai* to induce labour (*Theaetetus*, 149c–d). The distinction between magic and religion is arbitrary too: many spells were in prayer form. Plato claims that sorcerers persuade the gods to serve them by prayers (*euchai*) and *epoidai* (*Laws*, 909b; cf. *Republic*, 364c) and Sappho's prayer to Aphrodite has the tone of an erotic magical spell (fr. 1 L-P). Indeed the whole pantheon of Greek gods was invoked in incantations in which supernatural powers were compelled to serve the speller, although Hecate, Persephone, Selene, and Hermes figure most prominently.

In ancient Greece religion and "magic" were not mutually exclusive categories and no legislation of pagan antiquity relates directly to spells (although Plato suggested that "black magic" should be criminalized, *Laws*, 933a). The Church, however, ideologically mandated against all non-Christian "magic", and spells fell outside its orthodox circumscriptions. Paul made the Ephesians burn their magic books (Acts 19: 18–20) and the use of spells was condemned by patristic writers such as Basil (*Epistles*, 188. 8), Eusebius (*Laus Constantini*, 13), and Jerome (*Life of Saint Hilarion the Hermit*, 21), while the Theodosian code (9. 16. 4) outlawed the use of magic and prescribed death for its practitioners. The Church's proscription of practices it labelled un-Christian led many to seek supernatural consolation in Christianity but a belief in pagan magic, the efficacy of spells, and the power of the evil eye persisted in Hellenic society throughout the medieval period and beyond into the modern era; indeed Dionisopoulos-Mass records a tale of magical intrigue which took place on the Aegean island of Nisi in 1968 when a husband, rendered impotent by a malicious spell, successfully sought help from a professional witch in Athens.

Sphrantzes, George 1401–1477/78

Diplomat and historian

As a young man George Sphrantzes entered the service of the emperor Manuel II (1391–1425) and later of Constantine XI (1449–53), whom he accompanied and served as a friend and adviser until the emperor's death during the capture of Constantinople. Sphrantzes carried out several diplomatic missions, to the Turks, Georgia, Trebizond, the Morea, and the Aegean islands. He saved Constantine's life during the siege of Patras, but was captured and imprisoned (1429). After his release and the final surrender of the inhabitants of Patras, he became governor of the city. He was appointed *protovestiarites* (chief of the sovereign's bodyguard) in 1432 and governor of Mistra in 1446. After the fall of Constantinople in 1453 and his release from captivity by the Turks, he joined Constantine's brother Thomas in the Morea and after the final Byzantine defeat followed him to Corfu, where at the end of his life, tired and sick, he entered a monastery. There, Sphrantzes wrote down a personal account of the events that took place during his lifetime, the so-called *Chronicon* (*Minus*). His work is based on a diary and annalistic source material as well as on oral tradition. Sphrantzes focuses on his own experiences and on the person of Constantine Palaiologos, his devotion to

whom is obvious in the whole account. The language of the *Chronicon* is remarkable because it is surprisingly simple and colloquial. Some narrative passages, such as the account of the events that led to his appointment as governor of Patras and the biography of his godmother Thomais, may be regarded as early examples of modern Greek prose writing. The *Chronicon* has some characteristics in common with traditional Byzantine historiography, but differs substantially through the use of informal language and in the extraordinary density of autobiographical elements. Because no addressee is mentioned, we can surmise that the *Chronicon* was intended for members of the former Byzantine ruling elite living in exile after the fall of Constantinople, probably for the circle of refugees around the despot Thomas Palaiologos. Sphrantzes's original work is preserved in a slightly revised version represented by six independent manuscripts, two of which originated in the 1570s, one in the 17th century, and three deriving directly from one of the two 16th-century copies. Through the centuries of Ottoman rule Sphrantzes's account proved a "living text" that was changed and reshaped according to the needs of the period.

In Naples, between 1573 and 1578, Makarios Melissenos (Melissourgos), metropolitan of Monemvasia, composed a historiographical work for the years 1258–1477 in four books. For this compilation he used several authentic, and some forged, sources. Melissenos's text is primarily based on Sphrantzes and supplemented by material from Byzantine and post-Byzantine historiography, for example Georgios Akropolites, Nikephoros Gregoras, and Manuel Malaxos. He presented it as the work of Sphrantzes, so that the true identity of the author was unknown until the research of Ioannis V. Papadopoulos in the 1930s revealed it; previously it was, and sometimes still is, referred to as "pseudo-Sphrantzes". Traditionally Sphrantzes's authentic work has been known as the *Chronicon Minus* to distinguish it from Melissenos's *Chronicon Maius*. A large part of book 3 of Melissenos's compilation is formed by the famous so-called siege section, an account, purportedly by an eyewitness, of the last days of Constantinople. This passage is probably based on the eyewitness account of Leonard of Chios (d. 1459?; originally composed in Latin), though the authorship is still disputed.

Melissenos's compilation may claim independent value because of the author's critical use of the material but also because of his obvious effort to reshape Sphrantzes's original text according to the norms of Byzantine chronography, expanding the chronological frame, and enriching the text with material concerning ecclesiastical history and dogmatic questions as well as natural phenomena. The compiler also attempted to make the language look more like ancient Greek, replacing demotic forms with archaic ones, and occasionally intervened to try to improve the understanding of the text – it is also because of these changes that among historians of Byzantium Melissenos's compilation has often enjoyed higher authority than Sphrantzes's unpretentious original text. We may surmise that Melissenos's ultimate aim was to alert the western powers to the Turkish threat and the suffering of Greece after the victory at Lepanto (1571) when they seemed inclined to a peaceful arrangement with the Ottoman Porte. Instead of being regarded as nothing but a forgery Melissenos's work deserves to be viewed as a creative reworking and a link between Byzantine and modern Greek literature.

Melissenos's creation, due to its historiographical content, literary form, and not least the fact that in the forged additions to the authentic material the author ascribed a prominent role in history to members of influential Neapolitanian families, obviously met the taste of his time as well as of later centuries, and therefore attracted a wide and continuing readership. As many as 27 manuscripts of pseudo-Sphrantzes have been discovered so far. These can be divided into two groups: 7 date to the end of the 16th century and are directly or indirectly connected to the circle of scribes around Makarios Melissenos, representing different stages of a continuous process of reworking of the original text; 15 date to 18th century – a fact that might be linked to intensified literary activities at this time (in particular at the Phanariot courts of Bucharest and Jassy) and growing interest in the history of the Greek nation, in particular in the fate of the Palaiologan dynasty and other families of the Byzantine aristocracy.

Besides being a major source for Greek history of the last 50 years before and the first years after the Ottoman conquest of Constantinople, in the 20th century Sphrantzes' *Chronicon* also exerted some influence on modern Greek literature. The politician, sociologist, and writer Panagiotis Kanellopoulos used his text (in the form of the *Maius*) and other contemporary sources for the composition of his novel *Gennithika sto Chilia Tetrakosia Dyo* (*I Was Born in 1402*, first published in 1957).

Biography

Born in 1401, Sphrantzes served Manuel II and later Constantine XI as a diplomat and adviser. He became governor of Patras and later of Mistra. After the fall of Constantinople he travelled widely and finally settled in Corfu. There he wrote his *Chronicon* (*Minus*), an account of the events of his lifetime from 1413 to 1477. The expanded version, *Chronicon Maius*, is probably the work of a 16th-century bishop of Monemvasia. Sphrantzes died in Corfu in 1477/78.

Sporades

Islands in the northwest Aegean

The Sporades comprise a cluster of four islands and a number of rocky islets in the western Aegean Sea, extending in longitude from Thessaly to Euboea. The three main islands – Skiathos, Skopelos, and Alonnisos – lie southeast of the Magnesia peninsula, while Skyros is situated further south, northeast of the midpoint of the island of Euboea. Their geographical location has determined their administrative position, making Skyros part of Euboea while the other three belong to Magnesia.

Although the islands have a common history, each is known for its own character. Skiathos has a cosmopolitan ambiance; Skyros is well known for its rich local folklore; Skopelos is famous for its outstanding churches; and Alonnisos for its scenery.

Skiathos is the closest of the four to the mainland, situated opposite Mount Pelion about 43 nautical miles from the port town of Volos. It covers a surface of 48 sq km and is populated by little more than 4000 people. Endowed with a large number of lovely beaches and a pine-filled landscape, it has long been one of the most attractive tourist destinations of Greece. Of the nine small islands surrounding its coastal waters, two with the name Tsougries lie across the main harbour, making it a safe haven for small boats and yachts.

The island's strategic location was a principal reason for its being conquered by a long succession of rulers since antiquity. During prehistoric times, it was inhabited by Pelasgoi who came from Thrace in northern Greece around the 12th century BC. It is hypothesized that Cretans of the Minoic age also inhabited the island. This idea is supported by the name of the island, which is very similar to "Skianthios", the Cretan name for the god Dionysus. Thessalians of the Mycenean age may also have been among the early settlers. Ionians and later Chalcidians colonized it by the 6th century BC. In 477 BC Skiathos became a member of the Delian League to gain protection from Persian invasion. Initially city members of the alliance were autonomous and had a democratic administration, but Skiathos came increasingly under the direct rule of Athens, until it passed into the control of Sparta following its victory in the Peloponnesian war in 404 BC. The Antalkidios peace treaty in 386 BC gave the island its official independence, but Sparta violated the agreement and Skiathos was again under their hegemony. In 378 BC the island regained its autonomy by becoming an ally of Athens and taking part in the second Athenian Alliance. During almost 40 years of this alliance, Skiathos enjoyed a remarkable economic prosperity, a sign of which was the privilege of minting its own coins. The Macedonian victory in the battle of Chaeronea in 338 BC signalled the beginning of Macedonian occupation. During the second Macedonian war in 199 BC, Philip V completely destroyed Skiathos and Skopelos so they would not fall into the hands of the enemy Roman fleet, which nevertheless reached Skiathos and completed its devastation. A quick recovery followed and the island obtained a democratic regime in 197 BC. When Greece was subjugated by Rome in 146 BC, Skiathos followed the fate of the rest of the country. In 42 BC, after the battle of Philippi, Mark Antony handed the island over to the Athenians as a token of appreciation for their assistance.

After centuries in the Roman empire, Christianity came to Skiathos in AD 325 and in 530 the first church, Agia Triada, was built. The history of the island in the Byzantine years has not been documented in detail, though it is known that it belonged administratively to the province of Thessaly. During the 7th century the island suffered much from Saracen pirate raids. When Constantinople was seized by the Fourth Crusade in 1204, Skiathos, like most of the Aegean islands, was taken by the Venetians. From 1207 to 1454 Skiathos was the property of the Venetian Ghisi family, which built a fortress in 1270 in Bourtzi, a charming quarter of the capital. In 1537 the island was conquered by Haradin Barbarossa and the Turkish navy. Skiathots, like all Greek islanders, used their naval resources and creativity ro aid the struggle for independence that started in 1821. Two years later the island was liberated.

Its capital Skiathos has stood in the same position since antiquity. It was briefly abandoned when its inhabitants moved north to a fortress for security during the precarious times of the Turkish dominance of the Aegean. This fortified capital, Kastro, is best visited today by boat. It provided respite to the Allied forces on their way to the Middle East during World War II. Of the 30 churches once inside the castle, only 3 remain. Several other churches and monasteries dot the island. An unspoiled strip of coast is known as "the port of Xerxes" because during the campaign of the Persian king in 480 BC three Greek ships were waiting here to confront his fleet. The island was the home of two short story-writers, Alexandros Papadiamantis (1851–1911), whose birthplace may be visited, and Alexandros Moraitidis (1851–1929), who towards the end of his life found refuge in the 18th-century monastery of St Charalambos on the north side of the island.

Skopelos (Greek for "steep rock from the sea" because of its rugged coastline) is almost twice as large as Skiathos and has about the same population. It is situated between Skiathos and Alonnisos and, like Skiathos, has frequent connections with Volos and Euboea. Its land is mostly flat with only a few low mountains. Pine trees abound and the local prunes are famous. The verdant landscape, the domestic architecture, and the churches are the chief attractions of this island.

Its present name appeared first in the Hellenistic period. Previously the name Peparithos was used. Legend has it that Peparithos with his brother Staphylos, sons of Ariadne and Dionysus, landed on the island with a group of Cretans in the bay known as Staphylos to this day. Staphylos, who became the first king, was buried there in a grave which was discovered in 1927. The finds – a gold crown, funerary offerings, and

weapons – are displayed in the museum of Volos. During historical times Skopelos was inhabited first by Mycenaeans between 1600 and 1100 BC and later by Chalcidians between 700 and 500 BC. As a member of the Delian League it was ruled by Athenians until 340 BC when it came under Macedonian dominance, which continued until 168 BC when Athenians took over once again. The Ghisi family owned the island during the Venetian occupation and built a castle with a magnificent view over the ruins of the ancient citadel. In 1537–38 Skopelos shared the fate of Skiathos, being sacked by Barbarossa and by the Turks under whose occupation it remained until the revolution, during which its fleet played an active part in the struggle for liberation.

Its main town, Skopelos (Chora), is built on a bay in the southeast, winding in tiers from the quarter of Kastro down to the shore with its gleaming white two- or three-storeyed houses, narrow cobbled streets, quaint alleys, and a plethora of churches, chapels, monasteries, and convents. Chora alone has 123 churches; there are 360 on the island as a whole. Notable also are its 12 whitewashed 17th- and 18th-century convents.

Alonnisos to the east of Skopelos is an oblong island with a hilly landscape covering an area of 64 sq km and is populated by slightly more than 1500 people. It is the least developed of the Sporades and therefore the least visited. The sea surrounding the coastline is designated a marine conservation park to protect the Mediterranean seals which have chosen the coves of smaller islands near Alonnisos as a haven. An earthquake in 1965 damaged the earlier capital, Alonnisos, and most of the inhabitants abandoned it and resettled 5 km to the east near the sea. The present port capital of Patitiri is on the southeastern side, 68 nautical miles from Volos and 35 from Euboea. The same earthquake split the centre of the island into two small islets – Psathoura (the remains of ancient Alonnisos) and Psatharopoula. Both lie submerged.

Signs that Alonnisos was inhabited in prehistoric times were found at Kokkinokastro and on the islet near it. The earliest palaeolithic finds in the Aegean were discovered here: animal bones and stone tools dating from 100,000 to 33,000 BC (Middle Palaeolithic period). The island was known as Ikos in antiquity, and the names Chelidromia and Diadromia were used later. A variation of these, Liodromia, is heard even today. According to mythology Peleus, father of Achilles, spent the last years of his life in Ikos and was buried on the island. Statues, tombstones, potsherds, and wine bottles from Ikos have been preserved at Kokkinokastro. The Athenians maintained a naval base there, stimulating the interest of Philip II of Macedon to bring the island under his rule. In 1538 Barbarossa and the Turks did not spare the island from plunderous attacks.

Alonnisos is surrounded by a host of tiny islands, the largest of which are Peristera and Lehoussa on its eastern side. On the small island of Youra to the northeast the Cyclops' cave with multicoloured stalactites and stalagmites is worth visiting.

Skyros, the largest in the group with an area of 209 sq km and a population of almost 2800, is the closest to Euboea, which is only 24 nautical miles away. Its capital, Skyros (Chorio or Chora), is close to the sea on the northeastern coast, while its port, Linaria, is located on the western side 11 km from the capital. The stark antithesis between the northern and southern parts of the island creates a natural divide connected by a narrow isthmus. Most of the population is concentrated in the northern, verdant part, since the southern, rocky side is virtually inaccessible. The island's vernacular architecture, its rich local folklore, and the diversity of its scenery give Skyros its unique character.

Archaeological finds reveal that the island has been inhabited since the neolithic period (5000 BC). Ancient legend considers its citadel to be the place where Thetis, Achilles' mother, hid her son disguised as a maiden among the daughters of king Lycomedes so that he could avoid the draft in the Greek campaign against Troy. Another legend claims this as the place where Theseus, king of Athens, met his death. Between 469 and 340 BC Athenians colonized the island and during Cimon's rule they divided the land in lots. Macedonians succeeded in taking over the island and kept it until 196 BC; the Athenians took it back and later passed it over to the Romans. Like Skopelos it served as a place of exile in the Byzantine period. The Ghisi family owned it during the Venetian rule until Barbarossa sacked it in 1537 and facilitated the Turkish conquest. It was liberated in 1829. A witness of its continuous history since prehistory is the fortified acropolis around which the present capital is built. A castle was erected on the site of the ancient citadel. At the castle the restored church of St George has dominated the island since its foundation in 963 by the emperor Nikephoros Phokas as a *metochion* (dependency) of the monastery of the Great Lavra on Mount Athos. The houses of the island with their carved wooden furniture and decor, the pottery, the handwoven household items and embroideries exhibit a faithful continuation of a strong tradition in folk art. Beyond the castle to the north in a square overlooking the sea stands the bust of the British poet Rupert Brooke (1887–1915) who is buried on the south coast at Treis Boukes. In the south one may chance upon some of the indigenous ponies that can be found only on this island.

Summary

A group of four islands and numerous rocky islets in the northwest Aegean. The main islands are Skiathos, Skopelos, Alonnisos, and Skyros. In the 5th century BC they belonged to the Delian League. From 1207 to 1454 they were owned by the Venetian Ghisi family. In 1537 they were sacked by Barbarossa. Though sharing a common history, each island preserves its own character.

Stephan IV Dushan

Ruler of Serbia in the mid-14th century

A Serbian king and self-styled emperor, Stephan IV Dushan (1331–55) led the southward expansion of the Serbian state and tried to build a Graeco-Slavic empire modelled on Byzantium. He had spent seven years of his youth in Constantinople with his exiled father Stephan III Decanski (1321–31), and he had obtained there a first-hand knowledge of Byzantium. After the assassination of his father by Serbian nobles in 1331, he acceded early to the Serbian throne. The land-hungry Serbian nobility was both the motive force behind Serbia's expansionist drive and the main cause for the rapid disintegration of the Serbian empire after Dushan's death.

The internal difficulties of Byzantium and the Black Death that struck in 1348 greatly facilitated the Serbian success. At the onset of the second civil war (1341–47) in Byzantium, the imperial pretender John Kantakouzenos allied himself with the Serbians against the regency government of John V Palaiologos. When Kantakouzenos found military support among the Greeks in Thessaly, he abandoned the alliance with Dushan, but the Serbs continued to plunder Byzantine territories on their own. Southern Macedonia fell into Serbian hands in 1345, and was followed by Thessaly and Epirus in 1348. After the fall of the city of Serres in 1345, Stephan Dushan began to style himself emperor of the Serbs and Romans. In the following year, on Easter Sunday, he had himself crowned emperor at Skopje by the archbishop of the Serbian Church whom he had elevated to the rank of a patriarch. Dushan sought legitimacy for his title among both the Greek and the Slavic population living under his rule. The coronation was witnessed by the Protos (head of the community) and the abbots of the monasteries of Mount Athos. Dushan generously endowed the Athonite monasteries with lands and privileges and he himself spent several months in the Serbian monastery of Chilandar in 1347–48.

As *basileus* (king) and *autokrator* (emperor) of the Serbs and Romans Dushan intended to take over Constantinople and make himself master of the Byzantine empire. The seriousness of his intentions is seen in the fact that he offered Venice possession of Galata and the whole of Epirus if the Italian republic would help him to storm Constantinople with its fleet. The dream of the conquest of Constantinople was never realized and Dushan died in the last stage of his preparation for assault on the imperial capital. Nevertheless, his advance into the Balkans in the late 1340s and early 1350s met with extraordinary success. By 1355 the Serbs controlled Albania, Epirus, Thessaly, Aetolia, and Acarnania. Their empire stretched from the Danube to the Gulf of Corinth and from the Adriatic to the Aegean Sea. Byzantium lost half of its territory, retaining only Thrace, the Peloponnese, Thessalonica, and Constantinople.

Stephan IV Dushan introduced Byzantine influence into Serbian administration, court ceremonial, and law. The process of Hellenization of Serbian court life and administration had begun already in the late 13th century when the Byzantine princess Simonis came to the Serbian court as wife of Stephan II Milutin (1282–1321). In Dushan's day, Serbian administrators became increasingly adorned with Byzantine titles. Dushan minted silver coins that closely followed the Byzantine model. Churches and monasteries in his empire were decorated in the best Byzantine style. Furthermore, the emperor attempted to merge the legal traditions of the Serbs and the Byzantines. By his order, the *Syntagma* of Matthew Blastares (a collection of both secular and ecclesiastical rulings), written in 1335, was translated into Serbian shortly after its composition. Dushan's code of law, the *Zakonik*, promulgated in 1349 and reissued in 1354, was based partly on Byzantine legal models. It proclaimed the equality of Byzantines and Serbs, and reconfirmed privileges conferred on Greek cities by past Byzantine emperors.

Still, Stephan Dushan was less successful as a state-builder than as a conqueror. This was due primarily to the ambitions of his nobles, but also to the ethnically heterogeneous character of his empire. The Serbian conquest was too rapid and too violent, while the conquered Byzantine population could hardly accept an emperor of the Romans outside Constantinople. Although Dushan tried to accommodate Greeks in his state, the important administrative offices in the conquered territories were held by Serbian nobles or by members of Dushan's family, all decorated with Byzantine titles. His son and heir Stephan V Uroš (1366–77) lacked the energy of his father and saw the disintegration of the Serbian empire into a medley of small states. Stephan IV Dushan's half-brother Uroš carved for himself a principality in northern Greece with a capital at Trikkala and proclaimed himself tsar of the Romans, Serbs, and Albanians. Uroš was a generous benefactor of the monasteries of the Meteora, which would become an important centre of Orthodoxy during the period of the Tourkokratia. Other relatives of Dushan or noblemen established themselves as princes elsewhere. When the Ottomans started their incursions into Europe after 1354, two local lords in Macedonia, the brothers Vukasin and John Uglesa, led the resistance against the Turks and perished in the fateful Battle of Chernomen on the Maritza river in 1371. Soon thereafter Byzantium became a vassal tributary state of the Ottomans. The victory of the Turks in 1371, more than the Battle of Kosovo in 1389, opened up the Balkans for Ottoman conquest.

The empire of Stephan IV Dushan represents the second unsuccessful attempt at the creation of a Graeco-Slavic empire modelled on Byzantium after the one led by king Symeon of Bulgaria (893–927). Like Symeon, Dushan lacked the military and economic resources for such a grand endeavour. The long-term effects of Dushan's empire lay elsewhere, particularly in his patronage of the Orthodox Church, which was revitalized in this period by hesychast monasticism. Hesychasm spread rapidly among the southern Slavs and strengthened the bonds of the Graeco-Slavic cultural commonwealth just before the Turkish conquest of the Balkans. The expansion of the Serbs in the mid-14th century had serious political effects on the Greek peninsula. The breakdown of Dushan's empire left northern and central Greece in a state of extreme political fragmentation and decentralization, a circumstance that eased the Ottoman conquest of this area in the late 14th and the 15th centuries.

Stoicism

Stoicism was a philosophical movement that took its name from the Stoa Poikile, or Painted Porch, in the Agora at Athens, the central public place where philosophers used to meet, to lecture, and to engage in discussions. The school was founded by Zeno of Citium (335–263 BC), who came to Athens around 313 BC and studied under the Academic Polemo and the Cynic Crates. He was succeeded as the head of the school by Cleanthes of Assos (331–232 BC), who in turn was succeeded by Chrysippus of Soli (*c.*280–207 BC), perhaps the greatest Stoic philosopher, Diogenes of Babylon (*c.*240–152 BC), and Antipater of Tarsus (2nd century BC). Zeno divided philosophy into three parts: logic, physics, and ethics. His followers took up and developed his doctrines in different directions. Zeno's student Aristo of Chios stressed ethics to the exclusion of physics and logic, whereas Herillus emphasized knowledge at the expense of moral action. Cleanthes, on the other hand, advocated a religious view of the world, and his contributions to Stoicism lay especially in the areas of theology and cosmology. It was Chrysippus more than anyone else who advanced and systematized the doctrines of the school; thus his works came to be regarded as offering the standard formulation of Stoicism. The so-called Middle Stoa attempted to make Stoic doctrine more accessible to a wider audience, and was more hospitable to ideas from other philosophical schools, particularly Plato's and Aristotle's. Panaetius from Rhodes (*c.*185–109 BC) changed the emphasis of the school's teaching to make it more directly relevant to the practical concerns of everyday life. Panaetius' pupil Posidonius of Apamea (*c.*135–50 BC) also modified the traditional doctrine of the school in some areas, but his main interest seems to have been the sciences, including geography and ethnography. Of the writings of the Stoics down to Posidonius almost nothing remains except for a hymn by Cleanthes and a few papyrus fragments. We have, though, numerous reports in later writers, some of them clearly hostile to Stoic philosophy, and many simply failing to grasp fully the Stoic doctrines. Thus reconstructing the philosophical ideas of the earlier Stoics proves to be a difficult, if not at times impossible, scholarly task.

Stoic philosophy was a major influence on political and moral thought in the Roman empire in the last century BC and the first two centuries AD. The treatises and letters of Seneca (*c.*4 BC–AD 65), the lectures of Epictetus (*c.*AD 55–135), and the meditations of the emperor Marcus Aurelius (AD 121–80) laid particular emphasis on the ethical teachings of the school. Seneca and Roman expositors of Stoic philosophy such as Cicero facilitated the transmission of diffuse accounts of Stoic ethics into the writings of the Latin Fathers, such as Lactantius, Ambrose, Augustine, and Martin of Braga, and subsequently into the medieval world. We find a kind of medieval Stoicism, represented by such scholars as Petrarch, and focused mainly on ethics. During Humanism the main sources for ancient Stoicism were all translated into Latin, and in the 15th century scholars such as Justus Lipsius made an attempt to reconstruct and to some extent revive Stoicism, presenting it as compatible with Christian theology. Early modern thinkers of the 16th century such as Jean Pena, Tycho Brahe, Juan Luis Vives, and Guillaume du Vair already show the influence of Stoic ideas. Some of the most important philosophers of the 17th and 18th centuries such as Hobbes, Descartes, and Spinoza incorporated into their philosophy Stoic elements, just as scientists such as Newton also drew on Stoic ideas.

Although it may be true that especially in the later phases of Stoicism ethics became the vital concern, this does not mean that the other parts of philosophy, namely logic and physics, had a subordinate place in Stoic doctrine. On the contrary, the Stoics viewed philosophy as a whole and repeatedly emphasized the close interdependence of the three parts of philosophical discourse. For though the highest aim of the Stoic was to learn how to conduct himself in life, Stoic philosophers never doubted that this was to be based on a firm grasp of the truth and on an adequate understanding of the world. This is the reason why they used to compare parts of philosophy to the parts of an egg or an animal; the shell or the bones are logic, the white or the flesh are ethics, while the yolk or the soul are physics. The tripartite division of Stoic philosophy as well as the different orders that were suggested for the study of the three parts served only as the most appropriate way of expounding or learning the theorems of Stoic philosophy.

Logic, according to the Stoics, was the study of everything to do with rational discourse. It was divided into dialectic and rhetoric; dialectic included logic in the modern sense, but also grammar, semantics, philosophy of language, and epistemology. The Stoics believed that knowledge ultimately is based on sense experience. Human beings start as irrational animals with no mind at birth, and it is only because they receive repeated impressions from the outside world that give rise to concepts that their rationality grows, by the continuous formation of concepts and beliefs. They also claimed that in principle it is possible for human beings to have solid knowledge. For there are certain impressions, the so-called cognitive impressions (*kataleptikai phantasiai*), which by their nature indicate in a clear and distinct way a fact about the world. Hence they can be regarded as criteria of truth, i.e. as instruments for judging whether our opinions are true or false. Needless to say, the ancient sceptics questioned whether there

are such criteria on which the whole of our knowledge may securely rest, and the Stoics, who engaged in a continuous controversy with them, tried to refine and develop their theory in order to meet their objections.

The basis of Stoic logic is a theory about significant speech, in which the Stoics distinguish between the sound uttered, that which is said or meant, the *lekton*, and the external referent. Although this Stoic doctrine is often highly praised, because it seems to resemble recent theories of meaning and, in particular, to anticipate the modern distinction between sense and reference, there are significant differences. For instance, in Stoic logic a *lekton* does not correspond to any expression, say a noun, but only to a complete utterance. So some *lekta* may be questions or commands, whereas others are propositions that may be true or false. The Stoic logical system was concerned with the interrelations of non-simple propositions, in particular of propositions of the form of conditionals, exclusive disjunctions, and negated conjunctions. It was mainly Chrysippus who, also under the influence of Diodorus Cronus and Philo of Megara, advanced the logic of propositions to its highest point in antiquity, presumably independently of Aristotle's logic of terms. According to Chrysippus, this logic can be construed as an axiomatic system in which all arguments are reducible to five basic kinds of indemonstrable arguments (*anapodeiktoi*) whose validity does not admit of proof. The form of the first two indemonstrables, for instance, was as follows: (1) if the first, then the second; but the first; therefore the second; and (2) if the first, then the second; but not the second; therefore not the first. These two indemonstrables became known later in antiquity and in the Middle Ages as the *modus ponendo ponens* and the *modus tollendo tollens* respectively.

Stoic physics was based on the presupposition that there is one world (*kosmos*) which constitutes a single living being, and that there are only two principles from which everything is constituted; an active principle, which is named God, *Logos* (Intellect), or Nature, and a passive principle, which is understood as unqualified substance or matter. The Stoics stressed that these principles are always joined and never exist separated from one another. The active principle is present in the whole universe and gives to every part of it its character. It is therefore the ruling principle of the whole world, a ruling principle itself of the form of a rational living being that is both intelligent and intelligible. Materiality, on the other hand, is not equivalent to corporeality, but just one aspect of it, as any body is already formed. The world is a continuous object and it cannot be divided into discrete particles, as in Epicurus' physics. The Stoics confined existence to bodies, and vehemently rejected claims of earlier thinkers concerning incorporeal entities. Even God was identified with a special form of fire, which gives shape and life to the world. Following Heraclitus, the Stoics claimed that the transformations of fire, which correspond to the designing or creative activities of God, bring about the alternating phases of a cosmic cycle. For the Stoics did not maintain that the present world is ungenerated and indestructible; they rather believed that it will end in a total conflagration (*ekpyrosis*), but will then be reconstituted again as the conflagration subsides. Only God persists through the conflagration as the fire into which everything is absorbed. As the world order again emerges from this fire, God's presence in earthly things is in the form of breath or spirit (*pneuma*), a fiery form of air. Organic and inorganic things alike owe their identity and their properties to it; its two constituents, fire and air, are blended in different proportions in different things. In the case of human beings, it is the human soul that constitutes part of the all-pervasive *pneuma*. Thus within the world order *pneuma* has two related functions: it gives internal coherence to individual bodies, and it also, because it permeates everything, makes the world as a whole a single coherent body.

In this rational world order, which is ruled by God or *Logos*, the interactions of bodies occur according to exceptionless laws; these laws constitute "fate" and are identified by the Stoics with providence. They held the view that for everything that happens there are causes such that, given these causes, nothing else could happen; for the Stoics "chance" is simply a name for undiscovered causes. That is why they claimed that all future events in principle are predictable, and that astrology and divination should be regarded as empirical disciplines. However, in this deterministic world there still is a place for what is just possible and not necessary. Chrysippus understood the possible as that which admits of being true and is not prevented from being the case. He moreover developed a complex theory of causation to explain how human action is free in a sense required if human beings are to be responsible for their actions. According to his view, fate is the set of external causes that act upon the individual and work to bring about their destined effects; but these external causes only trigger things to happen, whereas the primary cause is in the individual itself. Thus the external antecedent cause by itself does not necessitate the action. Now, although for the Stoics all people are responsible for their actions, only the wise man is free; for freedom consists of acting of one's own choice as one is providentially ordained to act for the best of the universe as a whole. Thus Stoicism is not a fatalistic philosophy of inaction, and the wise man will act in whatever way seems appropriate given the understanding he has; to decide to act in the way one is destined to act is in our own power, even if it is settled by fate how we are going to act, given the sort of person we are.

Stoic ethics presents the most demanding account of virtue in antiquity. Virtue alone is the good, while all wrong actions are equally wrong. We acquire the notion of the good as a crucial part of our reason, and this transforms our motivation in such a way as to be attracted by what we judge to be good. Virtue is sufficient for happiness, which is defined as life in accordance with nature; the nature with which one is to live in agreement is both one's own rational constitution as a person, human nature, and the rationality of universal Nature or God. That we are meant to live in agreement with Nature is also expressed by the Stoics in talking about the common law, or a natural law, which demands that we do what is natural and refrain from doing what is against Nature. This gave rise to a theory of natural law that was taken up by the Christian Fathers, notably Augustine, and exerted considerable influence on discussions of human rights throughout modern times. For the Stoics the possible conflict between particular and universal Nature is only apparent; the virtuous man will have no preference of his own in conflict with the good of the world. Passions are the source of unhappiness, for a person in such a

state, by assenting to a certain kind of false impression, has himself generated an excessive impulse to pursue or avoid something that in reality is indifferent. Passions as false judgements are thus not a feature of non-rational animals, but characterize only human beings who should be blamed for them. So there is no conflict between reason and desire in an individual soul free of passion, and apparent conflicts are explained as rapid waverings of our judgement.

Happiness does not in the least depend on the possession or absence of things only conventionally regarded as good or bad, such as health, reputation, wealth, beauty, etc.; these things are regarded as "indifferent", since they make no difference to virtue and true happiness. Now among things indifferent some things are in accordance with nature and others contrary to nature; both lack goodness, but the first should be selected on the grounds of their natural preferability, and that is why they are called "preferred indifferents". Furthermore, "proper actions" are all the actions that are natural to a mature human being. "Right actions" are a special kind of proper actions, the perfect proper actions, which are the peculiar province of the unfailingly wise or virtuous man. The difference lies in the motivation. A right action is a proper action done with the motivation only a wise man can have. A wise person realizes that the important thing is not to attain a particular preferred indifferent but to try to do so, because it is good to do it. For the Stoics there is a sharp distinction between the virtuous or wise person and everybody else, who is regarded as foolish. It is very difficult to be wise, and that is why the Stoics never claimed that they had achieved wisdom.

Strabo *c.*64 BC–*c.*AD 19

Geographer, philosopher, and historian

Strabo is the author of two monumental works: a universal history in 47 books, which has not survived, and his famous *Geography* in 17 books, which has. As a young man Strabo studied philosophy and was particularly drawn to Stoicism. He knew, and was apparently influenced by, the famous philosopher Posidonius. Strabo believed, with the Pythagoreans, that the universe was geocentric, and that the earth was a sphere with a single land mass surrounded by water. He travelled to Italy three times, visited Greece and Asia Minor, and lived in Egypt for about six years. This combination of travel and philosophical study resulted in a work of geography which is noteworthy for the exposition of a philosophy of geography and for its wealth of historical and mythological information.

Strabo held that the study of geography belongs to the realm of philosophy. He states in book 1 of his *Geography* that, although it is primarily useful to commanders and statesmen, geography is also invaluable for philosophers who investigate everything on land and sea. The study of geography presupposes "the man who busies himself with the investigation of the art of life, that is of happiness" (1. 1. 1). Given this purpose, Strabo's methodology was to interlace clear and accurate descriptions of geographical features with a broad range of cultural information. He saw himself as writing in a tradition of literary, historical geography whose origins went back to Homer, and included Hecataeus and Herodotus.

The value of Strabo's work also lies in the fact that it fills certain gaps in our knowledge of his predecessors. He opens his *Geography* with a history of geographical writing from Homer down to his own day, providing critiques of earlier geographers such as Eratosthenes, Eudoxus, Artemidorus, and Hipparchus. The first two books thus provide us with an invaluable survey of ancient geographical practice, including, among other things, details about ancient mapmaking practices and attempts by Aristotle and Eratosthenes to measure the earth.

In the remainder of the work Strabo describes particular regions. He begins with Europe and works his way east to Asia, ending with north Africa. Within that range he discusses Spain (book 3); Gaul, Britain, and the Alps (book 4); northern Italy (book 5); southern Italy and Sicily (book 6); northern, eastern, and central Europe (book 7); Macedonia and Greece (book 8); Athens, Boeotia, and Thessaly (book 9); and Aetolia, Crete, and certain Greek islands (book 10). His coverage of Asia Minor is divided into four books: Caucasus and Armenia (book 11); Galatia, Bithynia, and Lycia (book 12); the Troad, including the island of Lesbos (book 13); and Ionia, Caria, Samos, Chios, Rhodes, and Cyprus (book 14). The remaining three books describe India and Parthia (book 15); Assyria, Babylonia, Mesopotamia, Syria, Phoenicia, Palestine, and Arabia (book 16); and finally Egypt, Ethiopia, and Libya (book 17).

The books which deal with Greece contain more mythological and historical information than any others. The section on Olympia (8. 3. 30), for example, has as much discussion of Homer as it does of geography. With regard to his reliability, there are times when it is clear that Strabo has visited the loca-

tions under consideration. He describes the coast of Attica in such a way that it seems likely that he circumnavigated it. At other times he seems to have relied largely on other sources. The passages on Boeotia are apparently taken largely from earlier writings, most notably the catalogue of the ships in book 2 of the *Iliad*. Most scholars would agree that Strabo probably never visited the interior of Attica, and perhaps that is true for the rest of mainland Greece as well.

We have no way of knowing whether Strabo's work ever fulfilled its task of aiding some ancient general or politician. We do know that the geography did not find a wide audience in antiquity. Strabo's work was apparently not known to the Romans, not even to Pliny the elder, although the Jewish historian Josephus referred to it. His work was apparently not much used in the Byzantine and medieval periods, but the first translation of his text into Latin (1472) preceded Columbus's voyages by only 20 years. For the next 400 years Strabo's work was in the public eye. As an exemplar of idiographic, or descriptive, geography he was much admired. A prominent German geographer of the 16th century, Sebastian Munster, was referred to as the German Strabo. His *Cosmographia Universalis* was a standard work for over a century. By the mid-19th century such universal geography had become impossible for one man to compile. The trend was toward specialization, and from that point on, Strabo was forgotten as more modern methods of geographical research evolved.

For all that, Strabo's approach to geography is remarkably modern, a suitable predecessor to the current integration of physical and cultural geography. His prose does not, perhaps, reach the heights of literary achievement, but it is serviceable and he does not claim to be writing a literary masterpiece. A. Lesky's harsh judgement (*History of Greek Literature*, London, 1966, p. 890), that Strabo is "not important in any way", is surely unmerited. The value of his work as a compendium of cultural information, a historical geography, and a philosophy of geography is inestimable.

Biography

Born at Amaseia in Pontus *c.*64 BC, Strabo was a pupil of Aristodemus of Nysa and later studied philosophy at Rome. He knew the philosopher Posidonius from whom he may have developed the idea of writing a historical geography. He wrote two major works: a universal history in 47 books (lost) and a *Geography* in 17 books which survives. He died *c.*AD 19.

Sublime Porte

Ottoman centre of government, 1789–1922

The term "Sublime Porte" is a western description of the Ottoman centre of government from 1789 to 1922. Sublime Porte is an English adoption of the French phrase "La Sublime Porte", derived from the Turkish expression "Bab-I Ali". The literal translation of both phrases is "High" or "Exalted Gateway", representing the elevated western opinion of the Ottoman capital. Central to the effective administration of the Ottoman empire was the efficient bureaucracy that directed the actions of government at every level. An imported system imitating the Byzantine model, the Ottoman government of the late 18th, 19th, and early 20th centuries was one of the most effective administrations in the world.

Denoting the centre of government through description of a physical term is a western tradition similar to that of identifying the king's "court" with the centre of government of a kingdom. The Porte, or actual governmental headquarters of the Ottoman empire, changed location over the period 1789–1922, but the term consistently referred to the building or collection of buildings that housed the principal administrative agencies of the empire. In the 18th century the Porte referred to the actual court of the Grand Vizier; however, by the 20th century the term included the Grand Vizier's household and the multiple dispersed bureaux attached to him.

A lasting legacy that permeated many forms of government in the post-Byzantine world was dependence upon a trained, efficient bureaucracy to regulate and administer empires. The organization of the Porte, and the personnel assigned to it, was distinguished by the education of its workers and their dedication to specific government functions. Bureaucrats were selected by their aptitude for specific duties. Scribes dedicated themselves to the routine and monotonous functions of government record. Derived from this condition was a lack of concern for events beyond those related to the completion of official business. The Hellenic tradition, forming the base of the Ottoman administration, demanded servitude to government needs and duties with a lack of regard to social or soci-

etal disposition. This tradition further demanded a highly skilled and dedicated workforce.

Ottoman bureaucratic efficiency remained constant through the period of significant government change that occurred between 1789 and 1922. In the 18th century patrimonial appointment regulated duty assignments within the government and the Turkish system reflected lingering trends of the Hellenic tradition. Ottoman rulers, faced with the daunting task of administering distant and diverse populations, employed Greek civil servants in an attempt to replicate the efficiency of the Greek model. Greek bureaucrats, likewise, found employment within administrations in Europe and the Middle East. Imperial administration required specialized skills and disciplined dedication to duties, two qualities found in Greek civil servants.

It was not until the 19th century that the Sublime Porte reached its peak of efficiency. Imbued with the ideals of government servitude and possessing a great literary tradition, the Ottoman bureaucracy began a slow but distinct rise to prominence within the Ottoman empire. Most scribes dedicated themselves to a life presenting few opportunities for advancement; however, some civil servants found themselves employed in the highest positions in the state. Bureaucratic personnel in the 19th century came, in large part, from the ruling class. Gradually, Greek professionals lost opportunities to more politically attuned Turkish bureaucrats. Turkish civil servants encouraged a series of changes that resulted in the ability to enforce government policy, a condition absent in the period of Greek domination. No longer were the qualities of servitude and dedication in demand, as the Sublime Porte of the 19th century strove to align itself with changes in society and politics.

The Ottomans created a well-regulated bureaucratic apparatus capable of administering the empire with great efficiency through periods of significant political change. Disregarding political concerns, the civil service as an institution possessed the flexibility to meet the evolving needs of a changing nation. The personnel policy of the 20th century replaced the paternalism of the imperial system. This change facilitated a gradual shift in the balance of power from the government heads to the government as a whole. No longer were the imperialist tendencies of irrational and immediate changes in policy possible. The well-established bureaucracy of the 20th century efficiently carried out policy and administered law and order in a manner that was consistent with tradition but flexible enough to survive contemporary demands. The Sublime Porte represented the continuity of a Greek legacy adapted to the needs of a foreign government and system.

SCOTT BLANCHETTE

Summary

The Sublime Porte (literally the High Gateway) is a western term for the Ottoman centre of government in Constantinople from 1789 to 1922. Its bureaucracy (a system inherited from the Byzantines) formed the heart of the Ottoman administration and managed the empire with great efficiency. Its location changed several times.

Superstition

Superstition, taken to refer to a mechanical application of ritual without regard for or knowledge of either the outcome or the reasons underlying the act, can be said to exist in one form or another in every culture and society. In this sense the term is derisive and negative. For that reason one would be hard pressed to find any person or group of persons who jealously claimed that they were superstitious or that their beliefs amounted to superstition. Nevertheless, the word does have a certain currency in discussions of religion and magic. Modern scholarship has yet to purge it of its purely negative connotations or to arrive at any adequate definition of it.

The Greek term for superstition is *deisidaimonia* which roughly means "fear of the divine". The adjectival form of the word, *deisidaimon*, entered the language in the early part of the 4th century BC and bears a neutral, if not positive, meaning. Thus in the *Cyropaedia* Xenophon uses it to designate the piety of Cyrus' soldiers. Writing a few decades after Xenophon, Aristotle in the *Politics* also uses the word in a positive sense, saying that a populace takes comfort in a leader who is pious.

Deisidaimonia is far more commonly used in a derogatory sense, and the ancients commonly supposed that women were especially susceptible to it. The most famous discussion of *deisidaimonia* occurs in the *Characters*, a short tract by Aristotle's student and successor Theophrastus, whose purpose was to present the reader with a catalogue of various personality types. Among those enumerated is the type that suffers from *deisidaimonia* or superstition, which, in his words, is a form of cowardice with respect to the divine. People of this type are mechanical and fastidious in their observance of ritual. They live in a state of anxiety and are for ever concerned with the proper observance of rituals no matter how trifling or strange. To cite one example, "upon seeing a crazy person or an epileptic, with a shudder he spits into his bosom."

Writing some 400 years later, Plutarch informs us in an essay devoted to table talk that belief in the evil eye was a superstition that could be ridiculed by the educated classes of his day. In a separate tract *On Superstition* he discusses more fully the meaning of *deisidaimonia*. In his view, it is akin to atheism, the latter resulting from the former, but not vice versa. Furthermore, *deisidaimonia* arises from false reasoning and is characterized by an almost pathological fear of the divine.

Accordingly, a fundamental tenet of *deisidaimonia* is a belief that the gods are evil and visit misfortune upon man, whereas the atheist attributes such misfortunes to chance.

For Christian writers *deisidaimonia* was a convenient term with which to attack traditional pagan belief. In this way Clement of Alexandria, writing his *Exhortation to the Greeks* during the last half of the 2nd century AD, labels non-Christian belief *deisidaimonia* and calls its believers superstitious. In this work, *deisidaimonia* has a sense of demon worship characterized by festivals and sacrifice. While exceptional, it is worth noting that the author of Acts depicts Paul applying this word to the Athenians in the positive sense of "godfearing". Despite this, the general trend throughout antiquity for Christian and pagan alike was to view *deisdaimonia* as negative. In more modern times it is worth noting that the *Didaskalia Patriki* from the 18th century equates superstition with a belief that Christianity depends upon its Churches for survival. Here the emphasis on symbol over faith appears to be the distinguishing mark of superstition.

The modern belief in the evil eye is an oft-cited example of superstition, although this concept is obviously of very ancient origin and not unique to Greece. As manifested in Greek culture, the evil eye is a complex idea that misfortune can accrue to an individual, animal, or object through the mere glance of one who possesses it. Thus, the evil eye entails not only the idea that someone falls victim to it, but also that someone may acquire it as an attribute. The number of qualities that cause an individual to become vulnerable to it are many and at times contradictory. The belief that the beautiful and ugly alike can fall prey to the evil eye is one example of this. Curiously, mothers who have recently given birth, but have not yet been purified, can suffer its effects, while their babies are immune until after their baptism. A variety of defences are available to protect oneself from the evil eye, the most widely used of which is the protective amulet. Once afflicted by it, the victim may seek treatment from spiritual healers, whether in the form of "wise women" or even the clergy.

Syllabary, Cypriot

The syllabic writing system used on Cyprus from the Bronze Age to the Hellenistic period

It is more precise to speak of "Cypriot syllabaries" than "the Cypriot syllabary", for there have been discovered many forms of syllabic scripts on Cyprus, corresponding to at least two distinct languages (probably more), and dating from the 16th to the 3rd centuries BC.

The earliest syllabic script on Cyprus, the vehicle of a language commonly called "Cypro-Minoan", remains undeciphered. This script has been found on objects dating from the 16th to the 12th centuries BC, including clay tablets, vases, cylinders, and balls, various objects of bronze, copper, and silver, and cylinder seals. The script generally runs from left to right, though a few short inscriptions run from right to left, and at least one is written in boustrophedon fashion ("as the ox plows", running alternately right to left and left to right). At least 85 distinct signs have been identified, each probably representing a complete syllable – i.e. a vowel sound or a consonant–vowel combination, but not an unvocalized consonant (as in a true alphabet). The subject matter of the Cypro-Minoan inscriptions is obscure, of course, since the script is undeciphered, but the inscriptions appear to serve practical purposes: personal names to identify ownership, records of economic transactions, and lists of names and objects. Even in the present state of ignorance about the language underlying these inscriptions, the fact of there being so many inscriptions on such a variety of objects, all distributed over a wide area, conveys the idea of a general population on Cyprus that had achieved at least a limited degree of literacy by this early period.

The Cypro-Minoan script and the Linear B syllabic script of the Greek mainland stand in equal relation to the Linear A syllabic script of Crete, both Cypro-Minoan and Linear B being offshoots of the even more ancient Linear A. The relationship between these three syllabic scripts was not understood at first, but it is now generally accepted that even the earliest Cypro-Minoan inscription, a small fragment of a clay tablet from Enkomi (on the east coast of Cyprus) containing three lines of text with 20 distinct signs and dated to the late 16th century, is derived directly from Minoan Linear A. Perhaps as many as 18 of the 20 distinct signs on the Enkomi tablet have parallels in Linear A, while none of the 20 signs has been found in any Near Eastern script. This confirms what had been well known from other archaeological evidence: that Cyprus during this period was within the orbit of Minoan Crete. It implies further that epigraphic contact between Crete and Cyprus may date as far back as the late 17th century BC. As this is well before the arrival of Greek-speaking Mycenaeans on Cyprus, the source of the early Cypro-Minoan script can now be confidently ascribed directly to Minoan Linear A, without the intermediation of Mycenaean Linear B.

The script of the Enkomi tablet is the prototype of the three subcategories of Bronze Age Cypro-Minoan (CM) script, which have been classified by type of text, location of find, and writing style: CM 1 (the local script from all over Cyprus), CM 2 (from Enkomi), and CM 3 (from the region of Ugarit in Syria). As such, it is also the ancestor of the second major cate-

Cypriot Syllabary: inscription found on a bronze obelos (spit) in a tomb at Skales, Cyprus

gory of syllabaries on Cyprus: the later Archaic and Classical Cypriot syllabary.

While the Archaic and Classical Cypriot syllabary is epigraphically the natural evolution of the Cypro-Minoan, the language conveyed by the Cypriot syllabary has been understood for over 100 years, its decipherment having been initiated by George Smith in 1871. The language is Greek. Mycenaean Greek traders had begun to focus their attention on Cyprus from as early as the late 15th century BC, and trade between the two countries – as evidenced by the vast quantity of Mycenaean pottery that continues to be found on Cyprus, as well as by the juxtaposition of Mycenaean and Cyprian goods recently discovered in the underwater excavation of a Bronze Age trading vessel wrecked off the coast of Ulu Burun – grew enormously in the 14th and 13th centuries BC. Finally, in the wake of the disturbances that inundated the Mediterranean at the end of the 13th century BC, large numbers of Mycenaean Greeks, displaced from their palace states on the Greek mainland, fled both westward and eastward, one of the more attractive destinations being Cyprus.

These Mycenaean refugees brought with them their language – a dialect of Greek now designated Arcado-Cypriot – which they began to transcribe in the writing system already in place on Cyprus. Like the Linear B syllabary on the Greek mainland, the Cypriot syllabary served this purpose adequately; and the fact that some of the later Cypriot signs – *na*, *se*, *pa*, *po*, *to*, *ti*, *ta/da*, and *lo/ro* – are nearly identical to Linear B signs of the same value shows that some crossfertilization occurred. The Cypriot syllabary has the same five vowel sounds as Linear B, and the consonant sounds are only slightly different (the labio-velars are absent; *t* and *d* are not distinguished, while *l* and *r* are). But unlike Linear B, the final consonants *-n*, *-r*, and *-s* are noted, and consonant clusters and diphthongs are fully spelled out. The ideograms that are so common on the Linear B tablets are absent in the Cypriot inscriptions, and, unlike Linear B, the writing direction of the Cypriot script is usually from right to left, perhaps owing to Semitic influence. The system as a whole is somewhat more streamlined, with only 56 distinct signs in the Cypriot script in comparison to the 87 distinct signs of Linear B.

The earliest inscription in the Cypriot syllabary, found in Palaipaphos in southwestern Cyprus and dating from the 11th century BC, is on a bronze spit; it contains five signs – *o-pe-le-ta-u* – which can be recognized as the genitive case of a Greek name, presumably that of the owner of the spit. The next earliest extant inscription does not occur until the 8th century BC, and inscriptions do not become common until the 6th. These are mostly funerary and dedicatory inscriptions on stone, metal, and clay. A very long inscription dating from 480–470 BC, containing more than 1000 signs, has been found in the city of Idalium, in central Cyprus. It is a large bronze tablet engraved with a promise from the king of Idalium to grant plots of land as a reward to a family of physicians who had operated without pay on those wounded in battle during a siege of the city by the Medes. The corpus of Cypriot inscriptions continues to grow as excavations on Cyprus continue, and it can now boast around 1000 members.

It is a matter of some surprise that although the Greek alphabet, modelled on the Phoenician, was apparently current on Cyprus from the 8th century BC on, the syllabic system continued to be preferred until at least the Classical age. But eventually inscriptions began to be written digraphically, with the Cypriot syllabary and the Greek alphabet written side by side, until the spread of Hellenization under Alexander the Great tipped the scales in favour of the alphabetic system.

As an addendum, it should be noted that several inscriptions in the Classical Cypriot syllabary, some as late as the 4th century BC, found especially in the city of Amathus on the south coast of Cyprus, cannot be deciphered as Greek. This unknown, non-Greek, perhaps native language is conventionally called Eteo-Cypriot. Its relation to the undeciphered Cypro-Minoan of the Bronze Age remains obscure.

Symeon of Thessalonica, St d. 1429

Archbishop and liturgist

Until quite recently, Symeon has been known to scholars and the Orthodox faithful mainly as the author of seven works of pastoral and liturgical theology printed in volume 155 of Migne's *Patrologia Graeca*. These texts, which were first published in 1683 by patriarch Dositheos of Jerusalem and later translated into the vernacular languages of Orthodox Christians, have earned Symeon both recognition as a great authority on Byzantine worship and notoriety for his strong anti-Latin bias. Yet very little was known about either his life or his activities as archbishop of Thessalonica during a particularly turbulent period of that city's history until a substantial body of previously unknown historical, dogmatic, and liturgical writings by Symeon came to light in the last third of the 20th century. In addition to providing a biographical context for the archbishop's previously known work as a theologian and mystagogue, these recently discovered texts also contain valuable information about such events in the history of Thessalonica as the long siege of Murad II and Byzantium's transfer of the city to Venetian rule.

Symeon's spiritual formation apparently began in the last quarter of the 14th century within the circles of hesychast monks who, ever since the vindication of Gregory Palamas, had controlled the patriarchate of his native Constantinople. Tonsured as a monk and later ordained to the priesthood, he preached publicly in the capital and wrote a short treatise *On the Priesthood*. While gaining a reputation for erudition, Symeon evidently became acquainted with high officials of the Byzantine court and Church. Although the exact nature of these contacts is unknown (Balfour suggests that he may even have served as the confessor of Manuel II Palaiologos), they doubtless contributed to his elevation to the archiepiscopal see of Thessalonica sometime between June 1416 and April 1417.

As the archbishop of Byzantium's second city, Symeon immediately sought to put into practice the strong and simple faith in God, Orthodoxy, and empire that he had acquired as a monk in his beloved Constantinople through bold initiatives to raise moral and liturgical standards within his archdiocese. After issuing as his first official act an encyclical urging his entire flock to repent, he began to combat what he saw as moral laxity through a combination of preaching repentance and judicial activism. This course of action, which he pursued vigorously despite being beset by frequent and severe illnesses, soon alienated many members of his flock. Opposition to the rigorous application of the law in the ecclesiastical and civil courts under Symeon's jurisdiction was particularly strong, leading to successful appeals against his harsher decisions on matrimonial impediments to the patriarchal synod. Somewhat less controversial were his efforts to improve worship at his cathedral of Hagia Sophia, which was the last church in the empire to celebrate daily the liturgy of the hours according to the archaic Constantinopolitan "Sung" Office (*asmatiki akolouthia*). Recognizing the desire of worshippers to hear popular hymns from the monastic offices of Mar Saba, Symeon introduced a reformed cathedral Typikon and prayerbook that systematized borrowings of texts and music from the dominant Palestinian monastic rite. These two service books – which have survived incompletely as MSS. 2047 and 2065 in the National Library, Athens – show that Symeon further enriched the liturgy of his cathedral by supplementing the pre-existing liturgical texts of both rites with a considerable number of hymns and prayers of his own composition.

Political events overshadowed Symeon's work as the chief liturgist and moral guardian of Thessalonica when the peace that had held since the city's first Turkish occupation in 1403 began to deteriorate. In opposition to strong civic factions that favoured either a transfer of sovereignty to Venice or outright surrender to the Turks, Symeon preached a policy of total loyalty to Constantinople and Orthodoxy backed up by repentance and faith in the miraculous powers of the city's patron St Demetrius. Already deeply unpopular, this idealistic stand provoked severe criticism that caused the near total breakdown of his health, despite which he embarked on an abortive personal mission to the capital in 1422. After reaching only as far as Mount Athos, Symeon returned to Thessalonica and witnessed the despot Andronikos hand over the city to the Venetians in September 1423. Remarkably, with the transfer accomplished, Symeon began to recover from his illnesses and bargained successfully with his new Roman Catholic masters to safeguard the rights of Thessalonica's Orthodox Christians. During the following six years of constant Turkish siege, he regained the respect of his dwindling flock for his efforts to alleviate their material suffering. These contributions to the maintenance of morale greatly impressed the city's Venetian governors, whose Senate recognized him as *fidelissimus noster* for his determined resistance to the Turks. When Symeon died unexpectedly in the autumn of 1429, some months before Murad II's capture of Thessalonica, his death was recorded by the historian John the Reader as presaging the removal of God's protection from the city.

After the fall of Thessalonica, Symeon's personal and literary reputation went into steep decline. The vast majority of his texts for the archaic public liturgy of Thessalonica probably fell out of use immediately, becoming useless after the city's great secular churches were converted into mosques. His dogmatic and hortatory writings, highly topical and full of temporarily unfashionable anti-Latin sentiments, similarly passed into obscurity. By contrast, the seven mystagogical and didactic works mentioned above were extremely influential as textbooks for priests throughout the period of Turkish domination. The greatest of these is the monumental *Dialogue in Christ*, an extended treatise on doctrine and liturgy set as a dialogue between Symeon and an unnamed lower cleric. Beginning with a section refuting various heresies, the *Dialogue* proceeds systematically to describe and interpret the symbolism of the major liturgical services – both cathedral and monastic – of the Orthodox Church, achieving in its course a valedictory synthesis of the two main streams of Byzantine liturgical theology: the "cosmic" tradition of Maximos and the "life of Christ" tradition of Germanos. In recognition of this and his other achievements, Symeon was finally proclaimed a saint of the Orthodox Church on 3 May 1981.

ALEXANDER LINGAS

Biography

Born in Constantinople in the later 14th century and educated by hesychast monks there, Symeon was tonsured as a monk and ordained a priest. He became archbishop of Thessalonica in 1416/17. He witnessed the handover of the city to the Venetians in 1423. His writings concern pastoral and liturgical theology but also the history of Thessalonica in the 1420s. His didactic works were used as textbooks for priests. He died in 1429.

Symeon the Logothete

Chronicler of the 10th century

Symeon the Logothete is the name of a 10th-century chronicler who worked in the revived tradition of Byzantine chronicle writing. The tradition of the world chronicle (that is, spanning the period from Creation to present memory) had stalled in the 7th century, only reviving (or surviving) at the start of the 9th century with the world chronicle of Theophanes, which ended in the year 813. Other 9th-century chronicles are Nikephoros's *Short History*, which covered the period from Phokas (602–10) to Constantine V (741–75), and the *Scriptor Incertus de Leone Armenio* covering up to a few years after 813, but it was George the Monk who next took up the mantle of the world chronicler, covering from creation to 842. After George the next surviving chronicle is that of our Symeon. Unfortunately no edition of the original text exists, and the problematic nature of producing one is not in doubt; it is universally acknowledged that Symeon's chronicle presents severe difficulties, for the primary text was soon the object of redactional alterations that have modified its original character (see for instance Markopoulos, 1979, p. 83).

It is however generally agreed that the chronicle covers world history up to 948, that it shows a positive bias towards the emperor Romanos I Lekapenos (920–44) at the expense of the Macedonian dynasty, and extends an earlier chronicle that originally covered from Adam to 713 (see however Markopoulos, 1983, p. 279). The chronicler's hand seems to appear first in the reign of Michael III (842–67), and from this point on the chronicle appears to fall into three distinct parts: the reign of Michael III, the reigns of Basil I, Leo VI, and Alexander (867–913), and a personal account of the period 913–48 (Jenkins, 1965). For the reign of Michael III, the author has apparently united an account of the accession of Basil the Macedonian, a Basilian résumé, and some interpolations, rather than a single hostile account of the life of Basil (Karlin-Hayter, 1991). As for the middle section, it seems that the author has used an annalistic source, with the result that the order of events for this period is chronologically accurate, in contrast to the chronological errors for the periods 856–67 and 913–48 (Jenkins). Following Jenkins's method for the period 867–913 Treadgold argues that Symeon is also chronologically accurate for 813–45, having used accurate chronicles that are now lost, thus making him a very significant source for early 9th-century history. For the four reigns before Leo V the *Chronographia* of Theophanes is used.

The textual history of the chronicle is not, however, so simple; in fact there appear to be two versions of the chronicle: the deemed-authentic A, which is philo-Lekapene and close to the original text; and B, the long version, with interpolations from Genesios (Markopoulos, 1979; Karlin-Hayter, 1971, pp. 454–55). Logothete B is notable for its favouring of the Phokas family, and is extended to 963. There also appears to be a linguistic difference between the two versions. B is more "purist", with methods akin to those of the Metaphrast, but may have been written by the Logothete too, using a pro-Phokas text (Markopoulos, 1979, p. 89).

As noted above, the original text was soon subject to redactions by other authors, notably those of Theodosios Melissenos (once thought to be "Melitenos") and Leo Grammatikos. It is also known as the continuation of the chronicle of George the Monk (Georgius Monachus Continuatus), perhaps done by Symeon the Logothete himself (Moravcsik, 1958, p. 270). There is also another version of Georgius Monachus Continuatus (marked by insertions from Genesios), so there are in fact two redactions under this name also. Thus developed the different redactions of the "Epitome" (the name given to the hypothesized original base text), which appeared under diverse author names or anonymously.

It is interesting to note the different bias of the two other mid-10th-century chroniclers, Theophanes Continuatus (whose chronicle consists of the sections 813–67, the *Life of Basil*, and the later extension from 886 to 961) and Genesios (who spans the years 813–86), who are essentially pro-Macedonian (though all the chroniclers show the preference for the arrangement by reign rather than by year). These two chroniclers continued Theophanes directly, from 813. While Theophanes Continuatus is distinct from Symeon up to the famous book 5, the *Life of Basil*, he does turn to Symeon (via the second recension of Georgius Monachus Continuatus) for material for book 6 (886–961), namely the period 886–948. The later chroniclers Skylitzes and Zonaras were to turn directly to Theophanes Continuatus rather than to Symeon the Logothete. Another chronicler worth noting in connection with Symeon the Logothete is pseudo-Symeon, whose chronicle covered from the creation up to 963, and is in fact largely copied from other sources, including Symeon the Logothete. His chronicle is marked by the insertion of regnal years (which

seem to have no validity), and also by a striking anti-Photios streak.

As to the person of the original Symeon magister and logothete, some seek to identify him with other known 10th-century homonyms, notably Symeon Metaphrastes, thus making a single figure who was "a high imperial official, hagiographer, lawyer, legal writer, chronicle compiler – and poet" (Ševčenko, 1969–70, p. 218). However some still doubt this conjecture. Metaphrastes was famous for his systematized collection of saints' lives, which he reworked in a higher literary style. There are also poems (on the deaths of Stephen son of Romanos I and of the emperor Constantine VII) and letters in the name of Symeon magister and logothete.

Symeon The New Theologian, St 949–1022

Mystic

Symeon was a highly controversial figure in his time. His works are among the most vivid of the eastern Christian Church's tradition, with their rhapsodic appeal to direct personal experience. His title "New Theologian" began, in all probability, as a denigration, suggesting an "innovator", but his disciples turned it to their advantage, elevating him to the rarefied heights of only two others who were given that designation – the Apostle John and St Gregory of Nazianzus. He was afterwards to be regarded as a forefather of the hesychast movement, although the influential treatise assigned to his name, concerning the physical method of hesychastic prayer, so highly prized among the Athonites, is not by him; nor can certain noted characteristics of later hesychastic method be found in his work, such as devotion to the Jesus prayer. Nevertheless, his ecstatic light-centred mystical enthusiasm set a standard to which later writers aspired. In a real, but qualified sense he can be regarded as a founder of what later came to be Byzantine hesychasm.

Symeon was born to a wealthy Byzantine family, provincial aristocrats from Asia Minor. His father brought him to Constantinople for his education in 960. In the revolution of 963, as Nikephoros Phokas seized the throne, Symeon's uncle and patron met his end and the child's education was interrupted. After a short setback he reappeared once more in an elevated social setting. An unknown senator had taken him on to his household staff. Symeon attended the palace daily, and soon assumed senatorial rank himself.

In his twenties he described himself as a somewhat rakish youth, travelling to and from court on business. He first encountered the Studite monk Symeon Eulabes at this time, and, like other aristocrats, he was drawn to this odd but generously charismatic figure who served as father confessor to an elite group. He visited him whenever he was in the city, and the monk gave him spiritual books to read, but clearly there was little more to the connection until the occasion, around 969, when he had an experience that he described (much later) as highly significant for him. He tells us of a vision of lights – one light in the presence of another. He interpreted the event as his spiritual father interceding for him before Christ. Nothing much seems to have changed in the outward circumstances of his life subsequent to that first visionary experience, but it would be decisive in retrospect. Seven years after this, in 976, when he was 27 years of age, another palace coup initiated a sequence of events that changed his life permanently. The *parakoimomenos* (guardian of the bedchamber) Basil seized the throne on behalf of the prince (Basil II) and Symeon's family seem to have been clearly marked out by the new power as a hostile element. His political career was definitively terminated at this point, and he seems to have taken temporary refuge with his spiritual father at the Stoudios monastery in Constantinople. Here he tells us that once again he experienced an overwhelming vision of light. He saw the radiance of Christ, directly, and this became for him a definitive conversion point. It marked his permanent entrance into the monastic state.

In a short time Symeon was moved to the St Mamas monastery at the Xylokerkos gate in the capital (not far from

the Stoudios monastery). The hagiographer, and those following him too trustingly (for the *Life* is tendentious and often confused over details), have seen this as an "expulsion". It ought to be read as his promotion and his permanent protection by sympathetic patrons outside the court. Three years later, in 979–80, Symeon was elected *hegoumenos* (abbot) of the same household. It was an event that indicated the significant patronage he could still bring to bear as a powerful aristocratic leader, even though now a monk.

Symeon substantially refurbished the site of St Mamas, and at this time began to deliver the traditional morning Catecheses to the monks of the community, which have survived as the central body of his work. Much of his approach in the Catecheses is traditional Stoudite observance, but he has his own style and emphasis, and so he places a particularly strong emphasis on the dedicated obedience that he expects should be given to the spiritual father by all monks. He stressed the necessity for direct personal experience in the life of the Spirit, underlining the need for tears, even insisting that without tears a monk should not approach the divine mysteries. This telescoping of the roles of spiritual father and *hegoumenos* seems to have caused no little conflict among his subordinates. Between 986 and 989 Byzantine society was disrupted by serious civil dispute. The emperor Basil II took measures to restrict his enemies, and regarded Symeon with more and more suspicion. In the same period (986–87) Symeon Eulabes died at the Stoudios monastery, leaving Symeon as the new head and leader of his school of disciples, a circle that included both monastics and aristocrats.

Some time between 995 and 998 the growing opposition to Symeon's discipline and teaching broke out in the form of a revolt by a large number of his community. They threatened him at morning service and lodged an official complaint against him at the patriarchal court, a plea that was eventually dismissed. The *Life* attempts to minimize the whole affair, but the uprising probably coincided with the death of patriarch Nicholas Chrysoberges and the installation of the first appointment of Basil II in his own right, patriarch Sisinnios II (995–98). Sisinnios was succeeded by Sergios II Manuelites (999–1019) and the latter's court also instituted legal proceedings against Symeon. These processes were more vigorously pursued and eventually would result in his exile. The first formal arraignment turned around the issue of the unofficial cult of the master that Symeon had instituted in memory of his teacher. The elder's reputation was attacked, in an attempt to discredit the younger Symeon, and after 995 his cult (veneration of his icon) was forbidden at St Mamas. The emperor thus began to move against Symeon by means of the ecclesiastical court process, employing his long-time confidant bishop Stephen of Alexina, the patriarchal chancellor. In 1003 an attempt was made to entangle Symeon in a more formal theological debate concerning his Trinitarian orthodoxy. He returned a satisfactory answer to the charges but also took the opportunity to lambaste Stephen for attempting to theologize without first having experienced impassibility and the divine light. It was tantamount to a declaration of war. The attrition carried on for six years in all, culminating in a sentence of deposition issued against Symeon in 1005 with house arrest, then exile.

On 3 January 1009 Symeon was forcibly exiled to Paloukiton, near Chrysopolis. His circle soon supplied the money to buy the oratory of St Marina and nearby lands. Here Symeon wrote some of his most famous works, including the exquisite *Hymns of Divine Love* which are a classic of Byzantine religious writing. They mark him out as one of the Christian tradition's leading mystics. On his last journey, while returning to his monastery, he was worn out by an attack of dysentery, and nearing Chrysopolis he died at the age of 73, in 1022.

Symeon was received as a great master of the inner life by the Athonite monks, and his reputation was championed on the Holy Mountain. In recent decades he has also attracted increasing scholarly attention. His writing is important both for the historical light it throws on a dark period of Byzantine affairs, and more so for the spiritual and mystical themes it treats with such freshness and authority. In a more restricted sense Symeon is also a highly influential figure for the doctrine of spiritual fatherhood that he represented to such a strong degree, and which has had so marked an impact on Orthodox spiritual praxis.

JOHN A. MCGUCKIN

Biography

Born in Paphlagonia in 949, Symeon was brought to Constantinople in 960 by his father for his education. He initally embarked on a career in public life and became a senator. But under the influence of Symeon Eulabes he changed course and entered the Stoudios monastery. He became head of his own monastery in 979, but was exiled in 1009. His writings include catecheses, hymns, and treatises. He died near Chrysopolis in 1022.

Symi

Island in the Dodecanese

The Aegean island of Symi lies to the north of Rhodes, of which the nearest point is 24 km away, and almost equidistantly between the two rocky mainland peninsulas of Cnidus and Dorakis, the latter some 10 km to the south; with an area of 64 sq km it is one of the smaller islands of the Dodecanese.

Symi is mentioned briefly in the writings of Herodotus, Strabo, and Pliny, but it was the 6th-century AD grammarian Stephanus Byzantinus, drawing on Classical authors, who provided most of the early information on the island's origins. Initially called Metapontis and Aegle, the island apparently obtained the name Symi from the daughter of Ialysus, called Syme; it was she, with Chthonius, a son of Poseidon, who was held to have first populated the island. At several points in its history the island was deserted, but was finally (according to Diodorus Siculus, 5. 33) populated by Argives and Lacedaemonians. In the *De Thematibus* of Constantine VII Porphyrogennetos (913–59) the island is listed in the 14th theme, named Cibyrreote. When Christopher Buondelmonti wrote of the island in his *Liber Insularum* of *c.*1420 he claimed that its name derived either from Simatis, who had been king of the island, or from *sima*, the Greek vernacular for "near", in reference to its proximity to Asia Minor.

The island's history is dominated by its involvement with the sea, the Symiots being renowned boat builders, sponge fishers, and swimmers. The prowess of the men at building boats was already acknowledged in Homeric times, since during the Trojan War the hero Nireus, the son of Aglaia and king Charopus, is reported (*Iliad*, 2. 671) to have gone with a contribution of three ships from Symi to assist Agamemnon in the Trojan expedition.

The small harbour-side village of Nimporeio offers interesting traces of early Christian building activity. Mosaics from the floor of the north aisle of a basilica can be seen there; dated to the 6th century, the inventiveness of the designs, which include a man leading a camel and a stag being chased by a hound, suggests a relatively prosperous phase in the island's history. If so, this would probably have been brought to an end with the widespread Arab raids of the 7th century. Symi is not mentioned by any of the medieval Byzantine historians.

The Hospitaller Knights of St John of Jerusalem, based at Rhodes, were certainly in possession of the island by 1351, since in that year the inhabitants complained to the Order that they could not afford to pay the *mortuaria* (a tax comparable to death duties), but it is probable that the knights were already in control by 1320, as was certainly the case on the nearby island of Nisyros. The castle that the knights built at Symi on the ancient acropolis of the harbour town of Egalio made use of pre-existing Cyclopean walling, and it must have played a significant part in their developing defences against the Turks. In 1457, and so only four years after he had taken Constantinople, the young sultan Mehmet II launched an assault on the castle as part of his campaign of intended subjugation of the Aegean, but his forces were driven off by the boiling oil and liquid pitch that the defenders poured down; the attackers withdrew after ten days. The importance that successive grand masters placed on the castle of Symi is shown by the escutcheons that can still be seen there; one is of the grand master Pierre d'Aubusson (1476–1503), and is dated 1507 (four years after his death), suggesting continued rebuilding.

The natural resources of the island, which has a mild climate although only a modest rainfall, included plentiful trees that for centuries were the source of timber for the construction of boats. This supply was much depleted when many ships were being built during the War of Independence. The land is generally rather infertile, but wine was certainly produced there in the later medieval period.

Symi did not play any major strategic role in Hellenic history, being dominated either by the nearby promontories of Asia Minor or by the much larger island of Rhodes to the south. Thus, with the capitulation of the Hospitallers to the Turks in January 1523, Ottoman rule was inaugurated in Symi. The island was to remain in Turkish hands until 1912, when the Italians occupied all the Dodecanese. The 18th-century monastery of St Michael Panormitis on the south coast played a part as a staging post at the end of the World War II, providing shelter for refugees who were returning to Greece

from Asia Minor. Symi returned to being within Greek governance only in 1947.

Summary

One of the Dodecanese, Symi is renowned for its connection with the sea. Boat building has been an important industry since Homeric times. The Hospitaller Knights of St John, based at nearby Rhodes, controlled Symi from *c.*1320 to 1523 when it fell into Ottoman hands. Since then its history has followed that of the rest of the Dodecanese.

Symposium

A *symposion* was a drinking party. It was also the setting from which much of early Greek poetry and philosophy emerged.

The focus of research on symposia is on Greek cities of the 7th to 4th centuries BC: during that period, several forms of evidence concur in demonstrating their crucial importance in Greek culture. They are to be observed in the archaeology of private houses and of temples, in sculpture, in the form and the iconography of vases, and in poetic and prose literature. But if we look for origins, the different kinds of evidence lead us in different directions.

Symposia took place in purpose-built rooms, *andrones* ("men's rooms"), easily recognized by archaeologists because they were designed to take a certain number of couches (usually 5, 7, or 11) around the walls. Sometimes there are surviving floor markings to show the placing of the couches and of the small serving tables. Participants reclined, one or two to a couch. The custom of reclining at banquets and drinking parties is traced to the 7th or 8th century BC in Greece, to the 6th or 7th century BC in Etruscan Italy, and to the 8th century BC or earlier in the Levant and Mesopotamia. The idea thus appears to have spread westwards, and has been linked with Phoenician trading contacts.

Symposia followed an evening meal. Food did not mix with conversation or with cultural pursuits. After eating, a libation of neat wine marked the beginning of the drinking; the libation was mainly for the gods, however. Wine, in large quantities, was then mixed with at least equal volumes of water for the symposium itself. The ideal strength of the mixture was a matter of argument: it was decided on each occasion by the host or by a participant who was chosen as *symposiarchos* ("party ruler"). Mixing was done in a large vase (*krater*). Vase paintings show how attendants ladled wine from the *krater*

Symposium: relief showing a participant holding out his drinking bowl to have it replenished, National Archaeological Museum, Athens

into individual cups. *Krateres*, accompanied by drinking cups, are well known from Classical Greece (and Greek vases were exported in great numbers to Etruria, where they are found as grave goods), but there are also vases of similar forms from much earlier sites in Greece and the southern Balkans, suggesting that the wine-mixing ritual is to be traced back locally to prehistoric times.

Vase paintings depict many other details of the typical or ideal symposium. Sweets, dried fruit, and nuts accompanied the wine. Toasts were drunk, often praising the beauty of boys; some vases appear to have been commissioned as mementos of this. Music was played, both by participants and by slave entertainers such as the ubiquitous "flute-girls" (*auletrides*). Philosophy, politics, and many other topics were discussed; poems and songs were recited. Dancers, acrobats, and prostitutes might be hired. Drunkenness supervened – slowly, since the wine was diluted – but almost inevitably, since not to drink was a cause for mockery and the proceedings might well last all night. Symposia allowed free speech and the release of inhibitions: proverbially, things said and done there were to be forgotten, or at any rate not to be betrayed, the next day.

In Greece the symposium was essentially an activity for those of citizen status, and for men only. The latter was apparently not true of Levantine drinking parties and certainly not of Etruscan ones. In Greece any women who were present were slave entertainers or *hetairai* (courtesan) and in either case sexually available; participants' wives and daughters were not to be seen. The presence of adolescent boys, under the aegis of a parent or a lover, may be regarded as a form of initiation into adult male society.

There was a genre of short poems composed specifically for recitation at symposia, *skolia* or drinking songs. There is persuasive evidence that much of the rest of early Greek poetry, including elegy, iambus, and monodic lyric, was typically performed at symposia too. As a setting for philosophical discussion symposia appear in different, but complementary, lights in the *Symposium* of Plato and the *Symposium* of Xenophon, in both of which Socrates is depicted as a participant. These two works mark the beginning of a literary genre of dialogues with a sympotic setting and, in general, with moral, philosophical, or scholarly themes; examples survive by several much later authors, including Lucian and Plutarch.

While feasting might often be a municipal, and an essentially public, activity, symposia may be seen as essentially private. How far the practice was common to different social classes must have varied from place to place. In the Archaic period, for example, symposia are integral to the aristocratic society depicted in the lyrics of Alcaeus and Anacreon; they are not apparent at all in Homer or Hesiod, though aspects of sympotic behaviour have been observed in the feasts of the *Odyssey* and *Iliad*. In Classical Athens, if we may judge by the written sources, people who went to symposia consisted of a fashionable, cultural, and political elite; others did not know how to behave at such a gathering, or even how to recline elegantly, as Streptocleon teaches his father Bdelycleon to do in an amusing scene from Aristophanes' *Wasps*. Some participants were wealthy enough to act regularly as hosts, while others were perpetual guests or *parasitoi*, tolerated or welcomed for their entertainment value.

It is far from clear how long into Hellenistic or Roman times the symposium remained a living institution. In the 2nd century AD Plutarch's *Symposium Questions* claim to be based on social gatherings that were similar to Classical symposia in their intellectual content if not in their sexual freedom. This is the latest significant source for symposia as a feature of contemporary society.

Synesius AD 370–413

Administrator and philosopher

Synesius, an aristocrat of Cyrene, proud of the city's Doric past, was educated at Alexandria among other places by the philosopher Hypatia, from whom he acquired his deep love of Plato mediated through the writings of the Neoplatonists. Thanks to his letters (156 survive) we have one of the fullest and most sympathetic depictions of the life of a late 4th-century amateur philosopher and administrator. For nearly three years (AD 397–400) he represented his city in Constantinople on an embassy to secure tax concessions. His essays *On Kingship* and *On Providence* reveal this involvement with contemporary politics in the imperial capital. No doubt this practical experience and the high regard in which he was held by his fellow citizens as well as his own virtuous life were among the reasons why Theophilus, the patriarch of Alexandria, asked him to become bishop of Ptolemais (Cyrene and the Pentapolis) even though he was not yet a Christian. In a long and eloquent letter (105) he attempted, clearly in vain, to dissuade the patriarch, arguing his loyal devotion to his wife and family and his deep attachment to the philosophy of Plato. On three issues in particular he felt he could not compromise: the eternity of the world, the resurrection, and the creation of soul at birth. He was willing to accept certain Christian dogmas as "mythical" truth presented to the faithful in general, so long as he might continue to hold his own, true view, in private. This is how he puts it himself:

> It is difficult if not impossible for doctrines to be shaken which have entered the soul through knowledge and

> proof. You know that philosophy in many ways opposes these doctrines that are on everyone's lips. To be sure, I will never think it right to consider the soul to be generated after the body. I will not say that the cosmos and its parts will perish. The resurrection that everyone speaks about I consider to be something sacred and inexpressible and I am far from agreeing with the ideas held by the masses. The philosopher's mind which has a vision of the truth can agree to a necessary lie.

Synesius served as bishop from 410 to 413, a number of his letters giving details of some of the difficulties he faced with corrupt officials and of some of his pastoral duties. His last days were not happy, because he vainly sought to protect Cyrene from the incursions of marauding tribesmen from the interior.

Although a man who enjoyed the active life – he was particularly fond of hunting – his temperament was also deeply spiritual as is testified by nine surviving metrical hymns that are completely pagan in content. They betray the influence of Orphic, Hermetic, and Chaldaean ideas and expressions grafted onto a metaphysical structure that owes much to a tradition taking its rise in speculations begun by Porphyry. Despite their pagan ethos, the personal engagement and passion of the author as he contemplates his place as an exile in the beguiling and dangerous physical world ensured their popularity among Christians. Synesius, however, and here he was again following in the footsteps of Porphyry, rejected in his work *On Dreams* the sacramental (theurgic) rituals of salvation espoused by Iamblichus and Proclus.This tendency he probably owed to Hypatia's version of Neoplatonism that emphasized science more than ritual religion. The treatise *On Dreams* extols personal moral and intellectual effort in the ascent and return of the soul to God.

The figure of the incorruptible and indefatigable bishop caught the imagination of Christian writers of the 6th and 7th centuries such as Evagrius and John Moschos, whereas from the 9th century onwards the philosophical content of his essays is of greater importance to his readers. Photios praises him as having brought glory again to Cyrene. Synesius' own programme to unite literature (rhetoric) and philosophy, expounded in his essay *Dion*, found a resonance in the similar programme of Michael Psellos who, like Synesius, could also regard the study of Plato as the best of all preparations for Christianity. In the 14th century Nikephoras Kallistes cites with approval a large passage of letter 105, included perhaps as a disguised claim for freedom of thought.

Synesius appealed, too, as a model of Attic style and as an example for the genre of epistolography in which he was admired by Theophylact of Ohrid. Although Synesius was one of the most popular authors of the Byzantine period, he can scarcely be described as an original or fundamental thinker; the later wide circulation and influence of his works can best be ascribed to the fact that he lived at a period of transition from a pagan to a Christian world, a transition that he encapsulated in his own life and thought. It was all too tempting to find together in one person Christian bishop, pagan philosopher, Greek stylist, and an engaging and likable character. Too unorthodox to have been proclaimed a saint, he has nevertheless served as a model for the double ideal of traditional Hellenist and devout Christian.

Syracuse

City in Sicily

Syracuse (modern Siracusa) was the leading city of Sicily virtually from its foundation in 733 BC until its sack by the Arabs in AD 878. It was founded by Corinthian colonists led by Archias, one of the Bacchiad aristocracy of Corinth, who placed his settlement on the island of Ortygia which was well supplied with water: the spring of Arethusa on the waterfront was potable until an earthquake early in the 19th century allowed sea water to seep in. Myth related that, as the nymph Arethusa fled from her lover Alpheus, Artemis saved her from rape by changing her into a spring and her wooer into a river. Strabo claimed that the Alpheus river in the Peloponnese flowed underground to Syracuse where its water mingled with the spring.

The earliest settlers monopolized the land, reducing the native Sicels to serfs, and they became a landowning aristocracy called the Gamoroi. The city prospered, pulling ahead of its nearest rivals Gela and Acragas. It had outgrown Ortygia by the mid-6th century BC, when the island was connected to the mainland by a mole and the population spilled into the Neapolis area. A temple to Apollo was built *c.*565 BC (it is considered the earliest of Sicily's great Doric temples), and it was soon followed by a temple of Olympian Zeus outside the city, south of the river Ciane. In 485 BC the Gamoroi, who had been expelled by a popular uprising of the Syracusan commons and the Sicel serfs, appealed to Gelon, tyrant of Gela, who took Syracuse easily and transferred his headquarters there, conscripting new citizens from Gela and expanding at the expense of Syracuse's neighbours. In 480 BC he destroyed a Carthaginian invasion force at Himera on the north coast, and one monument of this is the Doric temple of Athena which was transformed into the cathedral of Syracuse in AD 640 and is still in use.

Syracuse: the columns of the ancient temple of Athena are embedded in the north wall of the cathedral

Gelon's brother Hiero (478–467 BC) succeeded him as tyrant, but he was a harsh, unpopular ruler, and a year after his death a general uprising ousted his brother and successor Thrasbylulus, and founded a democracy. Yet Syracusan politics were still unsettled at the time of the ill-fated Athenian attack (415–413 BC) which ended with the annihilation of the Athenian forces. Hermocrates, the hero of the Syracusan resistance, was no supporter of democracy, and after the Athenian debacle, when he left Syracuse to lead a squadron of warships to help the Peloponnesian allies, the democratic statesman Diocles persuaded the city to adopt a new constitution and lawcode. Hermocrates was banished in 409 BC, but he returned to Sicily, and in 407 BC he was killed attempting to force re-entry into Syracuse.

Yet one of his followers, Dionysius "the Elder", did manage eventually to seize power and he held it until his death 38 years later. Early in his tyranny Syracuse narrowly avoided capture by a Carthaginian army, which was first weakened by pestilence and finally utterly defeated by a Syracusan attack. Refugees from Acragas, Gela, and Camerina enlarged the city's population, and Dionysius strengthened its defences with walls along the triangular Epipolae ridge and the Euryalus fort (modern Castello Eurialo) at its apex. Dionysius' son and namesake was of a different stripe. Good-natured, impractical, and ultimately oppressive, he toyed with the idea of becoming a Platonic statesman with Plato as his adviser, and for three years (357–354 BC) his step-uncle Dion, having seized power, tried to play the philosopher king and succeeded only in becoming a despot. He was killed by his own soldiers in 354 BC and Syracuse lapsed into anarchy which not even Dionysius II's return to power seven years later could remedy. Finally, with Greek Sicily depressed and Carthage threatening again, Syracusan exiles appealed to Corinth, which sent Timoleon who ousted Dionysius, defeated Carthage, and revived Syracuse.

After Timoleon's death another revolution in Syracuse brought in an oligarchy, and in 317 BC Agathocles seized power, backed by mercenaries from Campania and exiles from the Greek cities. He vigorously resisted the encroachment of Carthage, even invading Carthaginian territory in Africa itself, while at home the conduct of affairs seems to have been peaceful. Disorder followed his death in 289 BC until around 270 BC, when Hiero II began his reign of more than 50 years. Hiero II was a paternalistic despot who shrewdly allied himself with Rome in the First Punic War, and consequently, when Sicily became a Roman province, Syracuse remained a free Roman ally and a centre of Greek culture which could claim the poet Theocritus and the scientist Archimedes. Hiero's successor, his grandson Hieronymus, reversed his policy, but did not live to see the result. A coup overthrew him, and out of the bloodshed that ensued, a pro-Carthaginian faction seized control and Rome laid siege to the city. Syracuse resisted valiantly, helped by the ingenious devices designed by Archimedes, and Carthage sent help, but disease carried off much of the Carthaginian army. Hope vanished by the autumn of 212 BC, and traitors opened one of the gates of Ortygia. In the pillage

that followed, Archimedes was killed by a Roman soldier who failed to recognize him.

Syracuse now became the seat of the praetor or governor of the Roman province of Sicily, and we get a glimpse of the city under Roman rule in Cicero's orations against Verres, a corrupt governor who looted the province. It suffered in the civil war following Julius Caesar's assassination in 44 BC, and the emperor Augustus planted a colony there in 21 BC. In AD 665 the Byzantine emperor Constans II moved his capital there, but he was assassinated in 668 and his plan to remove the imperial capital from Constantinople died with him. The bishops of Syracuse were under papal jurisdiction until the 8th century, but around 733 the emperor Leo III placed them under the patriarch of Constantinople, and the head of the diocese became archbishop of Syracuse, then archbishop of Sicily and, probably from the second half of the 9th century, metropolitan of Sicily. Cultural links with Byzantium were close, and aspiring Syracusan youths sometimes went to Constantinople for their education.

The Arabs raided Syracuse frequently and in 878 they took the city. We have an account of the siege by an eyewitness, Theodosios the Monk, who described it in a letter to the deacon Leo, which has survived complete in Latin translation. The Byzantines recaptured the city in 1040 under George Maniakes, but after his recall the Arabs recovered it, and held it until the Normans took it in 1085. The Arab notables fled when the city fell, and the Normans restored papal jurisdiction and the Latin rite. The Arabs, however, left one memorial: they introduced papyrus, which still grows beside the river Ciane, the only place north of the Equator where it still grows wild.

Modern Syracuse is rich in monuments of the Graeco-Roman past. In Ortygia there are the badly damaged temple of Apollo, *c.*565 BC, and the temple of Athena, now the cathedral, *c.*480 BC. There are also remains of a large unfinished Ionic temple, which would have borne comparison with the great Ionic temples of Hera on Samos and Artemis at Ephesus. On the mainland is the temple of Olympian Zeus, *c.*550 BC, where two columns still stand. The great Greek theatre was remodelled frequently for different uses, and there is a small, unexcavated Roman theatre that was probably used for drama when gladiatorial games became the staple of the Greek theatre. The fortifications of the Epipolae ridge have been extensively modified since they were built by Dionysius I. The great altar of Hieron II was built between 241 and 215 BC for mass sacrifices of victims when the festival of Zeus Eleutherios was held, and the Roman amphitheatre (3rd century AD) is one of the largest still in existence. The Christian catacombs are more extensive than in any other city except Rome. The early Christian churches attest to a vibrant community: one of them, the basilical S. Giovanni Evangelista (6th century?), is the largest church in Byzantine Sicily.

Summary

The chief city of ancient Sicily, Syracuse was founded by Corinthian colonists in 733 BC. In 485 BC Gelon, tyrant of Gela, moved his capital to Syracuse and in 480 defeated the Carthaginians at Himera. After a period of democracy in the 5th century tyranny returned to Syracuse with Dionysius I who continued to fight Carthage. The city prospered in the 4th century BC. It fell to Rome after a long siege in 213–211 BC and became the seat of government of the province. It was taken by the Arabs in 878.

Syria

The name Syria is variously used in ancient sources. At its widest it is applied to the whole area from the Egyptian border to the Taurus mountains covering modern Israel, Phoenicia, Jordan, Lebanon, and a small part of Turkey. More often Palestine and Phoenicia are excluded from it. In late antiquity Syria was subdivided into ever smaller provinces. Greek traders were active at the Syrian trading centre of Al Mina at the mouth of the Orontes river from around 825 BC. At first they shared it with Phoenicians; later they almost monopolized the emporium. In the late 8th century BC Euboeans predominated. In the 7th century BC the most common pottery was Corinthian, from the later 6th century BC Athenian. Through this trade oriental skills came to Greece at the end of the Geometric period: gold workers learned techniques of granulation, filigree, and inlaying; craftsmen, especially potters, decorated their wares with oriental imagery, with sphinxes, griffins, roaring lions, and lions fighting men. Greeks heard stories about the origin of the world and the birth of the gods that were to be reshaped by Hesiod and to become part of the Greek heritage.

Al Mina remained an important centre until after the conquest of Syria by Alexander the Great (331–333 BC), when it was replaced by Seleuceia, founded 6 km to the north in 301 BC by king Seleucus Nicator, founder of the Macedonian Seleucid dynasty that was to rule Syria until Pompey turned it into a Roman province in 64 BC. At the time Syria had few and small towns and as part of his policy of settling veteran soldiers and immigrants from Greece Seleucus founded ten cities: the

biggest was Antioch; second-order cities were Seleuceia, Apamea, and Laodicea; others were Beroea (Aleppo), Chalcis, Cyrrhus, and Zeugma. All were laid out on a grid plan and were given the political institutions of a Greek city. Subsequently Greek culture became exceedingly popular all over greater Syria, and ruling groups everywhere gradually adopted Greek ways. Local gods were identified with Greek deities. Young men took up athletics. Wealthy men spent money to provide Greek-type civic amenities for their fellow citizens. So the Greek way of city life spread from the Greek colonies to native towns and larger settlements. Only among the Jews, thanks to the revolt led by the Maccabee family (168/67 BC), was Hellenization checked.

When the Romans took over Syria they divided the province into city territories and delegated most administrative tasks to the civic authorities. So cities flourished under Roman rule and Hellenism in the cities. While a large part of the country population, and a considerable part of the urban population as well, must have retained their Aramaic language and traditional customs, all visible aspects of their way of life, the architecture of temples and houses, the images of gods, the language of monuments and tombstones, came to be almost exclusively Greek. The earlier literary traditions of the area, except those of the Jews, appear to have faded out. What knowledge we have, for instance about the Phoenicians, has been transmitted through Greek writers. By the 2nd century AD all Syrian inscriptions, except at Palmyra which had a bilingual culture, were in Greek or occasionally in Latin. It was only in late antiquity that Aramaic inscriptions were once more displayed in Syria. This was a consequence of Syriac becoming a literary language in Mesopotamia, especially at Edessa and Nisibis, in an environment that was bilingual in Greek and Aramaic. Syriac was used by Christians in Mesopotamia, and became the liturgical language of the Monophysites in Mesopotamia and Syria, and of the Nestorians in Persian Mesopotamia. Some works composed in Greek have survived only in Syriac translation and Syriac hymnography strongly influenced the development of the Greek kontakion, or short hymn.

The rise of Syriac marks the turning of the tide of Hellenization. The retreat of Greek was accelerated by the Arab conquest of Syria in 638, which resulted in the flight of many inhabitants and the settlement of Muslims, perhaps mainly in cities. For the next two centuries or so, many of the cities nevertheless continued to have large Christian populations. Between 969 and 1084 part of Syria was again under Byzantine rule. In the latter year it was occupied by the Seljuks, but soon after it was conquered by the Christian armies of the First Crusade. The Crusaders established the princedom of Antioch, which in 1108 was forced to recognize the suzerainty of the Byzantine emperor. The link with Byzantium was finally

broken in 1268. Subsequently Syria was governed first by Mamluks and then by Turks.

Tarentum

City in south Italy

The city of Tarentum (modern Taranto), a colony of Dorian Sparta, was situated on the north coast of the gulf of Tarentum facing the Ionian Sea. The acropolis is perched on a peninsula between two harbours – a main outer harbour and an inland tidal lagoon. It was one of the best ports in southern Italy, with access to good cornlands in the interior.

The literary tradition records that the site was founded in 706 BC (Eusebius, *Chronica*, 91b Helm); the archaeological evidence supports this date. Myth relates that the settlement was established by a group of *Partheniai*, the illegitimate offspring of helots, or slaves, and Spartan women, led by their founder, the *oikistes* Phalanthus. The Delphic oracle directed the settlers to found a colony on the south coast of Italy, rather than closer to home in the Peloponnese, in effect legitimizing colonization by means of war and conquest. What is certain is that this was a group of dissatisfied Spartans, perhaps remnants of the pre-Dorian population or others disenfranchised in the aftermath of the First Messenian War (743–724 BC), affected by a social crisis involving land and status. The site was established through the conquest and expulsion of the native inhabitants – Iapygians, Peucetians, and Daunians. Tarentum is unusual in that it had a "double" founder; the second was the eponymous hero Taras, the mythical leader of the pre-Greek Iapygian settlement.

The area was known to the Greeks, especially the Rhodians, from the Mycenaean period on through trade. Despite this long history of contact, the original settlement expanded only slightly to the southeast in the Archaic period, as the inhabitants were afraid of the native tribes. In the late 6th or early 5th century BC Aristophilides appears to have ruled according to a constitutional model based on that of Sparta, with kings and ephors – officials elected both by lot and by vote. The colony retained Spartan cults in their new homeland, continuing to worship Apollo Hyacinthus, and Spartan rituals, such as the burial of the dead within the city walls. It also continued to maintain close ties of kinship with its mother city. There are few remains of the Greek city today because modern Taranto occupies the same site, but Strabo (6. 3. 1) mentions an Archaic Doric temple thought to be dedicated to Poseidon (late 6th century BC), an altar to Aphrodite, a sanctuary of Demeter and Persephone (containing terracotta votive offerings from the 7th and 6th centuries), and other religious structures.

In the early part of the 5th century BC Tarentum enjoyed victories over its Messapian and Peucetian neighbours (*c.*490 and 460 BC), taking slaves and expanding along the coast to the southwest. The city commemorated these events with the erection of a monument at Delphi. In *c.*475 BC, though, it suffered a crushing defeat at the hands of a native confederation led by the Iapygians, and much of the aristocracy was destroyed, providing the impetus for the establishment of democracy (Herodotus, 7. 170). At the end of the 5th century BC the settlement began to expand once again, filling the vacuum left by the destruction of its rival Croton, a powerful city to the west. This expansion brought Tarentum wealth and power, and it now became the leading Greek centre in southern Italy. In 433 BC the city founded a colony itself at Heraclea (Policoro) on the west coast of the gulf, which acted as a counterweight to the Athenian colony at Thurii, and served as the new head of a league of Italiot Greeks. It was allied with Syracuse in the Peloponnesian War, contributing ships to the cause and sending corn to Sparta, in an attempt to offset Athenian power in the region as well as support its mother city. Consequently it was invaded by the Athenians.

Tarentum began to develop a reputation for possessing many great works of art. Among others, Pythagoras of Rhegium created a famous statue of *Zeus and Europa* which graced the city centre. In the same period the Apulian school of pottery, founded by Greeks who came from Thurii to Tarentum, established its centre in the city (*c.*420 BC). This school was known especially for its representations of myth and comic parodies on the vessels it produced. Much of what we know about Greek theatre today is illustrated by the images painted on these vases. Terracotta figurines and antefixes were also widely exported from the city.

Tarentum attained its greatest wealth and power in the 4th and 3rd centuries BC, at which time it became the pre-eminent city in Magna Graecia, renowned for its luxuriousness. The extent of its wealth and political power is indicated by the great number of goods produced in the city, as well as its attractive series of coins, which were distributed widely around the shores of the Mediterranean Sea. In the early 4th century BC politics were dominated by Archytas, a Pythagorean philosopher-mathematician and friend of Plato, who expanded Tarentine influence in the area. After the mid-4th century BC

the city's difficulties with the surrounding native tribes increased, and it requested help first from Sparta, and then from a series of mercenary princes and kings. Initially it called upon Archidamus III of Sparta (338 BC), who died in battle. Then Alexander I of Epirus came to its aid. In the beginning he was successful, but was eventually slain *c.*330 BC. The next call for help was directed to Cleomenes of Sparta, who also ultimately failed.

Tarentum was host to many famous residents and visitors in this period. Aristoxenus, a philosopher and musician, developed his theory of harmonics there. Rhinton was a comic dramatist who popularized *phylax* farces – local productions that drew on daily life for their inspiration. It was famous as well for its fine works of art, both large and small. At this time Lysippus of Sicyon created a large bronze statue of *Zeus and Hera* for the city. It was a major centre of production for votive figurines of terracotta, primarily religious in nature, which were precursors of the well-known Athenian and Tanagran types. It was also known for its limestone architectural sculpture adorned with human figures.

Towards the end of the century, the inhabitants of the city became fearful of the growing power of Rome, and felt threatened by Roman aid to the nearby cities of Thurii, Locri, and Rhegium. Despite having signed a treaty in 303 BC, in the early 3rd century Tarentine forces attacked Roman ships in the harbour and insulted the Roman ambassador. These actions precipitated war with Rome. Tarentum once again enlisted the help of an Epiriot ruler, Pyrrhus, who responded to its request in 281 BC. The Tarentines were soon joined by the native tribes of the Bruttians, Lucanians, and Samnites. At first Pyrrhus enjoyed a number of successes, especially against the Carthaginians in Sicily, but the city felt threatened by the king's growing power and his plan for a united kingdom of Sicily and lower Italy, and withdrew its support. Upon Pyrrhus' departure, the Romans took over in 272 BC, forcing territorial concessions from the Tarentines. The city became an ally of Rome in 270 BC and the struggle for the control of central Italy was over, with Roman domination of lower Italy now assured. Many of its art treasures were carried off to Rome. At this time the city was the home of Livius Andronicus, a Greek-born slave, who produced comedies, tragedies, and a Latin translation of the *Odyssey*. He played an important part in the creation and development of Latin literature.

A group of Tarentine aristocrats revolted in the Second Punic War (218–201 BC) and went over to Hannibal (213 BC), who fortified the lower city, but it was retaken by Rome in 209 BC. The extension of the Via Appia and the founding of Brundisium (Brindisi) undercut its trade, and part of its territory was confiscated.The city declined from this period on, although it probably regained allied status in 180 BC. It subsequently received colonial status and became a provincial Italian town, but there is much epigraphical evidence of civic activity and mention of the importance of its products – wool, textiles, purple dye made from the processing of murex shells, and agricultural produce. Strabo maintained that the city was still linguistically and culturally Greek in his time (6. 1. 2), but this is controversial. Horace (*Odes*, 3. 5. 53–56) described it as a suitable holiday place for a tired businessman.

From the late-6th and early-7th centuries AD, Tarentum was fought over by the Lombard princes operating from their stronghold at Beneventum (Benevento), and the Byzantine Greeks inhabiting the heel of Italy to the south. After the Italian dukes and the Greeks together took Muslim pirates into their employ in the early 9th century, Saracens from north Africa and Spain entered the fray. The city was destroyed by the Saracens in 927, but was rebuilt by Nikephoros Phokas, who re-established Greek as the common language, and brought the city back into the Greek fold. The southwards-expanding Normans, under the adventurer Robert Guiscard, were invited into the region as mercenaries to fight against the marauding Arabs. The Normans benefited from continual dissension in the area, and finally took control of the city themselves in the 1060s.

Summary

Founded as a colony of Dorian Sparta, traditionally in 706 BC, Tarentum played an important part in establishing a Greek presence in southern Italy. It was a centre of Greek culture and power in Magna Graecia, renowned for its fine works of art and luxurious lifestyle attained through the benefits of trade. It fell to Rome in 272 BC. It was destroyed by the Saracens in 927 and rebuilt by Nikephoros Phokas.

Taxation

Taxes are compulsory levies imposed by the state primarily for the purpose of financing government expenditure. They are commonly classified as either direct or indirect. Direct taxes are levied on an individual's income or personal wealth (e.g. imposts on income) while indirect taxes are assessments on transactions or services (e.g. customs duties). Since taxes are imposed by the state, the nature of the levies collected by each government reflects the interests of the group in power. Thus any treatment of taxation involves discussing the nature of the government imposing the levies in question.

The earliest Greek taxation system that can be discussed in detail is that used by the kingdoms that ruled Greece in the Mycenaean period. In this system each village was responsible for producing specific amounts of individual commodities such as wool and wheat. Taxes were thus of the direct variety and were paid in kind, i.e. with produce rather than with money.

The simpler forms of government that arose after the collapse of Mycenaean civilization adopted equally simple forms of taxation. The ruler (a relatively weak king) was given the use of a piece of public land, the produce of which supported the royal household and paid for the few public functions that were undertaken.

The more complex forms of political organization that arose around 800 BC made use of three basic taxation systems. The simplest of these was used exclusively by Sparta, which was ruled by a fairly numerous military elite. The members of this group were exempt from all taxes and were fully supported by mandatory contributions in kind levied on the serfs assigned to each individual's estate. Apart from small gifts presented to royalty, no other regular taxes existed.

The second system of taxation of interest here was used primarily in cases where the state was ruled by a limited number of individuals. Examples include Corinth under the Cypselid family (*c.*650 BC) and Athens under Pisistratus and his sons (*c.*540 BC). This system relied on direct taxes imposed on the entire population. The most important imposts were a 10 per cent levy in kind on agricultural produce and a yearly fee (a head or poll tax) due from each individual. Indirect imposts, including customs duties and sales taxes, also played a role. The payment of direct taxes by the entire population was a reflection of the concentration of political power.

The link between political power and taxation is also evident in the third system, which is most clearly known from its manifestation in democratic Athens (510–322 BC). Democracy entailed the participation of a substantial number of citizens, who expected to be compensated for their services. At the same time, the obligation to pay direct taxes was seen as a form of subservience. The existence of a democratic government thus meant that a significant revenue stream had to be generated without the imposition of direct levies on most of the state's residents.

A vast variety of indirect taxes were levied on all Athenians. These included customs duties, sales taxes, and levies on banking transactions. Direct taxes in the form of a head tax were paid only by resident aliens. However, the limited number of non-citizens made direct taxation on citizens unavoidable. This taxation took the form of "liturgies". A liturgy was a governmental expense, such as the maintenance of a warship, that was assigned directly to an individual. The liturgist was responsible for providing all necessary funds to complete the designated project. In Athens the wealthiest residents, both citizens and aliens, served as liturgists. This practice was politically expedient since it provided government financing without the use of a direct tax.

The practice of imposing liturgies also simplified the state's administrative duties. The vast number of individual taxes that were imposed and the fact that Athenian taxes were due in the form of money rather than in kind made the collection and supervision of revenue a complicated process. Liturgies provided one solution to this problem by uniting taxation and expenditure. Tax farming was another solution.

Rather than appointing agents to collect taxes, the Athenian state auctioned off ("farmed") the right to procure the revenues generated by a particular impost. In exchange for an advance payment to the state, the tax farmer was granted the right to collect a specific impost for a specific period of time. This practice had two advantages. First, the administrative demands placed on the state were greatly reduced. Second, the yield of each impost was known and acquired in advance. This greatly simplified the process of planning and financing government expenditure.

This system of taxation was shaped by the diffusion of political power engendered by democracy. Other Greek states with democratic government structures took a similar approach to taxation. The political evolution of Greece, however, moved in a direction that made such situations unusual. By the end of the 4th century BC most of Greece was ruled by large kingdoms. The taxation system used by these kingdoms bore a striking resemblance to that used in earlier Greek states ruled by a limited number of individuals. Direct taxes in the form of levies on agricultural produce and a head tax were the primary sources of government revenue. The needs of the kingdoms were such that taxes were levied in monetary form, which again complicated the process of collection. This prompted the use of tax farming.

In spite of the fact that the identity of the state controlling Greece changed on numerous occasions over the course of the centuries, this system of taxation remained in operation with only minor changes well into the 19th century AD. The Byzantine empire (*c.*330–*c.*1453) drew a substantial portion of its revenues from two different direct levies, both of which were payable in cash on an annual basis. A land tax was collected in the form of a flat charge per unit of acreage owned (the *modius*, equal to 0.08 hectares), with some allowance for varying soil fertility and the use to which the land was put. Each household also paid a hearth tax (in essence a collective head tax imposed on each family unit). Non-Christians were obligated to pay a special yearly impost in addition to the

hearth tax. Indirect levies in the form of customs duties and market and inheritance taxes were also collected. As was the case earlier, tax farming was extensively employed during the Byzantine period.

During the Tourkokratia (*c.*1453–*c.*1832) the Ottoman empire, which took control of Greece after the collapse of the Byzantine empire, left the pre-existing taxation system largely intact. The most important differences between the Ottoman system and that of their Byzantine predecessors consisted of the collection of a significant amount of taxes in kind (rather than in cash) and the imposition of special head taxes on non-Muslims rather than on non-Christians. The high degree of continuity between the Byzantine and Ottoman periods is also observable at the end of Ottoman rule in that the newly independent Greek state made relatively few immediate modifications to the extant tax structure.

Over the course of time, however, two major changes took place. First, the gradual construction of a revenue collection system based on western European models made it possible for the Greek government to phase out tax farming. The first sustained effort in this direction began in 1847. Second, there was a distinct trend away from direct levies. Imposts of this kind were strongly associated with political subjection and were thus largely replaced by a variety of indirect alternatives. By the mid-1980s Greeks were paying more than 500 different indirect taxes.

Greece's reliance on indirect taxes continues to the present. About 65 per cent of the national budget (excluding social insurance) is still provided by indirect levies. This is at variance with the practice of most other European states, which finance most of their expenses with direct imposts. Direct taxes are widely used outside Greece because they are relatively easy to collect and because they can be used to reduce the inequality of income distribution, an important goal in many countries. Whereas indirect taxes are imposed at a uniform rate on all individuals regardless of their income, direct taxes can be tailored so as to take a progressively larger share as the total income rises. Rich individuals are thus obliged to turn over a larger percentage of their wealth than poor ones. The ability of direct taxes simultaneously to raise revenue and to reduce income inequalities makes this form of impost highly attractive. During the 1990s the Greek state initiated a series of reforms intended gradually to replace most indirect taxes with direct alternatives.

Technology

Technological discoveries and importations from elsewhere are notoriously hard to date in the ancient world. Many techniques leave little or no archaeological evidence and literary mention is sporadic and incidental before the Hellenistic period. Even then from the 3rd century BC we have little other than the Aristotelian *Mechanical Problems* (perhaps by Straton, the head of the Lyceum from *c.*287 to 269 BC) which, though primarily theoretical, does deal with problems in applied mathematics involving levers, compound pulleys, etc. The inventor Ctesibius wrote a treatise on pneumatics (now lost but used by later authors), while his contemporary Archimedes, apart from a lost treatise on how to build a spherical planetarium, chose deliberately to write only theoretical mathematical treatises. Around 200 BC Philon of Byzantium composed a compendium of technology whose main concern was the construction of mechanical devices: surviving books deal mainly with pneumatics and war machines. More remains from the Roman period. The tenth book of Vitruvius' Latin treatise *De Architectura* (*c.*25 BC) details relevant technical devices largely drawn from Greek predecessors. The great *Natural History* of the Elder Pliny (mid-1st century AD), despite its title, ignores virtually no field of human endeavour and preserves much information from lost Greek sources. His contemporary Heron of Alexandria is our principal authority for ancient technology, although his books on mechanics survive only in an Arabic translation and in extensive quotations by the 3rd- to 4th-century Pappus of Alexandria. From the Byzantine period little of use was written and even less survives: in the 4th century Oribasius described mechanical constructions for resetting dislocated limbs; the 5th-century alchemist Zosimus described chemical apparatus and recipes for smelting, dyeing, etc.; while, unfortunately, most of the treatises on mechanics and hydraulics by Anthemius of Tralles

(the innovative architect of Hagia Sophia, Constantinople) are lost. Later works are almost entirely mere reworkings of inherited knowledge.

Until the Hellenistic period the Greeks largely used technology that was already existing in the eastern Mediterranean at the time of their arrival in the late 3rd millennium BC, and remarkably few advances were made. The conservative attitude of the Classical period, known in many other areas for exuberant originality, is sometimes attributed to the existence of slavery, but is more probably due to a cultural attitude of the intellectual elite which elevated "pure" far above "applied" knowledge. Even the famous black- and red-figure Attic pottery in the Archaic and Classical periods depended upon a refinement of a technique known as early as the Middle Helladic age (*c.*2000–1500 BC). The Attic potters placed their pots, painted with a clay slip containing iron oxides, in a wood-fired kiln which with the air vents open produced an oxidizing phase, thereby turning both painted and unpainted parts red, up to a temperature of 800°C, between which and 945°C closure of the vents and the introduction of smoke-producing green wood created a reducing phase in which the whole pot turned black. Subsequently the temperature was allowed to decrease and at about 900°C the vents were reopened to create the final, reoxidizing, phase in which the unpainted parts became red again while the sintered areas remained black.

The most advanced technology before the Hellenistic period was probably metallurgy: alluvial gold was caught in fleeces; gold and silver were extracted from lead by cupellation; and ore-bearing rocks were pounded and washed or heated in a blow- and later bellows-heated furnace to separate metal from gangue. The ability to attain a temperature sufficiently high to form iron blooms for hot-hammering (first managed perhaps by the Hittites *c.*1400 BC) was the single most important technological change in Greek history and may have been partly responsible for the downfall of the mainly bronze-using Mycenaeans. Alloys, especially of copper, were developed for specific purposes and soldering was practised. Implements were made by hot- and cold-hammering or casting (including the lost-wax process). Decorative processes included repoussé work and niello inlays (both known in the Mycenaean period), filigree, and granulation. Metal tools in the Classical and especially Hellenistic periods became increasingly precise. Notably carpentry was provided with hammers, chisels, saws (including the frame saw), and planes, while surgery benefited from a wide range of specialized implements. Locking devices also became increasingly ingenious.

The farmer raised water with the *shaduf* (swing-beam with compensating weight). Tillage of the soil was accomplished through the hoe and the usually ox-drawn ard-plough; seed was broadcast by hand from a container slung round the neck; harvesting was done with sickles; grain was separated from chaff by flailing or threshing, in which centrally tethered animals were driven round a threshing floor and the chaff carried away by a breeze when tossed in the air by hand with the grain from a winnowing basket or by a winnowing fan; milling was done in querns. There was little change in agricultural methods until the addition of the threshing sledge, animal- and water-powered mills, and the rare animal-driven reaping machines in the Hellenistic and Roman periods.

Raw, wetted pelts were moulded over hard cores into containers which became stiff when dry. Cleansed pelts cured with salt or sun-dried were rendered imputrescible and water-resistant by numerous vegetal tanning agents with varying resultant colouration, but there is also some evidence for tawing by minerals. Malleability could be achieved by chamoising, the subsequent rubbing with animal fat, which is mentioned already in the *Iliad*.

Spinning was done most commonly by twisting carded wool (or other fibres) drawn from a distaff on to a suspended spindle to which was attached a whorl to steady rotation. Weaving was done on a warp-weighted vertical loom, the threads alternately hanging straight down or passing over a horizontal shed-rod. Different weaves were attained by manipulation of heddle-rods. During the Roman period the loom at which a standing weaver pushed the weft upwards with the weaving sword gave way to one at which a seated weaver pressed it down with a comb, which was itself replaced in turn by a horizontal version. Specific looms for specific fibres were also being designed.

The Hellenistic and Roman periods were by far the most productive time of technological development in Greek history. Nevertheless, despite important practical advances, especially in the areas of building and war machines, even then a love of theory resulted in the invention and description of many contrivances of such great inefficiency that, even if models were ever built, they could not have served any practical purpose. Most notable in this respect are Heron's descriptions of a ball revolving on its own axis through the emission of steam from angled vents, and his device for covertly opening (and closing) temple doors by the pressure of air heated by fire on an altar forcing water to flow into a bucket which in turn tugged cords wrapped around a subterranean extension of the door-posts. On the other hand his related description of figurines making libations when a fire was lit on an altar is eminently feasible, as is Philon's automaton that alternately handed guests a pumice stone and poured water for washing, which led ultimately to similar but far more complex robots in the Islamic world. Toys, such as Heron's automatic theatre which could mechanically produce a puppet show in several acts, were probably made for amusement, while ingenious hydraulic devices that gave moving figures to fountains were to have a long history. One Athenian device of the mid-4th century BC was certainly of practical benefit: the stone *klerotérion* precluded jury-rigging by enabling black and white balls to fall randomly from a hopper down a tube at the side of a series of rows in which potential dicasts had inserted their metal tickets.

In mechanics we find that the lever, which had been known since the Neolithic age, had multifarious applications (e.g. for raising objects and as a steelyard). While the lever-press became common (the wedge-press was also invented), perhaps the most surprising anticipation of the modern world to employ the lever was a slot machine for dispensing ritual water upon insertion of a coin (but whether this was ever constructed or is merely theoretical is not known). The winch and the pulley (both known much earlier separately) were combined in hoisting- and pulling-engines, while compound pulleys became increasingly effective (often incorporated into cranes powered by human treadwheels). The endless rope or belt, however,

seems not to have been employed for transmitting power but only when itself driven, as in the bucket chain for the raising of water (activated by a treadwheel). Both horizontal and vertical capstans were widely used, while Drachmann (1973) believed that the crank had been invented by Archimedes and underwent subsequent experiments, although strangely this simple but efficient mechanism never enjoyed widespread application until the later Middle Ages, and certainly never appeared in antiquity with a connecting rod.

Of great importance was the invention of the screw-line ("the snail on the cylinder"), attributed to Apollonius of Perge, a younger contemporary of Archimedes who promptly employed it in his *cochlea* ("water-snail") for the raising of water. Screws were used more for moving and adjusting than for holding down (in which role they first appear in goldsmithery). Cortesponding female screws made large presses (e.g. fullers' and olive-presses) more efficient than the alternative lever- and wedge-presses. Female screws were first cut into a split block which was then rejoined, but Heron describes a machine for their manufacture. The impossibility of making them small, however, meant that many instruments (e.g. the gynaecological *specula matris*) had to use the inferior method of a screw with an engaged peg.

Cogwheels, of wood for large machines and of metal for small, were employed for transmission in four ways. The rack and pinion is first attested in a water clock made by Ctesibius, but is not found again until Heron's toys (e.g. a self-snuffing lamp). Archimedes is credited with both inventing and employing in war machines the endless screw (the worm-and-wheel gear), but it does not appear again until Heron, who used it for, among other devices, his surveying instruments the *dioptra* (theodolite) and hodometer. Chronologically next probably comes the use of parallel engaging wheels. Although these were generally inefficient owing to an inability to find the optimum shape, there has been found in a shipwreck off the island of Anticythera a calendarial celestial computing mechanism from *c.*80 BC (the sole surviving machine from antiquity) containing three brass dials and 31 cogwheels of different sizes with teeth in the shape of equilateral triangles: that this was actually used is proved by the evidence of repairs. Toothed wheels engaging at right angles are not attested until Vitruvius, who describes an undershot water wheel that gives motive force to a corn mill, a device of longterm practical benefit. (An overshot wheel is depicted in the Roman catacomb of S. Agnese in a representation of probably the 3rd century AD, probable remains of one from the 5th century have been found in the Athenian Agora, and a certain example has been recently excavated from 9th to 10th century Byzantine Thebes. The wind-driven wheel, mentioned for Seistan, Afghanistan, in the 10th century AD, did not appear in the Greek world until the 14th apart from a miniature experimental usage by Ctesibius.)

In hydraulics and pneumatics the most important advance was in the increasing application of the syphon (used earlier for mixing liquids), which led not only to ingenious toys and drinking vessels (such as one still made in a Chiot village) but to the ability to force water to rise in aqueducts (at Pergamum in the 2nd century BC the citadel was served at 155 m above the lowest level of the aqueduct). Ctesibius' experiments in pneumatic machines, such as his organ (operated from a keyboard) in which water pressure forced air through pipes, led him to the invention of the force pump with cylinders and plungers operated by horizontal levers and vertical connecting rods. One adaptation for fire fighting had a nozzle that could be swivelled in any direction and tilted both ways. Surviving examples of pumps have both flap valves and the superior spindle valves. Ctesibius also improved the accuracy of timekeeping by ensuring a uniform flow in the *klepsydra* (water clock), to which he attached, in addition to all manner of entertaining automata, a figure with a pointer to indicate the hours on a column. Vitruvius describes a later water-driven clock which more efficiently adjusted the varying length of ancient hours on a revolving disc engraved with the zodiacal constellations.

Of great practical value was the development, probably in Hellenistic Syria *c.*100 BC, of glass blowing. Hitherto only modelled around a core of sand or poured into a mould when molten or carved when cold by hand or lathe, glass now became a common and relatively cheap material for vessels of daily use. More expensive articles were subject to an exuberant range of decorative processes including marvering, trailing, engraving, and painting, while openwork cage cups were carved from thick blanks. Gold glass, in which gold leaf carved into patterns or figures was placed between layers of transparent glass, appears to be an early Hellenistic innovation. Lenses are known from the Bronze Age onwards, but they remained a craftsman's (engraver's) tool and are not mentioned in any theoretical treatise on optics. By the 5th century BC they were being employed also as burning mirrors. Glass was used in addition for reflecting mirrors (sporadically from *c.* 600 BC as cosmetic aids and later both for signalling and in lighthouses), for lamps (from the Hellenistic period), in small panes for windows, and in sheets cut into tesserae for mosaics (both from the Roman period). Stained glass was developed, if not perhaps invented, by the Byzantines.

Its Classical inheritance allowed Byzantium to remain the most technologically advanced state in Europe and the eastern Mediterranean until at least the 12th century. It acted, moreover, as a conduit for ancient knowledge to the Islamic world and of Islamic (e.g. of damascening) and even barbarian knowledge (e.g. of the stirrup from probably the Avars) to the West. Nevertheless, Byzantine technology did suffer from the subordination of mundane to heavenly affairs. Apart from a few minor improvements to existing machines (e.g. water mills and a geared quern), ingenuity was largely expended on the making of automata, notably in the 9th and 10th centuries when there was a rivalry with the caliphal court: water-driven clocks indicated the hours with an impressive display of moving figures; compressed air from bellows or water power lifted an imperial throne into the air, caused lions to roar and wag their tails, birds in golden trees to warble and flutter their wings, and figures on fountains to make appropriate movements. Atypically, in the mid 6th century, Anthemius is reputed to have driven away a neighbour and personal enemy with a powerful reflector and contrivances that created artificial thunder and, by steam power, a mock earthquake; the emperor Theophilos in the 9th century was praised for his construction of organs (pneumatic rather than hydraulic as in Heron's original instrument); while in the 11th century Psellos claims to have repeated some of the experiments of Heron.

The most famous invention was Greek fire (which nonetheless may possibly have been of Arab origin) and the most bizarre a paddle boat driven by pairs of oxen attached to capstans in the hold of the vessel, which is described in a Latin treatise of probably the late middle of the 4th century AD, the anonymous author of which was probably a westerner despite some scholars' belief that he was a native Greek-speaker. While useful progress was mostly made in pharmacological and chemical technology, a few other discoveries, improvisations, and technical improvements are known or suspected. The general Belisarius mounted wheels between pairs of boats furnished with mills when the besieging Goths had cut the supply of water to Rome in AD 537; by the 6th century wooden stamps for printing fabrics were employed in Byzantine Egypt and at that time and subsequently refinements were made in silk-weaving looms; Leo the Mathematician devised a beacon system in the 9th century (at which time mention was also made of a water clock with an alarm to awake the monk deputed to rouse his brethren); from the 9th to the 13th century great advances were made in enamelling techniques; an ox-driven mechanism for kneading dough appeared in the 10th; new techniques improved the staining of glass in the 10th and made it more durable in the 11th and 12th; and a more efficient method of stacking pots inside each other and separating them by tripod-stilts facilitated mass-production in the 12th century.

The period of foreign occupation that followed the fall of Constantinople in 1453 allowed little scope for technological innovation. The independent modern state of Greece preferred to establish its literary rather than scientific credentials before the 1980s, since when the Ministry of Education has made a determined effort to promote technology at the secondary and tertiary levels.

Textiles

Textiles are highly perishable and rarely survive the ravages of time. Our knowledge of them comes from a variety of sources, including archaeological finds, pictorial representations, and written sources.

In the Near East the use of flax to make linen cloth predates silk, cotton, and the domestication of sheep for wool by several millennia. The oldest textile in the world, a woven linen fabric adhering to a tool excavated at Cayonu in southeastern Turkey in 1993, is dated to about 7000 BC; wool did not appear in the Balkans until about 3500 BC.

The history of textiles in Greece begins in early Minoan Crete (*c.*2300 BC) where excavations at the prehistoric village of Myrtos turned up the first evidence for cloth production: sheep bones, tubs for washing wool, bowls for wetting linen thread, and clay spindle whorls. These finds indicate that the Minoans knew how to spin both flax and wool. Remnants of cloth from other sites in Bronze Age Greece and Turkey reveal the human penchant for decorating cloth. At Troy, for example, Schliemann found a linen textile embellished with tiny blue-green faience beads from *c.*2600 BC.

Evidence from later Minoan Crete and Mycenae (1600–1150 BC) tells the story of a flourishing textile industry. The men tended flocks of sheep in the countryside; women spun yarn and wove cloth in the palaces. The sheep were caught and plucked, because shears had not yet been invented to cut the wool from the sheep's back. Early breeds of sheep moulted fine wool from their coats, leaving the bristly kemp hairs, which moulted later. The wool was brought to the palace and weighed, then distributed for cleaning, combing, and spinning. The oils and fats were removed from the wool and retained for use in perfumes and ointments. Spinners worked in groups; weavers worked in pairs. Greek women did not spin on wheels, but on spindles. The spinner held the fibre-laden distaff in her right hand; from this she drew out the fibre and twisted it into thread with the aid of a spindle weighted with a whorl. Large numbers of ancient spindles and whorls have been found in archaeological digs.

The warp-weighted loom, for which ancient Greece is well known in textile history, was apparently already in use among Mycenaean weavers around 1400 BC. The Linear B script lists "cloth with white edges" or "cloth with coloured edges", indicating the use of starting bands typical for weaving on warp-weighted looms. (The starting bands were made by specialists who wove on small band looms.) These bands stabilized the warps which were suspended from a horizontal bar on vertical supports. The warps were anchored at the lower end with clay weights. A shed rod divided the warps, half in front, half at the back. The rear warps were attached to a heddle rod which, when lifted, created a shed through which the weft was inserted. The weft was beaten upwards, towards the horizontal bar, with a sword-like shuttle. Herodotus wrote of "pushing the woof [weft] upwards". Generally the looms were no taller than the weaver's reach, although one depiction of a warp-weighted loom shows the weavers wearing platform shoes to gain height. With warp-weighted looms, the length of the cloth was limited to the height of the loom. However, the loom allowed the manufacture of wide cloth with three finished edges.

Minoan artwork depicts elaborately patterned and coloured textiles, implying advanced weaving skills and a knowledge of dyeing. Patterns include rosettes, grids of tiny diamonds, and spirals. Such patterns could have been embroidered, painted, or woven. Wool, the most common fibre, was easy to dye. The known dyestuffs included two classes of dyes, direct and vat. Direct dyes, unlike vat dyes, required the addition of a mordant, probably alum, to fix the dye to the fibre. Minoans and Greeks used direct dyes such as madder roots and scale insects called kermes to obtain reds; saffron lilies yielded yellow. Woad and murex shells were the two main vat dyes, the former yielding blue, the latter purple. The Minoans may have exported their patterned textiles to Egypt where, according to Barber (1991), they were copied and used for canopies and banners.

Textile making was women's work in Greece. Homer's *Iliad* and *Odyssey* suggest that weaving was a task fit for queens in Mycenae and Troy. While living in Troy, Helen wove "a purple double-layered cloak" depicting the struggles of the Trojans and Achaeans. Odysseus' wife Penelope spent three years weaving a complicated pictorial cloth by day, unravelling it at night in an attempt to dissuade suitors who believed her long-absent husband was dead. Women were so important to the Mycenaean textile industry that raiding soldiers captured them to weave as captive labourers. So many were brought to Mycenae that they most likely made textiles for export. In Classical Greece women of all ranks spun and wove. Mastery of such household tasks signified a virtuous female. A 6th-century BC vase in the Metropolitan Museum of Art in New York shows women participating in all phases of textile work from weighing the wool fibre to folding the finished cloth. Woven textiles were used for clothing, bedding, hangings, cushions, towels, banners, burial shrouds, and sails. Greek women were proficient at other textile techniques besides weaving, including a type of knotless netting called "sprang". Vase paintings show women working with small frames to make elastic-like fabrics, probably for hairnets.

Only a few textile fragments survive from Classical Greece. The royal tomb at Vergina in Macedonia, believed to be the final resting place of Philip II of Macedon, father of Alexander the Great, contained a fragment of a purple cloth embroidered with gold. A funerary urn from Koropi, near Athens, held a fragment of linen embroidered in gilt silver in a diaper pattern with small lions in the centre of each lozenge. Several specimens unearthed in a Greek colony in the Crimea comprise tapestry-woven, embroidered, painted, or resist-dyed textiles incorporating either scenes from Greek mythology or geometric motifs.

Cotton, hemp, and silk appeared by the 5th century BC, attesting to the extensive trade networks developed by the Greeks. Cotton originated on the Indian subcontinent, hemp in northern Europe, and silk in China. Several purple and white silk textiles found in a late 5th-century BC tomb in Athens raise questions about when silk arrived in Greece. Silk is the only filament-length fibre in nature, and silk fabrics were thus prized for their smooth, lustrous surfaces. China, Korea, and Japan kept knowledge of sericulture, the raising of silkworms for fibre, a closely guarded secret while exporting both fibre and finished fabrics to the Mediterranean world. Although wild silk was known in the Classical era, was not until trade routes were developed across Asia that cultivated silk was brought to Greece and Rome during the Hellenistic period. According to legend, around AD 550 two Byzantine monks smuggled silkworm eggs and mulberry leaves out of China and presented them to the emperor Justinian, who subsequently established the cultivation of silk in Byzantium.

During the Graeco-Roman period an important technical change occurred. Around the 4th century AD weavers began to work on horizontal looms that had two rigid bars, one for warp and the other for finished cloth. This loom allowed for longer, but narrower fabrics. The transition from vertical, warp-weighted looms to two-bar horizontal looms can be seen in the changing construction of numerous tunics that survive from Coptic Christian burials in Egypt (3rd to 12th centuries AD). These tunics were made of undyed linen with tapestry sections of dyed wool.

Byzantine Greece supplied silk and skilled weavers to the imperial workshops of Constantinople, which had incorporated techniques and motifs from the great silk-weaving centres of Persia and Syria. Constantinople was renowned in the 10th, 11th, and 12th centuries for compound silk textiles. The trade was strictly regulated, but the city exported silk to

Europe where a substantial number of fragments remain in church treasuries. Perhaps the best known is the Quadriga cloth in Aachen cathedral which depicts a charioteer driving four horses. Silk weaving in Byzantium degenerated in the 13th century, but the art of embroidery continued to flourish for church vestments.

Embroidery also flourished in the Greek islands and in some parts of the mainland. Major museums in Greece, Britain, and North America have magnificent examples of needlework including bed tents and valances, cushion covers, spreads, and women's bridal and festival clothing. The embroideries are grouped stylistically by region, because the preferred motifs and stitches reflect local cultural influences. Italian-inspired designs prevailed in Crete and the Ionian islands; Byzantine eagles and mythological creatures were found in the Sporades. Ottoman floral motifs dominated the work of Epirote embroideries, while geometric designs deriving from the Neolithic era were seen on bridal dresses from the mainland. The embroideries of the Dodecanese and the Cyclades featured stylized motifs from nature (i.e. birds, flowers) which are reminiscent of Italian textiles of the same period.

Lace, which originated in Renaissance Italy, was introduced to the Greeks by nuns in Catholic monasteries in the mid-17th century. The technique of making lace, or *danteles*, quickly spread throughout the islands where it flourished during the 1700s. Using needles, bobbins, or drawn threadwork, Greek women created lace borders for bedcovers and other household linens as well as a narrow lace trim known as *bibiles* for the edges of chemises and headscarves.

Greece inspired the textiles of other countries centuries after the eclipse of the Hellenistic world. About the time that democratic ideals arose in Europe and America in the 18th century, designs from Classical Greece and Rome began to appear in French and English textiles. From 1790 to 1830 motifs incorporating ancient ruins, Greek keys, palmettes, Classical drapery, pillars, and columns were printed on, or woven into, textiles indiscriminately labelled "Grecian", "Etruscan", or "Pompeian". Generally large in scale, these textiles were widely used for bed hangings, draperies, and upholstery in Neoclassical interiors.

Fibre production, spinning, and weaving took place in every Greek village until recently. Women used wool, goat's hair, cotton, linen, and hemp. They wove sheets, blankets, cushion covers, and yardage for clothing to stock their dowries. The industrial revolution brought new factory-made textiles and chemical dyes to Greece. Villagers selectively absorbed these commercial products (especially cotton calico and muslin), eventually laying aside their homemade textiles in favour of manufactured cloth. Today women make handwoven textiles for tourists including *tagari* shoulder bags and the fluffy wool rugs known as *flokati*. Greece has several textile factories, but textiles are not an important industry for the country.

Today few Greek women spin or weave, although the love of textile crafts remains. On a warm summer night the visitor to Greece can see women sitting outside their homes crocheting, knitting, or tatting – continuing the long tradition of textile handwork.

Thasos

Island in the north Aegean

Thasos is the most northerly of all the Aegean islands, lying only some 7 km from the Thracian coastline of northern Greece, where the mouth of the Nestos river forms a low promontory. Its ties with the mainland were always close, and it is today governed from the port town of Kavalla. The mountainous interior of Thasos, rising to more than 1100 m, is thickly wooded, and the whole island has an area of just under 400 sq km. Its rich endowment with mineral wealth has been a source of contention throughout its history: from its mines of gold, silver, and marble that were particularly famous in antiquity, to the substantial installation of a German mineral mining and exporting complex at Limenaria still in operation after World War II, to offshore oil deposits discovered in 1974, the natural mineral endowments of the island have shaped its history.

Both Herodotus (6. 47) and Pausanias (5. 25) claimed that the first people to occupy Thasos were Phoenicians, traditionally led by Thasos, son of Poseidon, but archaeological

Thasos: fishing boats are still being built to traditional patterns on Thasos

evidence has not supported this, and Parian settlers were in occupation by the early 7th century BC. The wealth that they accumulated, deriving from the island's gold mines, was the cause of the island twice being attacked during the 5th century BC, by a tyrant of Miletus and, in 463 BC, by Athens. Herodotus wrote that he had seen the mines "where a huge mountain has been overturned in the search for *metalla*". In 340 BC Philip II of Macedon occupied Thasos, and it remained in Macedonian hands until the Romans took over the island in 196 BC.

Thasos was the birthplace of several personalities of cultural importance in antiquity: the 8th- to 7th-century BC poet Archilochus was among the colonists from Paros; the 5th-century BC rhapsodist and historian Stesimbrotus was a native of the island, as was also the famous athlete Theogenes. But the most famous of all the natives of Thasos was Polygnotus, who was to be numbered among the most distinguished of all Classical Greek painters. Pliny (*Naturalis Historia*, 35. 58) described how he was the first artist to "represent the mouth as open, showing the teeth, and relaxing the rigidity which had been usual before", and he also introduced the painting of women in transparent drapery. Descriptions of his paintings, by Pausanias and other writers, which could be seen all over the Greek world, provide ample evidence of his fame.

The extent of early Christian remains on Thasos demonstrates continuing prosperity well into the 6th century AD. There are the substantial remains of five basilicas in or near the main town of Thasos, and even more impressive are the two adjacent basilicas at Alyki on the south coast; an Archaic sanctuary has been excavated nearby, and the quarries that supplied the marble for these three structures are close at hand.

Thasos passes almost completely unmentioned by Byzantine historians; although Procopius tells of the Vandals under Genseric ravaging the mainland and nearby islands in 467–68, this island is not named; it was just off Thasos that in 829 an Arab fleet from Crete completely defeated the Byzantine navy, but the island itself played no part. Later, under Byzantine administration, it was allocated to the Thracian theme, and so was identified (as was the case with other islands situated closer to the mainland than to other island groupings) with a mainland authority. This absence of any particular identity continued after the Fourth Crusade, when even the Venetians decided that Thasos was too remote from the Cyclades to be of interest to them, and later in the 13th century its port was used by the Byzantines as a naval base for their operations against the Latin invaders. The Genoese presence later became too powerful in the north Aegean, and from 1307 to 1313 Tedisio, of the Zaccaria family, was in control. Although the island was recovered by the Byzantines, its bishopric being raised to metropolitan status, by 1434 the Gattilusi were in overall control. It would have been under this family that the Classical acropolis above the town of Thasos was partly rebuilt and

adapted to form a coastal fortress for the Genoese that overlooked the harbour. They also built a small inland castle in the centre of the island, installing a member of the Grimaldi family as the local captain at the village which is still called Kastro.

Succumbing to Ottoman rule in 1455, the following year Thasos was occupied, like the other north Aegean islands of Lemnos and Samothrace, by a papal force under cardinal Lodovico Trevisan. It was retaken for sultan Mehmet II three years later, and until 1470 he generously made all three islands over to Dimitrios Palaiologos, the dispossessed Byzantine despot of the Morea. Thereafter Turkish control continued until 1760, when the sultan Mahmud II ceded it to the family of the Egyptian pasha Mohammed Ali; in this way Thasos became unique among the Greek islands in having the status, from 1813 to 1920, of an appanage of Egypt, and even having its own president. During World War I it was occupied by the Allies, and in 1941 by the Bulgarians.

Just as its mineral riches were the cause of the island's first colonization, and of its being coveted by other powers at different periods, so its oil deposits in commercial quantities must ensure its importance in the contemporary Hellenic world.

PAUL HETHERINGTON

Summary

The most northerly island in the Aegean, Thasos is only 7 km from the coast of Thrace. Its mineral deposits (gold, silver, marble) made the island sought-after throughout history, and today oil is being extracted in commercial quantities. It was the birthplace of Polygnotus. Ceded to Mohammed Ali of Egypt in 1760, Thasos was an appanage of Egypt from 1813 to 1920.

Theatres

The rituals of Classical Greek religion involved, above all, the observation by worshippers of actions performed for the gods. In addition to the crucial sacrifices at an altar, there were athletic activities, and the singing and dancing of choral odes, normally as part of a contest. Evidence for this survives from a wide variety of city states; even at Sparta choruses of young maidens danced and sang odes composed for them by poets of the highest calibre, a marked contrast to the superficially dour impression that is attached to that state. The area in which this activity took place formed part of the sanctuary of the god to whom it was dedicated, and in most instances no more was required than a space, usually circular, on which the dancers could perform their movements of turn and counterturn, and round about this, space from which the spectator-worshippers could observe the ritual.

It was out of this that the Greek theatre developed. Drama formed an elaboration of the choral ode, by the separating out of individual characters, performed by actors, from the body of the chorus. This did not happen in all the city states, and is most clearly associated with Athens; the plays whose texts survive were all written for performance at the religious dramatic festivals of Dionysus there. Nevertheless theatres form an extensive and widespread category of building, whatever precisely the type of production that took place in them. The form, however, is best understood in relation to the development of drama as we perceive it from the Athenian examples.

The principal theatre of Classical Athens is situated on the south side of the Acropolis, in the sanctuary dedicated to Dionysus. The circular dancing floor for the chorus was placed between the small temple and the lower slopes of the Acropolis itself, which provide a most suitable area for viewing. The architectural elaboration of this into a developed theatre was protracted in time, and the earliest phases are inextricably obscured by the later, more permanent forms. Though the chorus remained an essential element in 5th-century BC drama, the separating out of actors would have required a distinct area for their performance, which we know took place in front of a structure that provided the setting. Much later accounts (in Vitruvius) talk of actual scenery and scene painting, but this may be something of an anachronism. There are, however, ample references to what are translated as stage buildings, the *skenai*, which may at first have been temporary. In the front of this (usually referred to by the Latin *scenae frons*) were doors through which actors emerged or disappeared. The convention seems to have been a single, central door for tragedy (which might serve, for example, as the palace of Agamemnon or the cave of Polyphemus), and probably three doors for comedy. These gave on to a stage, the height of which above the level of the dancing floor (the orchestra), failing the survival of material evidence from the 5th century BC, is perennially disputed by modern scholars. Actors, particularly those taking the role of messengers, could also come on to the stage from either side without going through the stage building. Within that structure there was provision for ancillary apparatus, particularly the "machine" (*mechane*) used for the sudden appearance of deities (hence the "god from the machine", the *deus ex machina*) which often brought to an end the otherwise insoluble dilemmas created in the plays of Euripides. In Athens in the 5th century BC the auditorium was provided with wooden seating, presumably removable, which seems to have been arranged in a polygonal rather than curved plan.

Everything became more durable in the 4th century BC. The size of the auditorium was enhanced by extensions from the natural slope on terraces supported by massive end walls. Permanent stone seating was placed on this, a development attributed to the statesman Lycurgus, in 346 BC, and the stage building was also translated into stone. This general arrangement is now found in other places, and culminates in the construction of the great theatre at Epidaurus. This was begun, probably, in the 330s BC, though development was slow, and work was still being carried out in the following century. There is a large circular orchestra, with a stage building behind, the

Theatre of Dionysus, the principal theatre of Classical Athens

details of which unfortunately are lost, only the foundations surviving. The seating is on a natural hillside, extended out with terraces on support walls and in plan occupying more than a semicircle. The rows of seats are divided into "wedges" by stairs. Twelve wedges form a semicircle, with a further wedge each side to the terrace walls. There is a middle walkway dividing the seating into lower and upper sections, the upper being possibly an addition to the original plan; here each wedge is further subdivided by an additional stairway, but with only a half-wedge beyond the semicircle. The resulting acoustic qualities are superb, as can be attested in modern performances, although such qualities are more a natural consequence of the layout than the result of deliberate planning. Though small roofed auditoria (*odeia*) were built specifically for musical performances, theatres remained essentially open-air, and so could accommodate large numbers. Epidaurus holds more than 10,000, and this is not unusual. Some later theatres, such as those at Ephesus, Miletus, and Pergamum, are even larger.

There is an interesting theatre of *c.*300 BC at Sicyon, where access to the auditorium was facilitated by two tunnels under the upper section of seating, leading to the walkway dividing the upper from the lower area. These were roofed with tunnel vaults, indicating a Macedonian design and the work of Demetrius Poliorcetes, who ruled over a reduced kingdom here following the defeat and death of his father at the Battle of Ipsus in 301 BC. In Macedon itself there had been a theatre a century earlier, for king Archelaus, who had enticed Euripides to his court, but the surviving theatre at Aegae has only the lowest row of seats in stone, the remainder being wooden on an earth bank. This was the scene of the great wedding procession in which Philip II was murdered. This procession demonstrates how theatres were used for activities that were not, in themselves, dramatic in character. Theatres also served as meeting places for political assemblies, and there is evidence for such use even at the theatre of Dionysus in Athens.

The best-preserved stage building is that of the theatre at Priene in Ionia, which is probably 2nd century BC in date. The stage platform is raised high above the orchestra level, and has in front a row of engaged Doric half-columns, with openings between. Behind the stage the *skene* rose for another storey, with the traditional doorways. Such a stage separated the actors from the chorus, and presumably reflects a decline in the importance of the chorus, which can be seen clearly in the Athenian comedies by Menander of the late 4th century BC. Even so, as well as these plays, the Athenian drama of the 5th century BC was still performed; a guild of professional actors, the "tradesmen of Dionysus", based in the Ionian city of Teos, seems to have gone on tour with such productions, and every self-respecting Greek city now required a theatre for them.

This continued after the Greek cities were assimilated into the Roman empire. It is possible to distinguish Greek from Roman theatres by the later truncation of the auditorium to a strict semicircle, and linking its ends to a high *scaenae frons*, usually with two or three storeys of attached columnar decoration framing the traditional three doors. Such theatres were

built in Rome itself and the western provinces, but those in the Greek areas usually kept enough space for the choruses, even if one suspects that they were not always used solely for revivals of classical drama. But the distinction is primarily a chronological one, and the semicircular plan was evolving already in late Hellenistic theatres. Improved Roman construction methods, particularly vaulting techniques, made it simpler to build theatres on flat ground, though if a suitable hillside was available it would be used; even in the 4th century BC Greek architects could build auditoria with seats resting entirely on artificial terraces, as at Mantinea and Eretria.

By the time of the Roman empire the religious significance of the theatres had largely passed. In the troubled times of the late empire theatres were often incorporated, by virtue of their massiveness, into fortifications. In Byzantine times plays were still written, but as literary exercises, rather than for performance. Theatrical performances in the Greek world continued only with the travelling players who still entertained in villages even in the early years of the 20th century, though without dedicated buildings. The new theatres of independent Greece, like the splendid example at Piraeus, were based rather on western and specifically Italian models.

Thebes

City in Boeotia

Thebes was the capital of Boeotia, set in its eastern basin with an area of some 12,400 sq km. Centrally located within this basin, Thebes commands the large, fertile Aonian plain to the north, and is near the Asopus valley to the south. The Teneric plain lies only some 7 km to the west. The area is also blessed with ample springs, rivulets, and rivers. Hence Thebes controlled a large, cohesive area of rich, arable land, which meant that it could easily extend its power throughout Boeotia. The city also enjoyed access to the Aegean by way of Aulis. Thebes itself was likewise endowed with a constant, dependable supply of good water. The acropolis of Thebes was the Cadmea, a plateau that rises gently from north to south, reaching a height of 63 m. It has always been the principal site of inhabitation.

Thebes did not become a major city until the Mycenaean period (*c.*1600–1250 BC). Archaeology has revealed two palaces, other buildings, and walls pierced by the famous seven gates of Thebes. The Mycenaean city appears early in the realm of Greek legend. Some ancient traditions attribute its founding to the Phoenician Cadmus, but other legends tell of founders who preceded him. No modern evidence supports the Cadmus legend: even though Cadmus gave his name to the citadel, the settlement was purely Greek.

Thebes entered the historical era in the Archaic period (*c.*600–500 BC). The city grew until it spread its influence abroad in Boeotia. By the middle of the 6th century BC it had helped to forge a loose confederation that was originally a religious amphictyony, marked by a festival in honour of Poseidon. The confederacy gradually served as the inspiration for political unity, and as such its members repulsed a Thessalian attack around 520 BC. Succeeding it was a rejuvenated league that came into conflict with Athens, an enmity that became traditional. These events show a clear and growing Theban policy that sought to strengthen the confederacy and to oppose Athenian ambitions in the region.

The bleakest moment in Theban history occurred when the city sided with the invader during the Persian Wars. Although in 480 BC Thebes defended Thermopylae against the Persians, the other Greeks suspected it of harbouring Persian sympathies. Abandoned by its allies after the loss of Thermopylae, Thebes fought with the Persians against the Greeks at Plataea in 479 BC. Thereafter, Thebes was branded as a traitor to the Greek cause. Following the Greek victory, it fell to a successful siege, but the rest of Boeotia was spared. The aftermath of the defeat was an eclipse of Theban power and authority. The confederacy survived, but only in 457 BC did Sparta strengthen Thebes by making an alliance with it, reaffirming its hegemony of the confederacy, and enlarging its circuit wall. Seeing these developments as a threat, Athens immediately attacked Boeotia, only to be repulsed by Sparta and Thebes at Tanagra. Later that year Athens struck again, routed Thebes at the battle of Oenophyta, and overran Boeotia. The unpopularity of Athenian rule prompted a successful rebellion in 447 BC that resulted in a Boeotian victory at the Battle of Coronea and the expulsion of the enemy from Boeotia. The victory led the major cities of Boeotia to create a new confederacy that conducted all federal business. It was the most innovative, comprehensive, and successful federal government of the Classical period, and helped to make Boeotia a major power in Greece.

Thebes played a disreputable role at the outbreak of the Peloponnesian War, attacking Plataea before the formal beginning of hostilites. Ally and enemy alike considered Thebes guilty of having violated the yet unbroken peace. Nevertheless, in 424 BC Thebes defeated a major Athenian army at the Battle of Delium, and afterwards contributed significantly to the ultimate defeat of Athens. Victory in 404 BC brought the submission of Athens and strife with Sparta: Sparta insisted on a hard but fair peace with the vanquished; Thebes, on the contrary, demanded the complete destruction of Athens. It also unsuccessfully demanded from Sparta a tenth part of the spoils of war. Thebes thenceforth displayed coldness to Sparta and

warmth to Athens. Antagonism gave way to open hostilities during the Corinthian War (395–386 BC). With the encouragement of the Persians, Thebes banded together with Athens, Argos, and Corinth to overthrow Spartan power in Greece. Fighting was at first fierce, with Thebes and its allies defeating Sparta at the Battles of Haliartus (395 BC) and Coronea (394 BC) and holding their own at the Battle of the Nemea River (394 BC). The war thereafter dragged on until Sparta, with vast Persian support, forced its enemies to accept peace. The King's Peace of 386 BC dismantled the Boeotian Confederacy and weakened Thebes.

Not content with humbling Thebes, Sparta sought to enfeeble it. In 382 BC a Spartan army seized Thebes in time of peace, and held it with a garrison. After four years of military occupation the Thebans overthrew the Spartans and rebuilt the confederacy. In 371 BC Thebes, under its two brilliant generals Epaminondas and Pelopidas, annihilated the Spartan army at Leuctra, thus inaugurating the era of the Theban hegemony, a decade when Thebes stood at the pinnacle of Greek politics. During that time it destroyed Sparta as a major power, frequently invaded the Peloponnese, and spread its influence northwards to Thessaly and Macedonia. In 366 BC Thebes won the friendship of the Persian empire. After a fruitless attempt to win naval superiority, Epaminondas made one last effort to reassert control over an unruly Peloponnese, but failed. At the battle of Mantinea in 362 BC Thebes won the victory but lost Epaminondas. That victory, ironically, ended the hegemony.

If the years after the Theban hegemony were anticlimatic, they were nonetheless eventful. In 355 BC Thebes came to the defence of the sanctuary of Pythian Apollo at Delphi. Seized by a band of Phocians whom the Amphictyons had found guilty of sacrilege, the shrine was militarily occupied and systematically plundered. Thebes and many other Amphictyons struggled to liberate Delphi from the Phocian temple robbers in a conflict known as the Sacred War (355–346 BC). Exhausted after years of unavailing warfare, Thebes and Thessaly turned to Philip II, king of Macedon, for succour. Together with the Amphictyons, Philip freed Delphi in 346 BC. His triumph propelled him to prominence throughout the Greek world, on the heels of which came a conflict with Athens that drew him further south to confront his enemy. Thebes and a few other Greek states now saw Philip as a threat to Greek freedom. In 338 BC Thebes, Athens, and some other allies suffered disaster at the Battle of Chaeronea. In its heroic resistance to this threat from the north, Thebes redeemed itself for having earlier sided with the Persians.

Chaeronea marked the end of Thebes' greatest days. In their place came a long period of twilight. Under the Macedonian kings it was generally at the mercy of greater powers. In 335 BC Alexander the Great punished a rebellious Thebes by utterly destroying it. Rebuilt in 316 BC by the Macedonian king Cassander, the city fell to Demetrius Poliorcetes in 290 BC. From 315 to 86 BC the fortunes of the city changed with those of Hellenistic and Roman commanders. Thebes and Boeotia alike suffered years of decline and decadence. The worst came in 86 BC, when the Roman Sulla reduced it to little more than a village.

Under the Roman emperors Thebes enjoyed renewed material prosperity. Its spiritual inspiration came with the espousal of Christianity, and its first bishop, Rufos (AD 81–96), was also its first martyr. Thebes was reputedly the burial site of the evangelist Luke, and in AD 325 it became an established bishopric. Devastated by Alaric the Goth in AD 397 and levelled by an earthquake in 551, it was rebuilt by Justinian. Thereafter it became economically important because of its voluminous industry in silk and purple dye, which not even the plundering of the Norman king Roger II totally ruined. In 1205 Thebes became the capital of the Duchy of Athens. The Turks, becoming predominant by 1447, reduced Thebes to insignificance. In 1829 Demetrios Ypsilantis besieged it. Again rebuilt after the earthquakes of 1853 and 1893, the city grew in 1923 owing to the influx of Greeks from Anatolia. Today Thebes is most prominent as a market city, but bauxite works have also grown on its outskirts.

Thebes has left a rich legacy. From the realm of legend come Heracles, Cadmus, Oedipus, the cycle of the Seven against Thebes, Antigone, and Tiresias. Indeed, Athenian drama would have been much the poorer without the seven-gated city. Pindar and Corinna wrote exquisite poetry, and Pindar's sophisticated verses are masterpieces of metre, variety, and content. In the Middle Ages Thebes became a steadfast seat of Chrstianity, a fundamental ingredient in the heritage of modern Greece and the world at large.

Summary

The capital of Boeotia, Thebes was an important city in the Mycenaean period and also in Greek legend. For much of the Archaic and Classical periods it was the head of a Boeotian confederacy. It fought alongside the invader in the Persian Wars. Defeated by Sparta in 386 BC, Thebes had its revenge at Leuctra (371 BC) and for ten years enjoyed hegemony over Greece. Defeated by Philip II of Macedon at Chaeronea (338 BC), Thebes went into decline. Famous for its silk industry in the Middle Ages, it was capital of the Duchy of Athens after 1205.

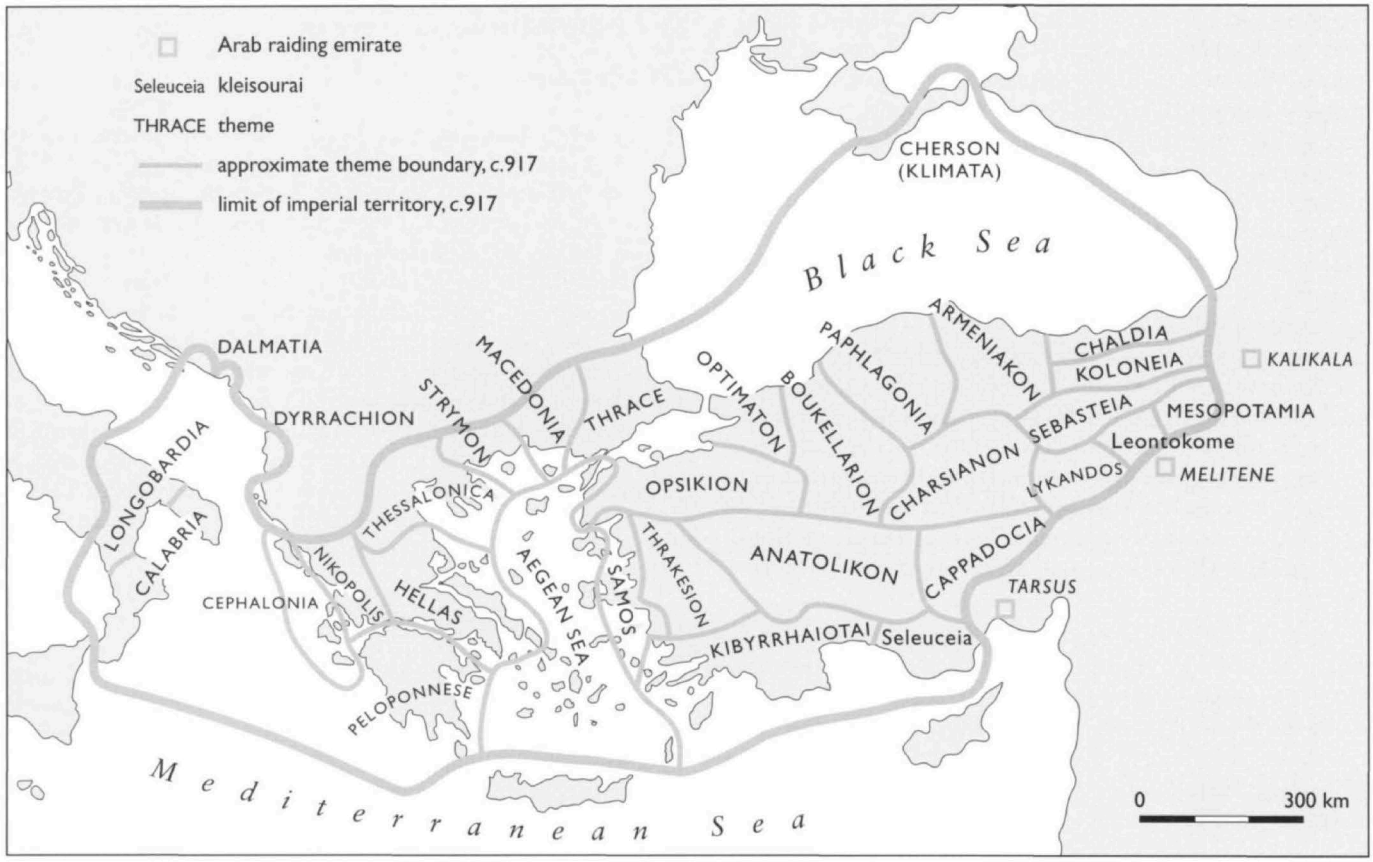
Theme System

Themes were primary divisions of the armed forces, provincial administration, and land or sea territory in the Byzantine empire. As a concept of government they had a remarkable



44. Themes of the Byzantine empire *c.*917

lifespan, from around AD 600 to 1300, although towards the end of this period they were mostly abandoned in practice. Their complex history remains controversial in many respects, but they did acquire a systematic character that reflected both the organizational strengths and individual weaknesses of Byzantine leadership. On the whole, they played a major role in stabilizing the empire, and in enabling it to shield Europe from eastern aggressors, especially the Arab Muslims.

The first Byzantine rulers, striving to protect borders against barbarians from every direction, gradually found that the traditional Roman emphasis on a civil administration with centralized armies was no longer the most effective way to maintain soldiers and defend exposed regions. An improvement was made by the emperor Maurice who, late in the 6th century, subordinated civil to military authority in the Exarchate of Ravenna and imposed a similar regime at Carthage. This measure was not yet extended to other areas that it might have saved, notably continental Greece in the face of Slav invasions. But soon Maurice's successors, from Herakleios (610–41) to Leo III (716–41) , reconquered Asia Minor and began settling troops there, more or less permanently and independently prepared for war.

Men who gained a hereditary right to land that could support them in peacetime were thus expected not only to fight when needed, but to do so at best in defence of their own homes, and to demand little payment from the capital. Such reasoning was not unprecedented, as citizen farmers had been the core of armies a thousand years earlier both in the majority of classical Greek city states and the Roman republic. What distinguished the Byzantine approach was its elaboration, flexibility, martial-law institutions, and focus on survival rather than expansion. It also stimulated local economic life, and agreed with a fundamental tendency in this multiethnic society to feel regional solidarity as opposed to national identity. In some ways anticipating a modern collective security alliance such as NATO, it turned the empire's military efforts into a many-headed monster that often had nothing to fear but changes of heart in Constantinople.

Each province was termed a theme due to the resident army corps (*thema*) and could be named for its particular corps. Its governor, appointed by the emperor, was the corps commander (*strategos*). Beneath him, an intricate hierarchy of officers (chiefly entitled, in ascending order, *droungarios*, *tourmarchis*, and *komis* or count) was responsible for corresponding subdivisions of the theme. *Kleisoura*, meanwhile, was the name given to some frontier districts of the empire, of lesser status than the themes. Themes were not static units with rigid borders, and while the forces in Anatolia usually had greatest importance, further themes were created continually. From a few in the mid-7th century, they proliferated as far as Italy and the Caucasus, numbering nearly 40 before the Crusades. Concurrently they spread to the surrounding waters: in a versatile navy including imperial, local, and thematic fleets, the last were the most autonomous and covered a vast range of east Mediterranean and Black Sea coasts. Maritime themes, led by admirals instead of generals, resembled the terrestrial ones in management, but were based upon many supply ports or islands.

The control and development of themes varied as much as their topography. For example, their very existence invited mutual discord and they occasionally attacked each other or revolted against the emperor. Since the western and maritime themes were more rooted in Graeco-Roman culture than those of the east, the system also worsened relations between the navy and army, contributing to conflicts such as that of 8th-century iconoclasm. Nor did it bridge the social gap between city and countryside. In Greece the key areas came to comprise a single theme of Hellas and the Peloponnese, governed from Thebes or Athens, with self-supporting administrators who collected revenues rapaciously, adding to a burden of imperial taxation. Yet thematic organization helped to recolonize the Aegean in the wake of the Slavs, and persisted in dreams of its rescue from the crusaders. As late as 1300 the historian Pachymeres seemingly imagined that a district somewhere in Laconia had been surrendered by the Franks and still belonged to the old theme or might become a new one, though the place stayed in Slavic hands according to the *Chronicle of the Morea*.

Already at the turn of the millennium, however, success began to spoil the Byzantines and two contrary processes began the decline of the themes. First, the sprawling empire was consolidated by recentralizing authority in a refined, antimilitaristic bureaucracy that neglected the regional defences, promoting civil ministries and local judges (*krites*). Second, its resources were being fragmented through feudalization, eventually under western influence: officials and churches amassed huge estates, while freeholding soldiers and sailors sold out. The 11th- and 12th-century emperors favoured direct systems that gave command to dukes or domestics (*domestikoi*, "commanders"), bought the loyalty of potentates and troops with grants of land or produce (*pronoia*), and defined the provinces differently, reducing "themes" to a vague geographic and fiscal term.

Thus, again like their ancient predecessors, and despite correctives by some Komnene and Palaiologan rulers, the themes largely succumbed to the rise of aristocrats competing at the expense of the peasantry, who increasingly merged with the urban proletariat and were replaced on the battlefield with costly, unreliable mercenaries. All this was soon proved unwise by the Turkish invasions, which can be seen as a legacy in default of the theme system.

Themistius *c.*AD 317–*c.*388

Philosopher

Like his father, his first father-in-law, and a grandfather, Themistius was a philosopher, and throughout his life he continued to regard philosophy as his chief calling. Perhaps born in Paphlagonia like his father, he was made a member of the senate of Constantinople in 355 by the emperor Constantius II, son of Constantine. From that time on, he was very active in public affairs. In the late 350s he played an important role in recruiting new senators for what was fast becoming the "eastern capital" and almost certainly held the high urban office of proconsul of Constantinople. His rise to prominence in the senate was rapid; he served as a spokesman for the city and its aristocracy and frequently represented them abroad. Office came to him again in the mid 380s, when he assumed the urban prefecture, which had replaced the Constantinopolitan proconsulship in 359. He died soon after holding this office.

In addition to serving Constantinople and its senate, Themistius was a panegyrist and adviser of emperors. He gave the usual general advice of the philosopher on how to govern well. On specific issues a reconciling tone prevails. A flexible pagan who worked well with Christian emperors, he urged the pagan emperor Julian (361–63) not to persecute Christians and later tried to moderate the Arian emperor Valens' persecution of Nicene Christians. He encouraged emperors to show clemency to their domestic foes. The Goths, who were threatening the Roman empire in the north under Valens (364–78) and Theodosius (379–95), should, in Themistius' view, be offered peace and admission into the empire. Themistius' influence at court was probably strongest in the late 350s under Constantius and in the 380s under Theodosius. Ironically, he may have been somewhat marginalized under his fellow pagan Julian. The two men had disagreed on certain issues of political philosophy, as Julian's *Letter to Themistius* reveals, and Themistius could not have been comfortable with Julian's religious fanaticism. Themistius' closeness to Constantius, against whom Julian revolted, may have caused an initial awkwardness. And it is hard to imagine the irenic Themistius approving of Julian's military campaign against the Persians.

Before he became involved in public affairs in 355, Themistius devoted all his time to the pursuit and teaching of philosophy. Although he was open to a variety of philosophical influences, he regarded himself mainly as a follower of Aristotle. His so-called *Paraphrases* or explications of Aristotelian works were a project of his early career. Some of the *Paraphrases* have not survived; but we do have those on Aristotle's *Analytica Posteriora*, the *Physica*, and the *De Anima* in Greek and those on the *De Caelo*, *Metaphysica* book 12, and the *Analytica Priora* (excerpts only) in Arabic and especially in Hebrew. Most if not all of these commentaries were completed before 355. After 355 public affairs as well as philosophy would have a claim on Themistius' time.

In his *Oration* 23 Themistius says that his *Paraphrases* attempted nothing more than to clarify Aristotle's words, have nothing new in them, and were never intended for publication. He was being excessively modest. The *Paraphrases* were cited by subsequent Greek Aristotelian commentators, from

Ammonius in the 5th and 6th centuries to Eustratios of Nicaea in the 11th and 12th centuries. According to his modern editor G. Vitelli, John Philoponus (6th century) in his commentary on Aristotle's *Physica* not only explicitly cited Themistius' commentary on the same work some 15 times, but also tacitly drew from it 600 times!

We have, in addition to the Aristotelian commentaries, a collection of Themistius' orations. Thirty-three have survived in Greek and, along with them, an oration in Latin that has been proved to be a forgery of the 16th century. We also have a Themistian work on virtue that survives only in Syriac and a work, addressed to Julian, on governing the state that survives only in Arabic; these may also be orations. The Greek orations have traditionally been divided into "public" or "official" (*politikoi*) addresses (1–29 minus the spurious Latin *Oration* 12) and "private" ones (20–34). It is in the public orations that one finds Themistius praising and advising emperors. These orations make it clear that, for Themistius, the central imperial virtue is *philanthropia*, the benevolence of which the emperor is uniquely capable and through which he becomes like God. The private orations consist of apologetics, cultural (i.e. rhetorical and philosophical) programmatics, material of autobiographical interest, and philosophical discourses. In these orations Themistius argues, against his critics, that the philosopher should be involved in public affairs. He also argues that the lessons of philosophy should be broadcast, in an appropriate form, to the masses, not reserved for a few select pupils. Holding this view, he was in disagreement with the contemporary Neoplatonist circles to which Julian was drawn; in these circles esoteric learning was shared with an elite corps of disciples. It was rhetorical skill, Themistius contended, that allowed the philosopher to present his teachings to the general public in an attractive and persuasive manner. The philosopher's use of rhetoric was not "sophistical", not merely for show, pleasure, or gain.

The Byzantines admired Themistius' orations. They belong to the long tradition of classicizing Greek oratory in the Roman empire that produced Dio Chrysostom and Aelius Aristides in the 1st and 2nd centuries AD, included Themistius' contemporaries Julian and Himerius, and had its final florescence in late antiquity in the so-called school of Gaza.

Themistocles *c.*525–459 BC

Athenian statesman

Themistocles first appears in our sources as archon of Athens for 493/92 BC, when he began fortifying the Piraeus, as a much superior replacement for Athens' former harbour at Phaleron. This first appearance exemplifies the central preoccupation of his career, that Athens should become a great naval power. It also exemplifies the legendary intelligence that all the sources emphasize. Similarly, in 483 BC, when a rich seam of silver was discovered at Laurium, he urged that it be used not for the short-term individual gain of the citizens, but to augment the Athenian fleet, which then numbered only 50, but would number 180 at Salamis. Whether Athens' ongoing dispute with Aegina or rumours of a Persian invasion were his focus, his policy was directly responsible both for Greece's unexpected victory against Persia and the thalassocracy on which the Athenian empire was based.

The climax of Themistocles' Greek career was his performance as commander of the Greek fleet at Salamis in 480 BC. Aeschylus himself fought at this battle, and his *Persians* and Herodotus are our most contemporary sources for what happened. Though there are different emphases in each, they agree that Themistocles forced the battle – in Herodotus, against the will of the Peloponnesians – by sending word to Xerxes that the Greeks were planning to retreat by night: Xerxes blocked off the escape routes and the Greeks and Persians were forced to fight. Themistocles' motives and the exact details of what happened are disputed, but his plan enabled the Greeks to fight in narrow waters, which were advantageous to them, but detrimental to the Persians, because of their superior numbers. It was widely acknowledged in Athens that the Battle of Salamis was decisive in saving Greece, and in Simonides' poem on the battle Themistocles' wisdom was especially praised. A sanctuary of Artemis and a trophy for the victory on Salamis were discovered in the 19th century, though little is visible today.

Themistocles foresaw that Athens' new prestige and power would eventually damage its relations with Sparta. When the Athenians began to rebuild their ruined city, and the Spartans suggested that refortification was unnecessary, Themistocles

Themistocles: marble portrait bust, Museo Ostia, Italy

outmanoeuvred them as he had outmanoeuvred Xerxes. Ordering the Athenians to finish the rebuilding as quickly as possible, he went to Sparta, allegedly to discuss the issue there. By delaying and making excuses, he kept Sparta uncertain of what was happening in Athens until it was too late and the fortifications were established: Athens' credit was too good in Greece for the Spartans to complain openly, but they were not pleased, and this is an early sign of the tensions that would ultimately lead to the Peloponnesian War.

In the spring of 478 BC Themistocles returned to the fortification of the Piraeus that he had begun in his archonship. Although events ultimately proved the wisdom of his plan, in the short term the decision worked against him. While Cimon and Aristides pursued glamorous foreign campaigns of revenge against Persia, Themistocles presided over the valuable but dreary and exhausting work of fortification at home. His desire for continuous expressions of gratitude for his services at Salamis also harmed him among the people, who became resentful, especially when he constructed a temple of Artemis of the Best Advice (Aristoboule) which contained his own statue. One of his supporters, however, may have been Aeschylus, whose *Persians*, performed in 472 BC, is sometimes interpreted as an attempt to remind Athens of Themistocles' services at a time when he was unpopular, although only a few lines concern him and he is never actually named. At any rate, Aeschylus was not enough to save him and, perhaps in 471 BC, he was ostracized. In fact, ostraca dating back to the mid-480s BC indicate that he had always had many enemies, and it is surprising that he had managed to avoid ostracism for so long.

He went to Argos, and it may be significant that Elis and Mantinea acquired democratic governments at this time. If he was stirring up democratic anti-Spartan feeling in the Peloponnese, it is not surprising that the Spartans wanted his removal. An opportunity presented itself when they put to death their own general Pausanias under suspicion of treason with Persia. Letters were allegedly found that implicated Themistocles, but before he could be arrested, he fled to Corfu. A strongly romanticizing strain, which seduced even Thucydides, colours the rest of his story: it probably derives from Themistocles himself and his descendants. Thucydides tells a stirring tale of hair's breadth escapes from capture, as Themistocles' ship was carried by a storm straight into the Athenian fleet besieging Naxos, until he finally landed in Persia, where he seems to have lived a life of obscurity for several years before approaching the Persian king. The dating for this part of his career is uncertain, for the obvious reason that his actions had to be so clandestine.

Later accounts describe his meeting with Xerxes' successor Artaxerxes, in which he won him over. Themistocles reminded the king that he had persuaded the Greeks not to break the bridges that had conveyed the Persians into Europe, thereby saving Xerxes. The story is told first in Herodotus, who interprets it – implausibly – as a sign that Themistocles was already planning to defect after Salamis, and the story may derive from Themistocles' own fertile imagination. Tradition recounts that he learned Persian in a year and became a friend and adviser to the king, who gave him control of several towns, including Magnesia. He settled there happily, keeping up with his origins by introducing Athenian festivals into Magnesia, and issuing his own coinage on the Attic standard, of which some examples are extant. Aristophanes already knew of a tradition in which Themistocles committed suicide by drinking bulls' blood when the king insisted that he should repay his kindness by leading an expedition against Greece: this too may come from Themistoclean sources, eager to erase any stain of disloyalty to Greece, and a natural death is more likely. For his descendants, honours were maintained in Magnesia even down to the time of Plutarch. It is likely that Themistocles' relatives eventually brought his body back to Athens: monuments to him in both Magnesia and Attica are recorded.

Though quite abundant, all accounts of Themistocles are shaped by the strong reactions, both positive and negative, that he elicited from his fellows. In Herodotus his greed and deception predominate, though his services to Greece are also acknowledged; for Aeschylus and Thucydides his "deceit" is cleverness, and Thucydides may deliberately have rehabilitated a man whose outstanding intelligence he regarded as equal only to that of Pericles. The life of Themistocles, with its exceptional triumphs and reverses, generated tremendous interest in later tradition. Some information on his life is historically valuable, though much is also of a purely anecdotal variety: strands of both types are clearly evident in Plutarch's *Life*. Because of his part in building the Athenian navy, he is regarded as Pericles' forerunner as a democrat, and sources tend to speak well or ill of him according to their judgements of democracy. Among philosophers, his character was a favourite test case on the relative roles of nature and nurture in creating intelligence, and rhetorical schools used incidents from his thrilling life as material for debates: these factors exacerbated the tendency for traditions to be embroidered even more as time went on, even to the extent of the forgery, probably in the late 1st or 2nd century AD, of 21 letters, allegedly written by Themistocles to friends from various stops along his escape route.

Summary

Born *c.*525 BC, Themistocles was archon at Athens in 493/92, when he began fortifying Piraeus. When silver was discovered at Laurium in 483, he urged that it be used to enlarge the fleet. In 480 he commanded the fleet at Salamis. Ostracized in *c.*471, he went to Argos and then Corfu; then he fled to Persia and settled at Magnesia. According to tradition he committed suicide in 459 BC.

Theocritus

Poet of the 3rd century BC

Theocritus lived and worked in the first half of the 3rd century BC. A native of Syracuse, he was probably also active in Cos and in Alexandria under Ptolemy II Philadelphus. This peripatetic poetic career may be considered as characteristic of a period in which old loyalties to individual cities were eroded under the larger governmental units that were their successors. Theocritus is typical of his time also in his movement away from the older literary forms native to the Greek polis, such as epic and drama, and for his preference instead for creating new combinations within traditional genres out of his intimate knowledge of the Greek literary heritage, and mixing "high" and "low" literary forms, to create new poetic blends designed to appeal to a highly sophisticated audience.

Theocritus is best known for bucolic poetry, whose setting is the countryside and whose subject matter is herdsmen, their animals, their loves, and above all their songs. The countryside is highly idealized: specific indications of places and times are generally ignored in favour of timeless scenes that emphasize the abundance and beauty of the countryside, the sensual pleasures of its colours, smells, and sights, and the leisurely lives of the herdsmen. Theocritus likes to contrast the world of nature and simplicity with a larger world of civilization beyond it. His herdsmen partake of both worlds, being simultaneously portrayed with amusement as representatives of rustic simplicity, yet also admired as artists and creators of exceptional poetry. Thus his portrayal of them is never consistent and somewhat detached, and the tone of the poems moves constantly between the realistic and the idealized. This shift is also reflected in their form and language. Theocritus writes in Doric, but not the Doric actually spoken by Sicilian herdsmen, but a stylized mixture of contemporary and poetic forms, and while an occasional bawdiness colours the poems to give some illusion of reality, mostly he prefers a formal elegance and motifs that look unceasingly to his great predecessors for their inspiration. Although superficially his thought seems straightforward, with only occasional ventures into symbolism or obscure myths, these poems of simple country life are as much a product of Alexandrian literary taste as the more obviously learned poetry of Theocritus' library-dwelling contemporary Callimachus.

The relation of Theocritus' bucolic poetry to contemporary practice in the countryside is unclear, but the repetitions and use of refrains that are such a notable stylistic feature in his poems are attested in other traditions of pastoral poetry. Furthermore, the singing contests of which he writes still exist – in a less self-consciously literary form – in modern-day Sicily, Crete, and Rhodes, and the capping of stanzas, the use of phonological and syntactical parallelisms, and the general spirit of display and mockery that Theocritus' herdsmen exhibit all feature in modern songs of this type. In ancient tradition there is also a consistent association of shepherds and herdsmen with music making, as is seen in the biographical traditions attached to Archilochus and Hesiod. Theocritus may possibly have been the first poet to make higher literature from traditions of popular song. If so, he is again typical of his time, since the high poetry of the Hellenistic age tended to rework elements from popular culture into new, literary modes.

Theocritus is best remembered for his poems of country life, largely because, via Virgil's adaptations of them in the *Eclogues*, they influenced later European pastoral poetry so strongly, but his extant corpus extends beyond these in subject matter, tone, and dialect. He addressed poems to the great men of the day, such as Hieron II of Syracuse, from whom he may, probably unsuccessfully, have hoped for patronage, and to Ptolemy II Philadelphus (who may have been more generous). Some poems are set in the city, such as poem 2, which is a monologue by a young woman using magic to retrieve her errant lover, and 15, a dramatic dialogue of two women in Alexandria and their day out at the festival of Adonis. The amusing realism of this poem and its interest in the lives of ordinary people reflect general tendencies in Hellenistic literature and art. These poems have an antecedent in the work of Sophron, a writer of mimes of the 5th century BC, a "low", but popular, genre of entertainment, and a parallel in the rather earthier mimes of Theocritus' contemporary Herodas.

Other poems are written in epic dialect, or in a mixture of epic and Doric, and Theocritus even seems to have imitated the Lesbian of Alcaeus and Sappho. Twenty-seven epigrams are preserved under his name, as is the novelty poem "Syrinx" written in the shape of panpipes. In his handling of epic themes, such as stories of Heracles and the Dioscuri, he shows the normal tendencies of this time to retell lesser-known stories in a domesticizing, small-scale style. His treatments of the myths of Heracles and Hylas and of the Dioscuri may be compared with those of Apollonius, which, by contrast, are in a more traditional epicizing mode. It would appear from these and other evidence that Theocritus was a devotee of Callimachus' small-scale aesthetic, rather than that of Apollonius.

At least one Theocritean poem, the *Berenice*, has not been preserved, while several poems transmitted in the Theocritean corpus are the work of later imitators. Little bucolic poetry between Theocritus and Virgil survives, but Moschus in the mid-2nd century BC and Bion, *c.*50 years later, show a strong Theocritean influence. The first ancient collection of Theocritus was gathered by Artemidorus of Tarsus (1st century BC), and from the writings of Lucian, Longus, and others it is clear that bucolic poetry remained popular in the next century. Our papyri range from the 1st to the 7th centuries AD. A maintenance or revival of interest in bucolic is evident in the 4th to 6th centuries in the poems of Quintus, Nonnus, Tryphiodorus, and epigrammatists, some Christian writers, and also in the numerous papyri datable to the 5th century AD. To the pastoral renaissance in the Greek world from the 12th century on we owe a large number of Theocritean manuscripts – nearly 180 in all – and Byzantine scholars such as Planudes, Moschopoulos, Triklinios, and probably Tzetzes all wrote commentaries on his poems.

Although Theocritus' secure place in the Byzantine canon has ensured that relatively substantial remains of his work have come down to us, the Byzantine enthusiasm for Attic Greek has wreaked havoc with Theocritus' Doric forms, and has caused problems for modern editors trying to restore his original language. Throughout the 15th century Byzantine manuscripts came to Italy and Theocritus was one of the first

Greek poets to be produced in printed form, in Milan *c.*1480. More people continued to read translations of Theocritus than the original, however, and he has been translated into many languages throughout Europe, including modern Greek. No other Greek author was as often and as successfully imitated as Theocritus, but his influence on western literature is primarily through Virgil whose Latin was more acccessible to many more people than Theocritus' Greek.

Theodora *c.*497–548

Empress and wife of Justinian I

Theodora grew up in an impoverished environment that contrasted sharply with the glamour and power of her adult life as empress and wife of the Byzantine emperor Justinian I. Her unprecedented power as Augusta and her deep influence over Justinian were bound to attract attention and mixed reactions from contemporary observers in an age when the political role of the empress was neither well received nor formally spelled out. Our main source on Theodora's early years as well as on her public life is the contemporary historian Procopius, whose *Wars* and *Buildings* attempt to be an official history of the reign of Justinian and Theodora, while his *Secret History* engages in an exhaustive and often vitriolic examination of Theodora's origins, morality, and private life. Procopius' work is valuable evidence of the reception of female political power in the early years of the Byzantine empire; however, its involved character makes a reliable reconstruction of Theodora's life particularly difficult, especially since no other contemporary source enlightens us much on the subject.

In Procopius' account of events, Theodora is presented as the daughter of Akakios, a bear keeper employed by the Greens in the Hippodrome in Constantinople, whose family was put under the protection of the Blues after his death. Procopius is not sparing with scurrilous descriptions of Theodora's allegedly profligate youth in the rough culture of the Hippodrome. Other sources, however, point at Paphlagonia as her birthplace and suggest that she made her way to Constantinople as a lowly spinner of wool. Reading between the lines of Procopius' account, we can be fairly sure that Theodora was a rather successful comic actress, a kind of courtesan with considerable popularity in the capital, as well as in Alexandria and Antioch, before her meeting with Justinian around 520 and her subsequent marriage to him in 525.

To make things appear more seemly Justinian persuaded his uncle, the emperor Justin, to confer upon Theodora the dignity of the patriciate. Additionally, a special edict had to be issued allowing senators to contract a legal marriage with actresses who had abandoned their former life. Both acts signify the highly unconventional character of Theodora's ascent on to the public stage, which in fact was bound to have far-reaching repercussions on the way that power was distributed and important decisions were made throughout Justinian's long reign, which began in 527 and ended with his death in 565.

The sources describe Theodora as a woman with remarkable compassion for the unprivileged, no doubt related to the destitution of her early life. This compassion triggered what should be seen as the first important social reform programme in the empire, involving welfare programmes for the poor, rehabilitation projects for former prostitutes, and endowment schemes for hospitals, orphanages, and schools. Her public role is, however, more difficult to ascertain.

Procopius draws our attention to Theodora's conspiratorial palace politics, which nevertheless appear rather unavoidable given that the political status of the Byzantine empress was never explicitly defined. He presents her as a forceful and domineering woman constantly meddling in state affairs and dominating an impressionable and weak-willed Justinian. Her most notable interventions were her fervent support of Monophysitism throughout her life, her outspoken and courageous attitude during the riot of Nika (11–19 January 532), her manipulative intervention in the rupture of the empire with the Ostrogoths in Italy in the early 530s, her involvement in the removal of pope Silverius (536–37), her hostile attitude to pope Vigilius (537–55), and her plotting against John of Cappadocia, a high-ranking official, which led to his deposition in 541.

In the light of the above, it is not surprising that Theodora's political role has always been deemed ambivalent. Modern historians have often pointed to her inability to grasp the main weaknesses and needs of the expanded but also fragile and

Theodora: mosaic of the empress in San Vitale, Ravenna, 6th century

rather loosely integrated Byzantine empire of the 6th century, and have held her accountable for letting her personal preferences and aversions interfere with judgements on sensitive matters of state. Charges of political ineptitude seem to apply, at least in certain cases, and one need not underestimate the fact that, having been catapulted into her royal position by marriage, Theodora, just like Irene in the 8th century and the second Theodora in the 9th century, was certainly never properly prepared for her imperial duties. On the other hand, reading between the lines of the contemporary hostile accounts, we perceive her as an exceptional individual with remarkable personal courage. We also realize that she was perhaps the first, most highly eccentric and vivid example of a small but not insignificant series of Byzantine imperial women who wielded considerable, even if often indirect, power, against the background of a highly militarized and largely male-dominated society that tacitly accepted but never felt at ease with the female influence exercised by the empresses. Theodora died in Constantinople on 28 June 548, perhaps of cancer, and was buried in the church of the Holy Apostles.

Theodora d. 867

Empress and saint

Born at Ebissa (Paphlagonia), the daughter of an Armenian in the service of the empire, Theodora married (either in 821 or in 830) the iconoclast emperor Theophilos, becoming regent at his death in 842. According to the chronicler, the loveliest girls in the empire had been brought to Constantinople for Theophilos to choose a bride: he chose Theodora. (The same is

told of half-a-dozen other empresses. Ryden, 1985, convincingly suggests that in each case the story is a "stylized" description of imperial weddings, popular for a time, rather than a realistic account.) Five daughters (Thekla, Anna, Anastasia, Pulcheria, Maria) and one son (Michael) were born of the marriage.

After Theophilos's death in 842 there is little doubt that a small number of men, of imperial blood or with other claims, envisaged bidding for the throne. Theodora relished power, and, as regent, she meant to keep it. Connected to her plans, but in what manner can only be conjectured, is the pardon of Theophilos. Was Theodora motivated by love for her dead husband or was she aware that the Church's curse on him for having prohibited the cult of icons, publicly renewed yearly, might be damaging for his son – and for the regent?

The different accounts of the "Restoration of Orthodoxy" (i.e. the cult of icons) are perhaps best understood as reflecting the positioning and the initial moves made by the parties in confrontation. Theodora relied on the civil service and certain elements of the Church, including holy men from the hills in considerable numbers, whose presence in Constantinople made any attempt to seize the throne far more risky, and took as a symbol of her assumption of power a change of religious policy, presented merely as a return to the former state, in fact imposing the contrary option as iconoclasm had never been imposed. At the same time the whole episcopate was changed.

Not all the sources mention the pardon of Theophilos, but the number of variants suggests that great importance was attached, not only to obtaining it, but also to having this known. As justification for it, in most sources, he is alleged to have repented and venerated images before his death, in the presence, according to one version, not only of Theodora. But in general Theodora is presented requesting the new patriarch, Methodios, and the new hierarchy – as she is granting them restoration of icons and showing them every possible favour – in return, to grant her, their sovereign, a favour: God's forgiveness, pardon, and amnesty for her husband for his sins with respect to images. "Your request is just", they reply. "It is right to repay benefactors and rulers freely, so let it be not a tyrant's hand that rules, but a God-fearing mind. But we cannot snatch from God's judgement one already departed to the other life. Those who died manifestly condemned, their guilt we cannot remove." The empress, "telling the truth or out of love for her husband", related on oath to the sacred assembly that he had abjured on his deathbed, and embraced icons that she had supplied; on the strength of this she asked for "a written forgiveness of his sin". They accept her story. In an alternative version the patriarch Methodios lays a list of heretics' names, including Theophilos's, on the altar, and he and all the Orthodox metropolitans, monks, and laymen pray earnestly. An angel appears to Methodios saying: "Your prayer has been heard, Theophilos is pardoned." When the list is checked, Theophilos's name, and his alone, has disappeared; all the other names are still on it. The historian Genesios makes Theodora bargain more crudely: "If this is not granted me, you will not find me on your side, nor will you obtain from me the restoration of icons, nor the direction of the Church."

However, the advantage of having witnesses is obvious – and not only for Theophilos. The principal witness apart from Theodora was Theoktistos, who had been Theophilos's right-hand man, and whom Theodora intended to keep as her principal collaborator and supporter. How fortunate that he was able to pull an image of the Virgin out from under his clothes for Theophilos to adore! So he had been a crypto-iconodule! It suited both Theoktistos and Theodora to propagate this image of him, and this may well have been the final official story, once everything was settled. Possibly the other stories reflect what happened more faithfully.

Theodora's investment in the bureaucracy and suspicious attitude towards generals enabled her to retain power but did not lead to success in war. She also made Theoktistos, her principal minister for home affairs, a general for campaigns; he seems to have been defeated more often than he was victorious, but remained in position till his murder was organized by Theodora's brother Bardas, assisted by Michael, in 856.

Bardas left the empire to Michael, and himself founded the College of the Magnaura (where the syllabus included philosophy, geometry, astronomy, and grammar, in a much broader sense than it has today). He was also active in the law courts, representing the emperor and reviving the tradition of justice being meted out by him. Theodora did not appreciate being set aside and participated in a plot against Michael. It was uncovered, the other leading participants were executed, and Theodora and her daughters were sent to a convent. Her relations with Michael seem, however, to have remained good, and the picture of her mourning over his corpse is surely at least figuratively true.

Theodora's canonization was purely political. There was no canonically defined process for achieving that state. Recognition by a sufficient number of people and, after death, having a hagiographer, or at this date having been father-superior of one of the more powerful monasteries, were in the Eastern Church the normal stepping stones to becoming a saint.

Theodorakis, Mikis 1925–

Composer

Mikis Theodorakis is not only the leading modern Greek composer of his generation, but an internationally acclaimed

artist who became a symbol of resistance to the 1967–1974 dictatorship in Greece. Outside his own country he is probably best known for his film scores for *Zorba the Greek*, *Z* , *State of Siege*, and *Serpico*. His popular songs, many of them settings of well-known poetry, inspired a generation of Greeks, many of whom shared the composer's left-wing political beliefs. In the 1960s Theodorakis established a new style of song that combined elements of low-class popular music with sophisticated poetry. Less well known but equally impressive are Theodorakis's achievements as a classical composer. From his first symphony, begun in a prison camp in 1948, to the trio of operas – *Medea*, *Electra*, *Antigone* – completed in 1996, Theodorakis has composed a large body of classical works, many of which have had successful performances in Europe. As a political figure Theodorakis has always been controversial. Persecuted and tortured, like so many Greeks of his generation, for his loyalty to the communist-led resistance during World War II, he was never a doctrinaire politician and even became, for a brief period in the early 1990s, a minister for the conservative New Democracy Party. Despite the unpopularity of many of his political decisions, Theodorakis remains a legendary figure in Greece, a hero to many, and a composer whose songs are familiar to an entire population.

Theodorakis's life has been shaped by the tumultuous events of his country's history. He was born in 1925 on the island of Chios, where his parents had fled following the burning of Smyrna in the Graeco-Turkish war of 1920–21. His father was a Cretan civil servant and loyal supporter of the anti-monarchist leader Eleftherios Venizelos. At the outbreak of World War II Theodorakis senior was posted to Tripolis, in the Peloponnese. The young Theodorakis was already composing his first choral works when the Germans occupied Greece. He soon joined a youth group allied to the partisan resistance and in 1944 became a captain in the partisan army ELAS. He continued his musical studies at the Athens Conservatorium but was arrested and tortured in 1945 and 1946. During the Greek Civil War Theodorakis spent months in prison camps on Greek islands where he began to compose his first symphony.

In 1952 Theodorakis married a medical student, Myrto Altinoglou. The young couple both won scholarships to study in Paris, she to study radiology at the Curie Foundation, he, composition at the Paris Conservatoire. Despite his initial success as a composer, including a commission for the ballet score *Antigone* from Covent Garden, Theodorakis was dissatisfied with the esoteric world of classical music and he longed to play an active part in the political life of his own country. When the well-known Greek poet Yiannis Ritsos sent him his poem *Epitaphios*, a lament for a young man killed by police in a street demonstration, Theodorakis immediately set the verses to music. Influenced by the popular music he had come to know while in prison, he deliberately wrote the songs in a style that he knew would be accessible to working-class Greeks. He then returned to Greece to record his song cycle, which would change the course of Greek music for ever.

The furore that erupted over Theodorakis's first popular song cycle *Epitaphios* centred on his use of the bouzouki and of a popular singer of the low-class *rebetika* music associated with the instrument, to perform his settings of sophisticated poetry. Both conservative and left-wing intellectuals thought Theodorakis had taken leave of his senses, to try to combine "highbrow" poetry with such low-class music, but the success of *Epitaphios* was immediate and lasting. In the years between 1960 and 1967 Theodorakis produced an astonishing volume of songs, setting the poetry of George Seferis, Odysseus Elytis, Nikos Gatsos, Federico García Lorca, and Brendan Behan to music. At the same time he and his fellow artists, many of whom had suffered persecution for their left-wing views, were engaged in ambitious programmes to bring art to the working-class areas of Athens. Theodorakis formed a chamber orchestra in Piraeus and wrote a number of scores for the theatre. He was also active in politics and became a deputy for the United Left Party. When his fellow-deputy Grigoris Lambrakis (hero of the novel and film *Z*) was murdered, Theodorakis became the leader of the left-wing Lambrakis Youth Movement.

During these seven years of frantic political and musical activity, Theodorakis was always looking for texts that expressed the Greek struggle for a contemporary national identity. It was Elytis, who later won the 1979 Nobel Prize for literature, who seemed to the composer to speak for his generation in his long poem *Axion Esti*. Taking the poem as his text, Theodorakis created what is considered by many Greeks to be his finest composition. The musical divisions of his setting mirrored the formal structure of the original, employing elements from all the genres with which he was familiar: the music of the Orthodox Church, contemporary classical music, folk music, and popular bouzouki music. Despite the difficulties of the classical sections of the composition, the performances of *Axion Esti* attracted a broad audience. Like Elytis's poem, the music material is rich in traditional echoes, in melodies, and rhythms deeply embedded in modern Greek culture.

The exciting blend of music and poetry that Theodorakis, together with fellow composers such as Manos Hajidakis, had established in the early 1960s, was interrupted by the military coup of 1967. One of the first acts of the dictatorship was to ban performances of Theodorakis's music and prevent sales of his recordings. The international fame brought by his film score for *Zorba the Greek* ensured that Theodorakis was only briefly imprisoned during the dictatorship, but when the regime failed to silence the composer, he and his family were placed under house arrest in a remote mountain village in Arcadia. While there, he continued to compose and managed to smuggle tapes of his work to the outside world. In 1970, suffering from severe health problems, Theodorakis was allowed to leave Greece. He and his family settled in Paris for the remainder of the dictatorship. He began touring the world to protest against the dictatorship, giving concerts of his music wherever he went and attracting, for the first time, an international audience for his songs.

With the fall of the dictatorship in 1974, Theodorakis returned to a hero's welcome in Greece, but soon became involved in bitter political controversies. The compositions he had produced in exile, including a large-scale setting of Pablo Neruda's *Canto General*, were not nearly as popular as his pre-dictatorship works. Disillusioned with his reception in Greece, Theodorakis returned briefly to Paris and talked of leaving Greece permanently. Instead, he began to compose classical music again. In the 1980s he composed four symphonies, a liturgy, a cantata, and an opera: *Kostas Kariotakis*. In 1988, following the enormous success of his ballet score *Zorba* at

Verona, he decided to write a trilogy of operas based on ancient Greek drama, beginning with *Medea*. Theodorakis's *Medea* received its premiere at the Bilbao opera house in 1991. Its richly melodic score, often drawing on the composer's early songs, contributed to its success. His second opera *Electra* was performed at the Municipal Theatre of Luxembourg in May 1995, a few days before the composer's 70th birthday. Theodorakis had always been attracted to the character of Electra, and had composed what he considered his finest film score for Michael Cacoyannis's 1962 film of *Electra*. Using some of the same melodic material but with greatly expanded orchestral resources, he produced an impressive, moving version of Sophocles' tragedy. Theodorakis was pleased by the reception of his operas in Europe, but he was determined that the premiere of the third opera of the trilogy, *Antigone*, would take place in Greece – this eventually took place in an enthusiastically received production at the Athens Music Hall in 1999.

Theodorakis has often been frustrated by the lack of appreciation of his classical compositions in his own country. Greek audiences still think of him as a writer of popular songs. In addition, his political activities, including his support for a dialogue with Turkey and his collaboration with the Turkish composer Zülfü Livaneli, have alienated many Greeks who once idolized him. Recognition of the breadth of Theodorakis's achievements as a composer and as a force for international cooperation has tended to come from outside Greece rather than inside. It was not surprising to Theodorakis that his highest honour should come from abroad: in 1996 Theodorakis was awarded the Légion d'Honneur by the French government

Biography

Born in 1925 in Chios, Theodorakis began composing his first choral works during the German occupation. He joined the communist resistance and became a captain in ELAS. After the war he studied at the Athens Conservatorium and the Paris Conservatoire. Returning to Greece, he set Ritsos's poem *Epitaphios* to music and won instant acclaim. He has composed classical music (including four symphonies and several operas) as well as film scores and popular music. He was awarded the Légion d'Honneur in 1996.

Theodore of Stoudios, St 759–826

Politician and monastic reformer

Born into a family in the upper ranks of the civil service, in 781 Theodore entered the family monastery of Sakkoudion in Bithynia which was administered by his uncle Plato. In 794 Plato made way for Theodore to become abbot and in 798 the community transferred to the Stoudios monastery in Constantinople.

Of the seven rulers whose reigns are spanned by Theodore's active life, two enjoyed his support: Irene (797–802) and Michael I (811–13). When Irene overthrew her son Constantine VI in a palace coup and had him blinded, on the pretext of his "adulterous" marriage – in fact a marriage contracted after divorce, which was legal and usually celebrated religiously in the Byzantine empire – she knew she could count on the support of Theodore, who was in exile because of his campaign against the emperor.

The remarkable aspect of Theodore's campaign against the "adulterous" marriage is that it took place ten years after Constantine's death. Nikephoros I (802–11) had seized the throne, shutting Irene up in a convent. He was probably never as ready as she had been to take Theodore's advice, but there was no open opposition until the patriarchate became vacant. Theodore, backed by his uncle Plato, had aimed at it; but when it became clear that the emperor intended to appoint a namesake, Theodore and Plato set about some underground activity (the text says no more than that) which led to Theodore's being flogged and their both being jailed until all the rites of enthronement were accomplished, whereupon they were released. Shortly after, the priest who had blessed Constantine's marriage was restored to communion and to his priestly function, in recognition of his important role in ending the war with Bulgaria. This provided Theodore with grounds for attacking the patriarch. He himself informs us that this was seen at the time as the real significance of his action: he is "accused falsely", he claims, of intending, once the priest who had celebrated the marriage had been removed from the ministry, to "seize on the excuse for bringing down the patriarch on the grounds of having concelebrated with him". Since restoring a deposed priest was authorized by the leading canonical authorities of the eastern Church, St Basil and the Council in Trullo of 691–92, Theodore unearthed a canon from an African council of 419 that prohibited the restoration of a priest who had been deposed for more than a year. This had no success, and he decided to change tack. The letter in which he informs his uncle Plato of this decision is a singularly opaque exercise in Aristotelian syllogisms, perhaps deliberately opaque in case it fell into the wrong hands. The basis is Aristotle, but the wording is in places clearly that of John Philoponus' 6th-century commentaries on Aristotle, possibly also those of Alexander of Aphrodisias (a pagan philosopher of the late 2nd/early 3rd century AD). The *Organon* is the main work drawn on, and a few quotations from the *Topica* and the *Physica* are also exclusively concerned with distinguishing between "necessary" and "contingent". Renouncing canonical attack, Theodore proclaimed it heresy to lift the ban on the priest and share communion with those who had lifted it. His closest supporters, including Plato, almost without exception,

drew the line here; the Synod said he was babbling; he promptly excommunicated the Synod. He persisted in this incredible campaign till the death of the emperor Nikephoros in Bulgaria.

In Michael I (811–13) he again found a submissive sovereign who, in disregard of his advisers but obedient to Theodore, led his armies against the Bulgars; the result was disaster. With Leo V (813–20) Theodore no longer had much say, and when Leo revived iconoclasm in 815, Theodore, who in a letter probably of 809 had defended the re-establishment of the iconoclast bishops after the Seventh Ecumenical Council of 787, since "their sin [iconoclasm] had not been over essentials", promptly reversed his views. As well as letters, three tracts against iconoclasm by him survive. The first two take the form of dialogues with an iconoclast, the third consists simply of a string of 102 syllogisms.

Homer and Euclid are the only pagan writers with which Theodore appears to have had direct acquaintance – the other references are simply jargon of the educated, though this does not prove that he had no acquaintance with those authors. His main contribution to the history of the Hellenic tradition, and perhaps to history, is the information that he supplies on the fantastic loss of documents for his period: his 556 preserved letters represent slightly less than three-quarters of the collection preserved in his monastery. Some 250 named correspondents wrote to him. Naukratios quite probably wrote as much as Theodore; one of his letters survives, 20 or so for them all. But from the many important monasteries and abbots in communion with the iconoclast hierarchy, not to mention the hierarchy itself, there is not one. One of Theodore's letters and his *Life* bear witness to a genre of which no trace is left: versified biographies. Arethas of Caesaraea speaks of beggars singing ballads relating the deeds of great men to win their favour; one can imagine some of these sending out a secretary to take the words down. But for Theodore it is stated that his first biographies were written in verse, and in one of his letters he calls for the *Lives* of the "martyrs of iconoclasm" to be written in verse.

Theodore endeavoured to enlist papal support for his battle against patriarch Nikephoros, and for his proclamation of the sharing of communion with the priest who had married Constantine VI as heresy. Two letters from him to the pope survive. The second and a letter to a "monk Basil" show that the appeal did not meet with success: "What is it to me that the pope should act this way or that? ... When he says he is not impressed by the manifest crimes of the priest, he mocks and shames [in himself] the very Head of the Church."

Biography

Born in 759 into a family that served the empire and venerated icons, Theodore entered the monastery of Sakkoudion in Bithynia in 781. In 794 he became abbot. In 795 he was exiled for opposing the marriage of Constantine VI. In 798 he moved to the Stoudios monastery in Constantinople and restored it. Exiled again (twice) he was recalled by Michael I in 821. His writings include hymns, homilies, and treatises against iconoclasm. He died in 826.

Theodoret *c.*393–*c.*466

Christian writer

Translated from his monastery to the bishopric of Cyrrhus in 423, Theodoret became conspicuous only when he sided with Nestorius against Cyril of Alexandria after the Council of Ephesus in 431. The Alexandrian delegates, pre-empting the arrival of John of Antioch with the easterners, had announced the deposition of Nestorius and declared the Second Letter of Cyril canonical – this urged that whatever is true of Christ as God was also true of him as man. In the Third Letter Cyril denounced Nestorius for refusing to accept that God could suffer in the Incarnate Christ or that Christ the man could be worthy of divine honours. The dispute turned on a hair, and in 433 a Formula of Reunion, asserting both the unity of Christ's person and the distinction between his natures, was accepted by both parties, though Nestorius gained no relief from this. On his behalf Theodoret continued to write vehemently against Cyril, whom he accused of being a follower of the Apollinarian heresy. Cyril of course demanded that the emperor Theodosius II depose him from his see, but this object was achieved only by Cyril's successor Dioscorus, whose violent partisans overwhelmed the moderates at the so-called Robber Council of 449. The subsequent controversy was resolved in 451 by the Council of Chalcedon, when Theodoret, though greeted at first with jeers and hissings by the Cyrilline party, was finally restored with acclamation.
